FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, JANUARY 27, 1887.

VOL. XXVIII.—No. 1. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications on the subject to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 30 cents per line. Special rates for three, six, and twelve months. Seven words to the line, twelve lines to one inch. Advertisements should be sent in by Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Reading notices $1.00 per line.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by express money-order, registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. For sale by Davies and Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Davies & Co., and Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, London, E.C. Foreign subscription price, $5 per year; $2.50 for six months.

Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.

BACK NUMBERS.

The demand for back numbers of FOREST AND STREAM *has been so great, and our stock is so reduced, that we are obliged to announce the following charges: For copies issued up to January, 1881, fifty cents each; for copies from 1881 to 1884, twenty-five cents each; for copies from 1884 to date, except when they are without covers, ten cents each; copies without covers, twenty-five cents each. There are some issues which we cannot furnish at all, and others of which we have only one or two copies. For these last a special price will be charged.*

WHAT WILL MAINE DO?

ON Monday last a petition was brought before the Maine Legislature praying that body to so amend the laws of the State as to make the dogging of deer lawful.

The abominations of deer hounding have so often been hailed that it is unnecessary to go over the list again. Its destructiveness, and the certainty that if it should be again put in practice in Maine the deer would soon all be destroyed, would seem to furnish an argument against legalizing it which would appeal to the meanest intelligence in all that great State. The people of that State are as intelligent as any in New England, and no doubt are as quick to see what is to their own advantage as any other community in the world. The people of Maine know very well that the game and fish found within their borders bring into the State an annual revenue amounting to millions of dollars. They know, too, that the number of those who resort to the beautiful lakes and woods of that region increases each year, and that as the game and fish, under the wise care of the present Commissioners, become each year more plenty, so the line of travel by those who desire to take this game and fish will tend constantly to increase. They know, too, that should the game and fish be destroyed in such numbers as to make them scarce, this tide of travel must diminish, and soon be reduced to nothing. The sportsman will not continue to visit empty covers and streams without fish. As the tourists become fewer in number, the dollars which they spend will also become fewer. So Maine may readily enough lose some millions of dollars each year should the selfish and foolish prayers of some of her most selfish and foolish citizens prevail.

How comes it that such a petition can be presented to the Legislature? How is it that any man or any body of men dare to bring forward a request so prejudicial to the general good? In most communities, if such a vicious measure were to be set on foot, one which takes out of the mouths of so large a portion of its inhabitants the very bread by which they live, a wave of popular indignation would overwhelm it as soon as the movement came to be known. It would be stamped out at once.

Why is it not so in Maine?

It is because certain portions of the State of Maine are cursed by a lot of most unmitigated ruffians, who do not hesitate to set at defiance the law and the officers of the law. These men are prepared to commit murder and arson and a hundred minor crimes in the furtherance of their illegal pursuits. They seem to think that the community exists for them alone, and if its will runs counter to their desires they punish the community, through its representatives, in their own way. Thus the officers of the law risk life and property when they attempt to perform their duty. Not very long ago a game warden had his buildings burned; more recently two unarmed officers were shot down in cold blood because they ventured to do their duty.

This is a shocking state of things, but it is not the worst feature of the condition of matters in Maine. More terrible is the astounding state of public sentiment there which permits such crimes to be perpetrated. Ruffians and scoundrels, murderers and incendiaries, may exist in any community, but the perpetrators of crimes are usually punished promptly, and the fear of such punishment lessens the number of criminals. In certain portions of Maine, however, it seems impossible to bring to justice those who violate the laws. A year or two elapses before an incendiary is convicted. Criminals are acquitted, not because there is not evidence to convict, but because that evidence is not accumulated, put in proper shape and brought forward in earnest by the prosecuting officer.

The State of Maine is disgraced by the condition of things now existing within its borders. Wise legislation, able and energetic commissioners, tireless and courageous wardens have given it a system of game protection which is by far the best in force in any State—a model for all others to follow—and which is of incalculable money value to its people. And yet, in some sections, a handful of lawbreakers laugh at the authorities and burn out or murder the officers of the law. Can the State of Maine stand this? Nay, more, can it throw away all that it has gained at such an expense of money, suffering and blood, at the bidding of those who have caused this expense, this suffering and this bloodshed? It cannot. We have faith enough in the strong intelligence and sturdy fearlessness of the people of Maine to feel sure that they will not allow themselves to be bullied into any such weak and foolish action by a band of criminals and their allies.

The responsibility for this attempted retrograde movement does not rest wholly with residents of Maine, nor even with the band of outlaws who have disgraced a portion of the State by their crimes. They would be less bold were it not for the aid and encouragement which they receive from people who live outside of the State, people who, occupying respectable positions, are yet willing to ally themselves in secret with men guilty of the foulest crimes. There is reason for believing that money has been contributed from without the State to influence the legislature, that men living in other States, who are greedy for the blood of the game that has cost Maine so dear, are trying to purchase the passage of the deer dogging bill through the legislature.

There is not much danger that these efforts will succeed. The actual practical benefits of protection have been so clearly proven that it is not at all likely that the people will permit any such backward step to be taken. We may await the event with confidence and patience. Meanwhile, it is the duty of every good citizen to lend what influence he can toward strengthening the hands of the Maine Commissioners and their subordinates, and toward building up a healthier public sentiment.

A MEMBER of the California Legislature has introduced a bill to legalize the killing of quail all the year round. There ought to be common sense enough among the other members to squelch such a foolish proposition as this once and for all.

A YAPHANKIAN PROBLEM.

IF IT takes the Long Island State "game protector" fourteen days to go from his home to the Brooklyn game markets, ninety-one miles, how long will it take him to go to Yaphank or Manorville, about one-fourth the distance? The answer may be six months or it may be six years. Either might be correct to judge by the immunity enjoyed by Yaphank and Manorville snarers, who have been shipping snared grouse and trapped quail to the New York market for months and months. One party in one week sent in twenty-five dozen birds. The actual definite solution of the problem, however, is not in the domain of exact mathematics, for the "protector," so far as we can learn, has not been there yet, and no one, even though gifted with second sight, can tell when he will go there.

Is not this pretty small business for the employees of the Long Island Railroad to be engaged in? Some railroad managers have had the sconce to see that passenger fares paid into the treasury of the road are of more value as revenue than the petty pickings of employees who for their own gain encourage and engage in this disgraceful traffic of contraband goods. The Long Island Railroad managers seem not to have comprehended this point, or they would put an end to the peddling of snared game by their employees.

SNAP SHOTS.

WE present our compliments to the New York *World* with assurances of the profoundest esteem, and take peculiar pleasure in announcing the engagement, equipment and dispatch of a FOREST AND STREAM National Yellowstone Park Midwinter Exploring Expedition, consisting of one man and a pack-horse. It is not the intention of this expedition to rival the *World's*, which musters twelve men all told, including "Crow scouts," with ambulances, mule teams and a detail of United States troops to go ahead and break the road. Our man and the pack-horse are, however, well hardened to the fatigue and perils of making the passage from one Park hotel to another, and we have instructed our explorer to stand by with the horse to extricate the *World* party from snow drifts, and to guard against the ignition of the *World* commissioners' Arctic clothing, should it come into too close proximity to the redhot stoves of the hostelries where they put up. As mail and telephonic communication is maintained between the Park and the outer world throughout the winter, we hope to have early advices from the two expeditions. Meanwhile, the public need have no solicitude regarding the fate of the *World* party; worst may come to worst, but we have every confidence that the FOREST AND STREAM'S Explorer and his pack-horse will see them through.

The contribution to our knowledge of the food of hawks and owls, published in another column, is perhaps the most important paper on this subject which has appeared. It certainly merits the careful consideration of that very large class who, for no very good reason, consider the rapacious birds necessarily noxious. The farmer who has lost one, or one dozen, chickens by hawks is apt to sweepingly condemn the birds of prey, never recollecting that the very bird which has destroyed one dollar's worth of poultry has very likely saved for him five dollars' worth of young fruit trees and of vegetables, which mice or insects would have destroyed. The tables published deserve careful study. It is noteworthy that among the thirteen hawks killed because "they had killed quails and chickens," only one shows evidence of having eaten such food. It would appear from such evidence as we have up to the present time, that the accipitrine hawks are those which are least beneficial to the farmer, and that the great horned owl is the only one which destroys poultry. More observations are needed, but those which have been made are extremely instructive.

There is some reason for hoping that the present muddled game laws of New York may be straightened out and reduced to an intelligible and consistent statute. There have been several conferences of the New York City Society with representatives of the game dealers, and it is proposed to attempt to draft a law to meet the approval of all concerned. The dealers ask for more time to sell certain varieties of game, and the Society is disposed to grant this. The great danger is that in the attempt to harmonize diverse interests the effect of an extended open selling season on the game supply will not be adequately

considered. It would be a grave error to license traffic in such game as woodcock at any time before the opening of the legal season for killing. Opportunity to sell openly would only stimulate the destruction of young birds now extensively carried on to supply the covert and illicit trade in them. It is a well established principle that an open season for the sale of game means a coextensive season for its destruction lawfully or unlawfully.

Abolish spring shooting. Favor every proposed law to that effect. Foster public sentiment to that end. It is no longer the part of wisdom in this country to make war on migrating game in spring and fall. One season or the other must be granted for their immunity; common sense dictates that spring is that season.

The regular annual prognostication that game has been extirpated by the severe winter weather has been made in several quarters, and it is suggested that a two or three years' prohibitory law must be adopted so that the supply may be replenished. This is timely talk, but next autumn the timely thing will be to go shooting, and there will be an abundant supply of birds, too, spite of all the cold weather we have had yet or are likely to have.

The Minnesota Sportsmen's Association is not specially active at the present time. Mr. W. S. Timberlake, of St. Paul, is the secretary, and to his individual efforts is largely due what good has been accomplished by the organization. It is to be regretted that there are not more public-spirited sportsmen in the State, for as things go now, the game laws are in a large measure a farce and laughing stock.

The Virginia Field-Sports Association numbers among its members many influential men, and there is abundant ground for the belief that in their hands the interests of the rod and gun in the Old Dominion will be advanced. Virginia sportsmen should support the Association and its course by joining the ranks and giving each one his individual aid and influence.

If the experiment noted in the FOREST AND STREAM of Jan. 13, of breeding wild pigeons in captivity, is successful, it is possible that our posterity may see some of these beautiful birds alive and outside of museums. Otherwise hardly so, considering their ruthless wholesale slaughter and rapid decrease within a score of years.

The adjective "doggy" is an abominable piece of word-making, but it appears to be coming into general use among manny and womanny correspondents on doggy subjects. The word expresses nothing for which there were not good enough terms before. Dog, kennel and canine answer every purpose.

The ruling passion is strong even in the White House. Secretary Bayard and Senator Kenna met the other day, one on his way to a Cabinet meeting, the other to a reception; and they talked bear and bear hunting so long that both were late.

Prince Henry of Battenberg is in luck. The extensive game covers at Osborne, which were once the exclusive preserves of John Brown, and have not been shot over since that worthy's death, are to be opened for the Prince and his friends.

A bill has been introduced into the Indiana Legislature to prohibit the sale of game in that State for a term of five years. Hon. Jacob Covert is its sponsor, and he deserves great credit for his efforts in support of the measure.

Col. Bob Crockett, grandson of Davy Crockett and whilom contributor to this journal, is a Senator in the Arkansas Legislature; and needless to say, he is sound on the game question, which promises to be a subject of debate.

The expedition sent out by the National Museum to secure buffalo specimens has returned with twenty-two, secured in northern Montana. The largest buffalo stands 5ft. 8in. at the shoulder.

It is proposed to start another New Jersey State sportsmen's association, with the double object of working for game protection and encouraging skill in trap-shooting. The two will not jibe.

Senate Bill No. 2436, providing for the care and government of the National Park, should be passed without fail in the present session.

The *American Kennel Register* pedigree entries closed for January with 103 additions, making the total number 4606.

The initial number of the *Audubon Magazine* will be that for February instead of January as announced.

Florida papers complain that winter tourist travel is being largely diverted to Southern California.

The Sportsman Tourist.

UNOFFICIAL LOG OF THE STELLA.

LET me premise that the Stella is a beamy, comfortable yacht of 27 tons, which makes her way through a watery world by the combined power of steam and canvas. She was well known to Eastern yachtsmen under her old name of Leila, but does not appear on the list of New York yachts under her new name. She has made two cruises from Maine to Florida, and though not speedy is an excellent sea boat and good for ten miles an hour in fair weather. She is 68ft. in length, 15ft. beam and draws when stowed for a cruise 5ft. Her best point is her roominess below. She has three staterooms and two large combination lockers, with plenty of head room and can stow seven sleepers aft and four forward. The ship's company consists of the Captain, the Scribe, engineer, mate and steward. Objects of the cruise, health, enjoyment, the pleasure of doing nothing—or doing what you please, shoot, fish, cruise, camp, avoid the Northern winter and follow the robins north in spring. Of course we make calculations, which like all "schemes o' mice an' men," are liable to "gang agley."

For instance, the Captain and the Scribe get quite enthusiastic about exploring the Ten Thousand Islands in Ponce de Leon Bay, Florida, in the Stella's gig, with the little canoe for a tender. But the Scribe does not forget that he once went to Florida with a full determination to do the same thing, and he has not yet seen the mystical islands.

It was on Christmas morning that the Stella left her moorings and headed down New York Bay in a strong nor'wester that sent the spray flying to her taffrail and soon converted her decks into a skating rink. The Scribe went below and sort o' curled himself around the cook stove. He does not like arctic weather; and the fragrance of a Christmas turkey which the steward was roasting, brought recollections of home and friends who were keeping the day on *terra firma*.

The little yacht carried her four low-headed sails with a full head of steam, and although nearly every sloop and schooner we saw was reefed down, she ran along on nearly even keel with the wind off shore and a fairly smooth sea. It was a fine run; thirty-six hours from Brooklyn brought her to anchor in Hampton Roads. We were told that some yachts, taking the inside route, had been nearly a month in reaching Norfolk from New York. It was a brisk, invigorating dash for a man who had been listlessly lying around home all summer sick with malaria, and the Scribe felt it in his bones. He proved it by appropriating a liberal share of the turkey and voting Christmas afloat a decided success.

From Norfolk to Hatteras Inlet there was a tame, monotonous run through rivers, canals and bays; tying up one night at a wood wharf and anchoring the next under the lee of Roanoke Island; but from Hatteras Inlet to Cape Lookout the run was breezy enough to delight a man-o'-war's man. We made the light just at dark, and hauled on the wind at 7 P. M. for the tail of the shoals. This brought the wind abeam, with the shoals under our lee and a stiff sea running. She rolled some. If there was anything loose that didn't bring up to leeward in a loose condition, it wasn't the Scribe. Thirteen miles of running in the trough of the sea was supposed to make the tail of the shoals. But the night was pitch dark and it was safer to be five miles off than five feet on the rocks, so the Captain gave her eighteen miles of it to make sure. Then he turned and ran under the lee of the cape until within a mile of the light we had passed five hours before. For here was safe anchorage and the Stella found rest. The steward righted the cook-stove which had fetched away, and brought order out of a chaos of upset dishes, stools, boxes, etc., while the Scribe turned in, with the firm conviction that a sudden freshening of the northeaster would have run the whole business on the shoals.

Jan. 1, 1887.—And here we are yet, and here we are likely to remain until a favorable change of weather. For the wind is dead ahead, and we can see the breakers over and beyond the sand dunes, white, ragged and dangerous. The skipper has gone ashore in full rig for shooting, and I trust he may have luck, as we are out of fresh meat and the sea air is appetizing. But the birds, which come scudding in before the wind in straggling bunches, are very wild, and a dozen shooters who come on the beach by the lighthouse seemed to have very little luck. They scattered themselves along the beach for a mile or more, but got very few shots, and finally bunched themselves for a march inland.

I do not object to spending the New Year in this snug little bay. As well here as anywhere, and the place has points of interest to a stranger. In the first place the bay is a perfect fish trap, and a dozen powerful windlasses strung around the shore for hauling nets show what the natives think of it. The fish, following the shore northward, get pocketed in the bay naturally, and in skirting the shore to escape, the seines take them in to the tune of 12 to 18 cwt. each day during the season. The fish are packed in ice and sent North with the least possible delay. So says the skipper of a little smack, which is lying here waiting for a fare; and he ought to know, as it is his sole business to get the fish to market on time. "I may, likely enough, stay here a week, waiting for a run," he said, "and you had better trust to mailing your letters yourself." For we had thought he might reach postal facilities sooner than we should. Also, we tried the lighthouse keeper, with no better result. Therefore, we have no definite idea as to when or where we shall mail or receive letters; and there is at least one of us who doesn't much care. "No news is good news." For the wind has hauled to S.W., and the balmy, soft air from the Gulf is grateful to sore lungs and raw bronchial tubes.

The Nessmuk Jr. is safely nestled in the captain's gig, and it is doubtful if she gets floated this side of Georgia, There are three months of winter weather ahead, and we have all the time there is.

And again the wind hauled to the N. E. with a sharp, chill breath that froze the decks slippery with ice. The Sunny South seems to recede as we advance. The lighthouse man comes on board, and, being entertained with hospitality, becomes communicative. "It is a desolate coast and a dreary life," he says. "It is six miles to the mainland and thirteen out to the lightship, and it's seldom a vessel passes in sight of us, they keep outside. There's little to be seen the year round but sand and water, and when a heavy gale is blowing on shore it is a wild looking place. The work isn't hard, but the pay is small and the rations smaller yet. But, it is ready money, and money is scarce here. Hunting? Yes; there's good deer hunting a few miles inland. Mr. Rogers came down to Beaufort about a week ago and he's already shot four large deer. He is a New York man; comes here every winter to hunt. No, we don't have any wrecks here. Vessels bound up the coast keep in the Gulf Stream, and downward bound they keep outside the Gulf. Only once in a while a little fellow like you runs in here for a safe anchorage."

For three days the Stella swung to her anchors in that lonely bay, and the soul of the Scribe grew weary within him. Weary of the ominous humming of the gale in the rigging, of the dismal stretches of sand, of the "great mist-jotuns" that rose and swelled and faded on the shoals, of the ceaseless roar of the breakers and the clouds of white spray constantly sweeping over the beach. But at length the wind shifted to N. W. and blew half a gale off shore, the weather was clear and cold, barometer rising, and the Skipper decided to make the outside run to Charleston. It turned out a very breezy dash of thirty-six hours, and in going around Frying-Pan Shoal the yacht was buried up to her pilot house time and again. Her behavior raised the admiration of the pilot, who declared her as good a boat of her size as he had ever handled. And it is but fair to say that she has proved herself an excellent sea boat.

It was on the evening of Jan. 4 that we moored alongside the wharf at Charleston, and the crew, who had been on duty for thirty-six hours, turned in for an all-night watch below. The weather was intonsely cold and our pilot house was cased in ice, ice on our decks, on the rigging, ice everywhere.

We are told that the weather is more severe than the cold wave which swept over the South a year ago; and a merchant remarked that it looked bad for the orange interest in Florida. We shall soon see for ourselves.

Just at this writing we are on the dry dock through an unlucky accident that happened to our condenser; but with good luck we shall get off to-morrow for an outside run to Brunswick, Ga., where we propose to stop awhile, taking in such sport as we may find on Jekyl Island, for the island is the property of the Jekyl Island Club, and the Skipper is in receipt of a letter extending the hospitalities of the club and freedom of the island for "an indefinite period of time," as Mr. Bumble remarks, and there is said to be good shooting there in the way of deer, turkeys and wild hogs.

There are several yachts lying here, all bound for a warmer clime. An English yacht, the Duke of Sutherland's; the Magnolia, steamer, and the sloop yacht Regina; the two latter from New York and both of them mainly by the inside route. The Magnolia was badly cut by the ice. Except from Norfolk to Hatteras Inlet we have managed to scrub along outside, much of the time out of sight of land, and we propose to risk open water rather than trust the tortuous shoal creeks, sounds, canals and shallow bays of the inland route.

We hope to report next from Jekyl Island. NESSMUK.

ON BOARD THE STELLA, Charleston, S. C.

MOUNTED SPORT IN CALIFORNIA.

TO the lover of outdoor sports the mere suggestion of something new is more than welcome; and when an old friend told me one morning that he had discovered a new field amusement that involved some intricate horsemanship, my interest was aroused.

"What is your novelty?" I questioned.

"Never mind," replied my enthusiastic friend, "my horse will be here in half an hour; have your mare saddled, take a light rifle, and I will show you more fields of glory than it has been your good fortune to see for many a year."

I did as he requested, and a little later we were on the way to the broad mesa that reaches from Pasadena up to the base of the abrupt Sierra Madres. I had just been reading in a morning paper of a blizzard in the East, of trains blocked by snow; and it was hardly to be imagined that we, too, were in the winter months. Christmas was but a few days away; yet the entire stretch of the San Gabriel Valley was a perfect flower garden, the scene of a perpetual struggle between the wild flowers, orange grove and vineyard.

As we left the well-beaten road and took to the mesa the flowers, in dense masses, left their pollen upon our horses' knees, and the variation of color and tint had a kaleidoscopic effect upon the eye. Here, a few weeks later, veritable rivers of golden-yellow poppies were seen winding away for a mile or more, presenting such a vivid contrast against the fields of barley upon the highland that one could well imagine that the sailors saw the glow out upon the Pacific when they named the spot the "land of fire." The air was redolent with the incense of flowers, the song of birds of almost countless variety was heard everywhere; yet this was mid-winter in Southern California. Snow there was, but well up on the grim walls of the Sierras, near enough to watch it blown about by the mountain gale, yet so far that its effect was unnoticeable in the valley. We had waded through the flower banks for some distance when suddenly that gentle animal, cycloped by science *Lepus callotis*, and more popularly known as jack rabbit, appeared. It was a vision of long ears, tints of graded gray and black, rapidly moving hindlegs and bounds of ten feet or more. The moment the animal shot from the low cover my companion's horse seemed seized with a desire to buck, but the Spanish spurs jangled deeply and he bounded ahead. My own mount followed suit, and soon we were in a wild race, the rabbit being the apparent objective. The country was fair to look upon, but the carpet of flowers concealed numberless traps in the way of gopher, squirrel and badger burrows, any one of which was, when fairly stepped into, quite sufficient to bring down horse and rider.

Both horses knew the mesa well and successfully kept their feet, but the pace was telling and the animals soon would have been winded had not the rabbit, after the fashion of its kind, suddenly stopped and stood up to see what it was all about. This gave the horses a chance, and they shot ahead, my friend reaching within 100yds. of the jack before it moved; then guiding his horse to the r

he dropped the reins and fired quickly. The rabbit bounded off, while the sportsman, assisted by a terrific leap of his mount, shot up upon his neck and slid not ungracefully to the ground, hatless and gameless, but radiant with enthusiasm.

"You see the point?" he asked, as I came up.

"And this is your new sport?" I retorted.

"Yes," was the reply, as he hauled his rifle from the brush where it had lodged. "This is the new amusement, and if the old Roman was alive who offered prizes for such things, I think I should claim one. You see," he added, "it combines the features of foxhunting, polo, steeple-chasing and ——"

"Ground and lofty tumbling," I suggested.

"That's your own lookout," retorted my friend; "My horse is, as perhaps you noticed, a little brash at the sound of a gun, but that is easily overcome; though my man tells me that if a horse has a dash of broncho in him and don't stand fire he will get worse instead of better. However, mine does well, and I will give you a pointer. If your animal won't stand it mount with a revolver in each hand and fire simultaneously: the horse won't shy because the noise comes from both sides. I had my man try this, and the animal simply rose in the air."

"Bucked?" I suggested.

"Yes, I suppose one might call it that. But I kept this up for a week or so, and after my man expended about ten dollars worth of ammunition he had her well in hand; I began myself firing from her back. At first I could not hit the stable, but finally I struck the door at 100 paces, and now I can do very well."

"But no one could ever hit a jack rabbit from a horse going at full speed with a rifle?" I said.

"It would be hard," replied my companion, "but the secret is to do it with a shotgun. I wanted you to try the rifle to merely show you the difficult side; with the shotgun it is an easy possibility, and is magnificent sport, not to speak of the amusement it affords the jack rabbit." It was evident that this addition to various time-honored sports had the elements of much excitement, and was well worth attempting. In southern California there are numbers of horses brought over from Arizona and the adjacent country which have been used to the fire of a revolver in the hands of the modern cowboy, and if one of these animals can be secured this hunter may consider himself well mounted. My search for such a horse was replete with incident. The owners of various bronchos were unanimous in the opinion that one could shoot from their backs, but as to what would be the immediate results they did not commit themselves; in fact there was a gloomy suggestiveness about their reticence on this point that was so unpleasant that I gave up the quest, and taking my mare in hand, began a series of experiments of an entirely original nature. I first led her into a large corral then approached within 50ft. of her and fired. It was evidently a novelty, as she dashed off, then came at me on a dead run, turned, and let her hoofs fly in my direction in a style that was, to say the least, disconcerting. Repeated firing did not have a soothing effect, and it was given up. The mare would now snort and rear at the sight of a gun, which she did not do before. It was evident that she was retrograding. I next fastened a long rope to the halter, held the coil in my hand, and when I fired and she jumped I let her go, then hauled in on the rope. In this way I hoped to make her leap less every time, but they increased visibly. I then tied the halter rope to her foreleg (a friend who had shot elephants in Africa gave me this point), but the only result was that she almost stood upon her head, a prophetic exhibition. I next tied her to a tree and began firing at a distance, gradually drawing nearer, shooting pigeons and quail in the brush of the mesa, showing her the game and gun, arguing silently and combining an object lesson with it all. But the mare, though intelligent, evidently had fixed ideas on the subject of standing fire, and finally, in answer to appeals from friends who were certain that my neck would be broken if I continued, I gave it up.

Some time after this I again went out with my friend, who carried a small light 12-gauge shotgun. I intended tying my incorrigible steed to a tree and shooting on foot, when right before us sprang up two of the liveliest jacks that ever gladdened the eyes of a greyhound. My friend gave a shout, and without thought I dashed in pursuit over the stubble, through a heavy plowed field, now skirting a vineyard, again into the open we went, the horses bounding along and gaining at every step. As fortune would have it they turned at the edge of the arroyo or cañon bank, and we passed them at short range. My companion's horse was fractious, and in the excitement he snapped his gun or tried to without cocking it. The next second the jack, with ears like the bare poles of a ship, was over my left shoulder, and without thought of the dire results I let fly my right barrel. As the smoke blew away, I caught a glimpse of the jack as it struck the ground, then with a convulsive leap went into the air fully three feet to fall dead or dying.

I found that I was still in the saddle, much to my astonishment, for this wily horse that had for days protested against the gun, had not moved. Her objections to powder were dissipated in smoke.

In a country where one has to walk long distances in search of game the advantage of a horse that will stand fire cannot be overestimated; and where formerly a day's shooting was hard work it is now a pleasure. Quail, dove and even deer can thus be taken, provided that he combines with other qualities that of a good climber.

In rabbit shooting from the horse one is following a precedent to a certain extent of the old Los Angeles coursing club. Twelve or fifteen years ago the American and Castilian gentry of the old Mexican city took a great interest in matters appertaining to out-of-door sports, and chasing the jack rabbit and equally agile "cotton tail" with greyhounds, was one of the pastimes of the country. The hounds were bred for the purpose, and while the packs are not kept together to-day, good dogs are still to be had. The members of the coursing club met upon the Pasadena mesa, and ladies and gentlemen followed the dogs over a country that, as I have suggested, is hardly to be relied upon, not a few mishaps occurring in consequence.

"There were some curious experiences in those days," said my friend one evening, as we rode in from the mesa, "and some queer stories worth remembering, too. There was a Mexican gentleman, from San Luis Obispo, who, as the story goes, brought an English friend down with him one of the meets. He was said to be a famous cross country rider in the old country, and was large and heavy, too much so for our horses here.

"Well, to make a long story short, the hounds started a jack and away they went, the dogs mute, but the men in full cry, the bits and spurs jangling, as fine a sight as you could see anywhere. The ground was so arranged that the party could follow for a mile, then the dogs generally turned toward the mountain and then back. The jack gave them a long run and they had two miles of it before his ears began to lay back. The dogs were well up and the horses well behind, when the animal took a sharp turn and came so near the party that the Englishman, putting spurs to his horse, almost ran over it. The Mexicans shouted to him to reach down and pick the bagged animal up, an easy trick for them. Their guest attempted it, but he had an English saddle, and the consequence was he slipped, at the same time his horse stumbled and he took a header. When the party came up to him he was sitting up rubbing his shoulder. "Where's the jack?" was the first question.

The rabbit had disappeared; but as some one gave him a hand and helped him to his feet, there was the jack crushed out of all semblance of his former self, one of the most original ways of taking the game on record.

The jack rabbit is a feature of the Western country. In Southern California they are a menace to the tree grower, and, owing to their speed, are extremely difficult to kill, ordinary dogs being unable to keep up with them. But the increase in population is fast driving them out, and in a few years there will be comparatively few in the San Gabriel Valley. In certain parts of Nevada their numbers are beyond computation. I have seen fifty or more dashing across a clearing as the train went by; and as this was repeated for miles in the low brush country, their numbers may be realized. Their tall ears give them the appearance of diminutive burros, hence the name jack; and with their powerful hindlegs that seem to shoot them ahead, they present a curious and not to be mistaken appearance. They are in many instances remarkably cunning. When they are not noticed, or the intruder pretends not to see them, they will lie low until a horse is almost upon them, then bound away in a series of leaps, astonishing in their length and demoralizing to the new hand. I have seen an old jack dash off in this way through the brush, make a circuit of perhaps 100yds., and return to within six feet of the original point, there standing on its hindlegs with ears aloft to watch me until I made an aggressive move.

I once started one in a field covered with alfalfa, and the wily creature must have understood my methods, for it kept directly in front of my horse, giving me no opportunity to fire except directly over her ears, which I did not care to do, and in this marching order we took a thousand yards of hard running. Every movement of mine to turn the horse so as to get a shot over her shoulder seemed to be appreciated by the jack that kept dead ahead, and soon bounded into the greasewood and prickly pear patch that constituted its fortress.

Popular opinion is against the jack rabbit as an article of diet, and while I am willing to champion him as running game, I am inclined not to commit myself on this point. I can say, however, that I once dined upon jack that was as fine as venison; but later attempts were from an epicurean point of view utter failures, though doubtless, if properly cooked, and served with judicious condiments, it would be very acceptable to others than the hungry sportsman.

DO SQUIRRELS HIBERNATE?

IN FOREST AND STREAM of Jan. 13 Mr. G. E. Walsh states that squirrels hibernate, while Dr. C. Hart Merriam in his "Mammals of the Adirondacks," says that they refuse to hibernate. Which is corect?

Whatever these animals may do in higher latitudes, I am inclined to think that in these temperate regions they do not hibernate, although my observations have not been sufficiently extensive nor so exact as to warrant my basing any positive opinion upon them. Of this much I am certain, however, that I have never been in our forests, even in the coldest of winter weather, when squirrels were not plentiful, and they are never more active than at this season. I have also dug out numerous nests, but have not yet succeeded in finding any of the family at home. They were not sufficiently dormant to be caught and had escaped by the back door, for the nest is usually placed beneath the snow, in an old stump or amid a pile of brush, and two or more tunnels lead from it in different directions to the surface.

MONTAGUE CHAMBERLAIN.

ST. JOHN, N. B., Jan. 17.

Editor Forest and Stream:

The house in which I live and have lived for fifteen years, stands surrounded by old forest trees, such as oaks, hickory, chestnut, etc. When I built the house the wood abounded in gray squirrels, which have continued to dwell here on terms of friendship with all our family excepting the dogs and cats. As I now write four wild squirrels are seeking their dinners of hickory nuts on the ground within 30ft. of me, and a pair of them have reared their young several times in a hollow chestnut tree that stood 20ft. from my window.

I once put a long ladder against this tree and examined the nest while the mother squirrel was off on a visit. The nest contained five young about half grown. I did not disturb them, but on coming away left the ladder against the tree, went into the house, stood at the window and watched. In about five minutes the mother returned and, after deliberately inspecting the ladder, ascended to her nest, a moment afterward reappeared with one of her children held in her mouth, as a cat carries her kitten. She then descended the tree, still bearing the youngster by her teeth, and carried it to another hollow tree about 200ft. away. This operation she repeated until the entire family was removed.

I have, of course, studied the habits of these graceful and intelligent animals carefully, and can state it as a fact without any kind of question, that the Long Island gray squirrel never stores away a supply of food for the winter, but forages every day for food. He never hibernates, and appears just as lively with the temperature at zero as at any other time. As I said, he never lays by a store for winter use, but in the autumn when nuts are on the ground he has a habit of burying single nuts here and there in the woods, apparently in a haphazard way, but when the deep snows of winter come you will see him dig up those same nuts for his breakfast. He never makes any mistakes, and even if the snow be a foot deep, wherever he stops and digs, there he finds a nut, and at once ascends the handiest tree to eat it.

With all his little taking ways the gray squirrel is in some things a thorough rascal. He robs our birds' nests and eats the eggs. His appetite seems to be omnivorous. One of his favorite side dishes consists of grubs, and if you offer him a pint of chestnuts he will carefully select a nut with a fine fat worm, eat the latter and search for more.

THOMAS CLAPHAM.

ROSLYN, L. I., Jan. 22, 1887.

FOOD OF HAWKS AND OWLS.

IN March last we published a report by Dr. B. Harry Warren, of West Chester, Pa., bearing on this question, "Are hawks and owls beneficial or injurious?" With this report were a number of letters from some of our most eminent ornithologists, expressing in very decided terms their opinions on this question. There was but one sentiment among these gentlemen on the point at issue, and this was that the birds in question were beneficial. Since the publication of the report, Dr. Warren has continued his investigations of this interesting subject, and has tabulated the results which we are permitted to give below. This report will be printed as the report of the West Chester Microscopical Society. All the hawks recorded in the following table were taken in Chester county, Pa. An X in any column means that the food heading that column was found in the stomach.

**Red-tailed Hawk.—"Henhawk," "Big Chicken Hawk."* Buteo borealis. Gmel.

Dr. A. K. Fisher, Assistant Ornithologist U. S. Department of Agriculture, Washington, D. C., in a letter dated Jan. 15, 1887, addressed to Dr. B. H. Warren, says: "Wednesday I received eight adult redtails and two red-shouldered hawks from a man in Maryland. * * * I find nothing but mice and shrews in their crops and stomachs (from two to five in each). I found two specimens of *Sorex* and the following specimens of mice: *Mus musculus, Hesperomys leucopus, Arvicola riparius*

*The tables giving food materials of different species of hawks refer only to the birds on which bounty has been paid under "Scalp Act."—B. H. WARREN.

Since the above has been written forty odd hawks and owls on which bounty has been paid have been examined; one bird, a red-tailed hawk, was found to have fed on chickens only; a second example of the same species had in its gizzard remains of a chicken and portions of a field-mouse. Two red-tailed hawks had fed on red squirrels, another pair of red-tailed hawks had taken rabbits. Eight sparrow hawks, included in this series of forty odd birds, revealed chiefly mice and grasshoppers. The remainder of the forty odd birds, ten of which were screech and long-eared owls, had in their viscera chiefly field and meadow mice. The owls, with the exception of one screech owl, that had in its stomach an English sparrow, had all subsisted on mice and insects, principally grasshoppers.—B. H. WARREN.

†NOTE.—The gizzard of this bird contained a few hairs of field mouse and some long black hairs which appeared very much like that of a skunk. The bird on dissection gave a very decided odor of pole-cat.

and *Arvicola pinetorum*. The hawks had been killed because they had 'killed' chickens and quail."

We are fortunately in a position to furnish an authoritative statement of the stomach contents of thirteen hawks, among which are the ten above referred to. All these are from Montgomery county, Md., and were killed between Jan. 5 and 14, 1887.

Sex.	Species.	Stomach Contents.
♂ ad.	B. borealis.	1 pine mouse (Arvicola pinetorum)
♂ ad.	B. borealis.	2 meadow mice (Arvicola riparius)
♀ ad.	B. borealis.	A. riparius and Hesperomys leucopus remains
♀ ad.	B. borealis.	2 Mus musculus, Arvi. & Hesperomys remains
♂ ad.	B. borealis.	1 shrew (Sorex), 2 M. musculus, Arvi. remains
♀ ad.	B. borealis.	2 A. riparius
♂ ad.	B. borealis.	1 Sorex, 2 Arvicola riparius
♀ im.	B. borealis.	3 Arvicola riparius
♂ ad.	B. borealis.	Stomach entirely empty
♂ im.	B. borealis.	3 meadow mice (A. riparius)
♂ ad.	B. lineatus.	2 M. musculus, 1 Hesperomys, Arvi. remains
♂ im.	B. lineatus.	1 house mouse (Mus musculus)
♀ im.	A. cooperi.	Remains of quail (C. virginianus)

A more careful examination, which will be made later, will probably increase the total number of mice by half a dozen.

Long-eared Owl.—"*Horned Owl,*" "*Cedar Owl.*"
Asio wilsonianus. Less.

Sex.	Date.	Locality.	Field-mice

♂ ad.	Jan. 12, '84		X	X		Beetles & chick. feathers
♀ ad.	Jan., '80	X				

From these tables the Committee of the West Chester Microscopical Society concluded that with rare exceptions the hawks are beneficial rather than prejudicial to the farmer, the small amount of damage done being greatly overpaid by the destruction they cause of animal and insects injurious to the farmer.

The observations of the habits of owls indicate that they are particularly beneficial.

The Committee also made inquiries of the Commissioners of the different counties as to the number of birds and mammals that have been killed and for which bounties had been paid, and received answers up to July 1, last, from thirty-four counties. The number of hawks killed and reported up to that date was 9,237, at an expense of $7,365.10, and of owls 2,499 at an expense of $1,303.90.

In many cases, however, the fees of the magistrates were not included, but merely the bounties paid on the birds. The bounties raised for minks, weasels, foxes and wildcats, raised the sum reported to $15,165.95.

As the time included in the returns does not come down to date, and as only 34 out of 67 counties made reports, it is believed by the Committee that the counties pay annually not less than $50,000, under the law of 1885, of which the largest part is paid for the destruction of hawks and owls. That they are the best friends of the farmer, and that their destruction is to him a great disadvantage, the Committee thinks that it has already shown, by the letters of eminent ornithologists in its report of March 4, last.

The results of these examinations should certainly induce those who have been prejudiced against hawks and owls to modify their sweeping condemnation of these birds.

At the meeting of the Linnæan Society of New York, held on Friday evening, Jan. 21, there was a general discussion of the food habits of hawks and owls, preceded by a paper read by Mr. L. S. Foster, entitled "A contribution to our knowledge of the food of hawks, owls, jays and crows."

Mr. Foster drew his data from reports recently sent him from twenty-five American ornithologists widely scattered over this country, and evidently brought to his work an unprejudiced mind.

The following tables contain some of the testimony he presented, and the results of his investigation of the food of hawks and owls lead those present to a high appreciation of the service of these birds in behalf of the agriculturists, and the belief that few species, if any, deserve the contents of the farmer's gun.

That the prejudice felt against hawks by many farmers is not universal is shown by a communication in the *Cultivator* and *Country Gentleman* as follows:

Samuel Miller states in the *Rural World* that he had a young orchard in clover, and the mice being abundant there was much anxiety for the safety of the trees on the approach of winter. But several hawks were observed there every day, swooping down into the dried clover and reducing the mice. With this aid from the hawks, clearing the grass away from the trees, and treading down the newly fallen snow about the stems, not one of the fifty trees was injured. Not every one can command the assistance of these valuable birds, but every owner of young orchards may adopt the two last-mentioned remedies. We have seen over one thousand young trees in an orchard girdled in three days under a fresh fall of snow, and those who have not protected their trees with smooth solid mounds of earth should take the next best remedy.

NEW BRUNSWICK CARIBOU.—Fredericton, N. B., Jan. 19.—Henry Turnbull, who is engaged in hauling spruce logs on the Taxis, a branch of the Miramichi River, fifty miles from this city, on the 10th of this month, saw a herd of six caribou on his logging road; only one had horns. Where he is working, at this season, these animals remain about the banks of brooks running through low lands where such streams have overflown their ordinary channels and thus consolidated the snow, which is now 5ft. deep on the level in that part of the country, thus enabling them to walk with greater ease than in the deeper snow on the ridges. On the same day on which Turnbull saw these six caribou, the man who was engaged in chopping at the browse on the stream saw two more. Turnbull also says that sable are more than ordinarily plentiful where he is at work. His men who are engaged in chopping take their dinner with them, and when noon comes, kindle a fire and boil their tea kettle after the fashion of the northern woodsmen, and eat their dinner of bread and pork. When they return to the same place the next day they generally find that a sable has been there during the night and gathered up any fragments that may have been left. The caribou seems to have different times for shedding its horns; a very reliable friend of the writer on Feb. 7 last, saw, on Mount Katahdin, in the State of Maine, four of these animals with large horns.—EDWARD JACK.

POOR "ROBIN A DARE."—The notes of "Robin A Dare" in your issue of last week were rather far-fetched as regards Lockport, inasmuch as about the same hour that the paper arrived here poor Robin was handed to me by a gentleman who had seen him drop in his yard, and on going to it found he was dead. The verdict given was "that poor Robin had starved to death," as there was nothing in his crop (and what was worse he had no crop). But the probability is that he froze to death, as he was in good condition, weighing 2¼oz. He had (a) dared too much when he essayed to brave the rigors of our western New York winter. There is no doubt that the few that remain here find enough crumbs and scraps thrown into the yards to eat. But a few mornings since, I saw one feeding in my yard before it was fairly light, showing that in winter as in summer, they go on the principle "that the early bird catches the worm." And I do not know of a bird that is earlier abroad than the robin.—J. L. DAVISON, (Lockport, N. Y., Jan. 17).

THE ENGLISH SPARROW.—The State Farmers' Institute held its first session in this city last week, and among the most important questions asked was "what was to be done with the English sparrow?' The answer was "kill them." It was a good resolution, and should be carried out. Winter is the time to do it, when there are no other birds about to be disturbed, and now, when they are in flocks of thousands, as I saw them yesterday and to-day flying from place to place about the city, and as I see them gathered together about this time every year. This winter the flock is double what it was a year ago, and if there is nothing done, what will it be five years from now? I certainly think it is of more importance to the farmers than any other question raised during the sessions of the Institute.—J. L. DAVISON (Lockport, N. Y.)

HABITS OF THE BEAVER.—Cache Creek, B. C.—*Editor Forest and Stream:* In looking through one of Messrs. Routledge's publications I noticed an article on Nova Scotia, by Lieut.-Gen. A. W. Drayson, R. A., in which the following passage occurs: "Two pine trees, growing side by side, will be cut down by the beavers' sharp teeth; the trees are counterparts of each other; the beavers will devote half an hour to running over one tree which they then will drag into the water and it will sink; they will then drag the other tree in the water and it will float." The writer, as authority for this statement which he evidently believes to be a fact, cites certain Indians and French Canadians. Can you or any of your readers acquainted with the habits of the beaver, throw any light upon this curious matter?—R. M. C.

OPOSSUMS ON LONG ISLAND.—Roslyn, L. I., Jan. 22.—A few evenings since, one of my boys met a 'possum in the middle of the highway, and only a short distance from the house. The 'possum did not attempt to retreat but faced the boy, who hit him a whack with a stick, picked him up by the tail, and brought him to the house alive; the animal weighed 11lbs. We cooked him, and don't want any more. Since September last more than a dozen 'possums have been taken in this vicinity. They are getting more numerous from year to year.—THOM. CLAPHAM.

A WOODPECKER'S NEST.—Philadelphia.—When in the country two weeks ago I found a woodpecker's home (deserted, of course) made in rather an odd way. A large limb had been split from the trunk of a tree some distance, and where the opening was about 2 in. wide the bird had bored its hole from the heart to the outside about four inches and then downward as usual. The hole was about 1¼in. in diameter and (supposed) 18in.—H. LOBEE.

MICHIGAN WINTER BIRD NOTES.—Grand Rapids, Jan. 19.—Several species of birds have been seen here late which are uncommon in this locality in mid-winter. They are: Several snipe, Dec. 24; one meadowlark, 30; one woodcock, Jan. 1; one red-headed woodpecker, Jan. 3; one red-shouldered hawk, Jan. 6. Several seen singly the first part of January. The mean temperature for the first ten days of this month at noon was 8½ .—E. L. MOSELY.

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—Purchased—2 polar bears (*Ursus maritimus*), 1 rufous wallaby (*Halmaturus billardieri*), 1 black wallaby (*H. wilcoxi*), 1 black-striped wallaby (*Halmaturus dorsalis*), 1 tailed kangaroos (*Petrogale penicillata*), 1 aoudad (*Ovis tragelaphus*), and 6 undulated grass parrakeets (*Melopsittacus undulatus*). Presented—1 white-throated capucin (*Cebus hypoleucus*), 1 white-nosed coati (*Nasua narica*), 1 opossum (*Didelphys virginiana*), 1 solenodon (*Solenodon cubanus*), 1 lory (*Lorius torquatus*), and 2 red-tailed hawks (*B. borealis calurus*)

Game Bag and Gun.

Address all communications to the Forest and Stream Pub. Co.

ELK IN THE RIDING MOUNTAIN.

ELK there are in the Riding Mountain, but of little cheer is this to any but the Indian, whose time being nothing, can camp upon the trail, and thus by more than "dogged" perseverance some time come up with the game. It is the noisy hazel brush that hinders a man in any haste from being able to approach his quarry. Indeed this drawback holds in hunting the jumping deer, the blacktail, and the moose, but interferes less in coming up with the moose by reason of the altogether different mode of approach. Even with a suit of the Hudson's Bay duffle, which is exceedingly heavy woolen goods resembling blanketing, but being much heavier, with long nap, as little likely to create a rustle as a beaver skin—even with this soft, feathery suit one cannot make noiseless movements. The hazel rods and limbs will switch and scratch and screech, sawing across one another as you push a passage through.

A band of elk will lie well surrounded by these noisy signals, and will also stand to calculate in such places after having been disturbed. This advantage, together with standing up tip-toe high on the best points for outlook, and being able to look so penetratingly, insures this game against the following of any impatient hunter.

That piercing power of vision possessed by the elk is known to those who have paid, by experience, so dearly for the learning, or by those who have made the eyes of deer a study, it being conceded that the animals with the little bare tear course drained by the aperture from the outside into the nostril have the strongest vision, and can look for the greatest length of time steadfastly at a given mark, and are less affected by wind or anything which causes sight to weary or to blur. Well, with such eyes and with such tell-tale hazel brush the elk might be presumed to be, roughly speaking, safe.

It was afternoon when the Poet and myself from one point of the compass arrived, the other two members of the party having come from the opposite direction and pitched the tent. In addition to pitching the tent the boys had been out on the reconnoiter, had discovered and surprised the enemy, causing the "redcoats" to beat a double quick retreat. After a hasty dinner or "snack," we all assembled on the field of bloodless interview, now two hours silent since the advancing, surprising, charging, struggling for position, and final stampede, all of which was portrayed with demonstrative exactness and particularity to us of the detachment who had brought up the rear. We of recent arrival took our orders and all proceeded, covering a line of half a mile in breadth, certain that by keeping the trail between the two center men we should come up with the game, which to the two parties of the first part appeared so stupid as in twos they stood up against the sky on some promontory like a team of horses 17ft. high, even the two small ones were avowed "as big as any mules." The Poet inquired if the comparison was not with horses 17 hands high, but the excited narrator returned a hasty and chilling look which unequivocally reaffirmed the original terms as true. How perplexing to find that after tearing through hazel brush from bluff to bluff, the only chance for outlook, and where we expected to find the bucks which stood 17ft. high, with massive, branching antlers, presenting a large mark for a long shot, that we were round near camp, and that the shades were beginning to stretch and would soon reach us.

Yes, these four or five elk had run from height to height and circled as they ran, passing within a few hundred yards of our camp. The two inside men met on every hilltop to look and to confer, and from them we outposters received details at supper of how those fabulous creatures ran, and stood and pawed, and leaped and—left. Upon coming into camp we put on our overcoats of fur, turned up the lapels which reached quite above the ears, pulled on our fur mittens, mine fur-lined, and proceeded to prepare our meal. And so, "spruced up," we ate it; and thus we turned in with feet in two pair of woollen stockings, a pair of felt socks and moccasins—some of us wearing one or two pairs of insoles besides. It is interesting how quietly 62° of frost will change one's opinions about his being "hardy." Our bread stayed frozen though we sat so near that howling fire that our cheeks were slightly scorched. With the tent door near to those large hardwood logs inclosing the bushels of sparkling c[illegible]ls we slept. Beds of evergreen boughs, with a ground b[illegible]nket, two pairs of woollen blankets and a buffalo skin [illegible]or two was the rule. In such a temperature one wonder[illegible] at the smallness of the measure of warmth in the huma[illegible] frame. Every two "spoon it," you better believe. W[illegible] slept and waked and arose and built fires—which had [illegible]en frequently renewed during that long night—and [illegible], and started.

On the way to take up our elk trail and just at peep of day, the Poet saw, or thought he saw, deer hide. We all heard the tramping, and upon the order being given by one of the boys to "fire," that rifle went up and belched forth flame, lifting up an awful voice simultaneously. A bleat and frightened yell combined fell upon our ears from three rods distance, unmistakably coming out of a terror-stricken man. Not one of us could speak or move or breathe—for hours, it seemed. "Hello," cried the tall lean man of our crew, "what were you doing up that tree? You don't want to play wildcat else you'll get shot." As we stepped out there stood one of the provoking idiots who go into the woods in deer skin coats. Upon seeing him some of us wished that he had been shot as an example, and we had the heart to shoot him then, but for the unpleasantness on all sides that might ensue, although the fool deserved to be more than shot. How ineffably silly to dress in deer costume even to approach the deer. It is motion, not color, that attracts a deer's attention—more on this again.

It is enough to say that we were all converts to the white-suit theory for deer hunting, and we have not apostatized in faith. A white suit has the advantage on a hillside and in some other instances without the probability of being held dead upon by some hasty, or even cautious marksman. Again, in a party one does not miss shots through fear that the brown object is his companion's old dun coat.

How came it that the Poet missed his man three rods away? A twig certainly deflected the bullet for the Poet would put the bullet on such a mark at 200yds. conditions being favorable. For a fact, that mortal never knew that he was shot at, and never will. He was so much ashamed at having bleated, so frightened like, that he asked no questions, and we told him no—impromptu histories. We were in no courting humor and made no long stories, but pushed along to take up the trail and do as famously as we had done execrably the day before. The severe part of this remark refers to the members of the party who stood arguing about elk and "Hopkins's big bay hosses," until the elk and hosses became identical and more than hopped into the hazel and were gone.

After taking up the trail the difficulties connected with making time, and with determining, in a few inches of that light snow, which way the game was going, together with the mixing of tracks, old and older, when it is so difficult to determine the age of a track unless it is very fresh, sorely worried us. Many, many miles we traversed but not in a line direction. One of the party took a track, followed it, and upon abandoning it at last swung to the left to take up the trail of a greater number of the game when he struck the camp. Infuriated at this additional reverse he hastened back two miles and began again. After deciding that the tracks were going south the proper thing to do is to say, therefore, the game was going north. This is another way of stating that where the foot enters the snow looks like where the foot came out, judging by Eastern standards of moist snow.

Well, the forenoon's experiences were imitated somewhat closely even to the extent of stumbling upon the camp by mistake, having made this left hand turn again on a larger circle.

When I registered at the camp the second time against my will I was truly humiliated. The boys may never know that one of them did something quite so slack. I don't want to lower their good opinion of the party. Each man returned, having "cork-screwed" the whole mountain over without having seen or heard either elk or Hopkins's big bay hosses.

We were not sorry that engagements hindered us from repeating these most provoking experiences. Our report, hence, was that we "Hadn't more'n got bearn's when time gin eout," but the secret is so did we. HURON.

MAINE GAME LAW.

Editor Forest and Stream:

What should be done and what will be done during the present session of our Legislature interests all true protectionists in Maine. It is sure that most herculean efforts are being made to abolish the whole by the poachers.

We have had most diabolical and wicked acts committed by the poachers in this part of the State during the past two years, which ought to convince all reasonable men that there is but one way out of this dilemma, and that is, hold what we have; make minor changes with great care; give the Commissioners money and men to enforce the laws to the letter; and I would suggest in addition that there be a contigent fund appropriated to aid in the protection of life and property of wardens, and in bringing to justice those committing crimes against them. The last session of the Washington county court ought to convince any one of the need. Our blood has not cooled since the murder of Hill and Niles, and to hear such a yell as went up from the poacher corner of the court room when the foreman of the jury in the McFarland trial announced the verdict of "not guilty," was enough to arouse the indignation of all thinking men, for it shows the true animus of those who are now trying to break down our fish and game laws. What have they done? One of the most horrid of tragedies is theirs. It does not change facts because McFarland has been acquitted, nor do I say he ought to have been convicted on the testimony against him, but the demonstration was most cruel to the wife and children of poor Hill, and could not have emanated from any save those of most cruel hearts.

The facilities afforded for administering our criminal law do not seem equal to the emergency at this time when crime is rampant and so large a class of lawless men on the move.

I also believe there is a combination of poachers which extends from the Penobscot to the St. Croix, and to meet this crowd is what protectionists must do this winter. May all be wise and on hand to do their duty.

I can do no better than give the facts in one case that came up at the last session of court in Machias to show the cold-hearted wickedness of this crowd. In the cases of the two men convicted of burning Warden Munson's buildings the law court overruled the exceptions in the Devereaux Fenlason case and reported a few weeks before court, whereupon a conspiracy was planned to stay proceedings. A motion for a new trial was expected to be made on the ground of new evidence and the alleged discovery of the real criminal. Allen Fenlason, one of the main witnesses for the State, was arrested and incarcerated and many Shackers summoned to appear against him, but the plan was apparent, for a portion of the number testified at the trial and conviction of Day, when the attempt was made to clear Day, on the ground that Mrs. Munson, her brother and uncle burned the buildings for insurance. Some of this number said: "We knew Allen Fenlason burned these buildings when we swore against Mrs. Munson." It is needless to say the Grand Jury found no bill against Allen Fenlason. Can such a conspiracy be equalled by any, save poachers? Are innocent men to be convicted by perjury to save two notorious convicts from prison? Motion for new trial abandoned and Devereaux Fenlason was sentenced to twelve years of hard labor in State prison. Law Court has not yet reported in the case of Wilber Day, convicted of same crime.

Counsel in the McFarland trial endeavored to prove Graves's dog a bird dog or an ordinary cur and that the attempt of the wardens to kill this dog was enough to reduce the murder of the wardens by Graves from murder in the first degree to manslaughter. Have we not a right from this to infer that the life of a mean cur is worth more than that of a warden in the estimation of poachers? Will Graves be arrested? Where is he? He is in the hands of his friends, the poachers, and should he be arrested, unless the State of Maine takes the thing in hand and gives extra aid, he also will be acquitted.

PROTECTIONIST.

JANUARY 19, 1887.

FROM THE DUMPING GROUND.

NO better illustration of the true position of Boston marketmen on the question of selling game at any and all seasons need be asked for than has come to notice within a few days. The fact came up in the Legislature, now in session here, that some amendments to the fish and game laws would be asked for. This was sufficient to sound the alarm, and immediately a special meeting of the Chamber of Commerce was called to take action on the subject. The meeting assembled on Wednesday. Who were there? The same old couple of dozen of game dealers. The only wonder is that this important trade organization will allow its name to be brought down so low as to foster a meeting involving the interests of so few of its 800 members. But the attention of the majority has never been called to the nature of what the game dealers desire. The result of the meeting was to talk over the dangers that the business of selling game out of season in the States where killed, and hence illegal, was in from the fact that the "society of gentlemen"—the Massachusetts Fish and Game Protective Association—proposed to ask the Legislature for some sort of changes in the game laws. In sentiment the voice of the meeting was that "we must be prepared to fight them." A big committee of ten was chosen to take the matter in hand, and it was curious to note that the committee included about every noted game dealer in Boston, except two or three, who are members of the "society of gentlemen." That committee held a meeting on Monday to organize, and as it was a secret meeting, or included only the members of the committee, the affairs have not yet become common property. But it is understood that all legislation looking toward the stopping of the holding and selling of game whenever it can be had to sell is to be fought to the bitter end. So it is. The interests of not more than a couple dozen men puts the whole fish and game protective interest of the State in danger. Of the State, did I say? Indeed, of every State, almost, in the Union where there is any fish and game to protect. All the Western game States contribute to Boston as the "dumping ground." Game can be sent here and sold here when it cannot be exposed for sale in the State where killed. The close time draws near. The unsold game is shipped to Boston, and Boston gets a flood of it. A single Minnesota concern has sent over 100 deer to this market within a week or two. Boston marketmen buy this venison very cheap. Last week not above 10c. per lb. for whole deer, and a good many lots were bought for 5 and 6c. But the marketmen are very reticent about what they pay. There is a profit in the business. For a piece of venison to roast they ask 25 or 30c. per lb., while venison steak is worth 30c. It is true, however, that these prices have just been broken by the surplus of deer which have been received.

Now, brother sportsmen, is not this an eyesore? Isn't here a plague-spot? But how shall we get rid of it? These few marketmen have every winter, for years, succeeded in making the Solons who assemble on Beacon Hill believe that they have an inalienable right to deal in that which is illegal in other States; to encourage the poacher and the market hunter to push even the last deer to extermination; to hold 300,000 quail, bought of these market hunters, in refrigerators from January to August; to be absolutely driving the last vestiges of game out of the country. All this they are able to do simply because a man has a right to trade. Well, has he a right to trade? Has he a right to exterminate by his trade [illegible] that which belongs no more to him than to you, good [illegible] reader?

The prospects for wholesome fish and game legislation in Maine are improving. The committee has got to work and a good many "leaves to withdraw" will be granted now that the hearings will begin to come off. In no [illegible] the number of absurd and ridiculous petitions that we may [illegible] mittee will receive is numerous. But unlike Massachusetts, fish and game protection in that State has become part of her creed, as it were, and petitions looking to the interests of the trader, the market hunter and scatter-sworn enemy of all protection, will respectfully [illegible]smen as a the go-by, and the petitioners will walk out of [illegible] mittee room feeling that their mission to Augusta might as well have been to Africa. *adv.*

There is very likely to be some good legislation on the lobster question. It appears that the testimony of an expert, or one thoroughly versed on the subject, is being employed. This expert gives out the following facts and figures: In 1886 eleven factories canned 11,320,000; 27 smacks sold $2,700,000; New York smacks bought 2,000,000; total catch, 23,020,000. He thinks 25,000,000 would be a safe estimate. In his judgment, the lobsters have diminished in size, as well as in numbers. Smacks that used to carry 1,500 to 2,500 now carry from 4,000 to 7,000. There are about 16 factories on the coast of Maine; 27 smacks of from 16 to 60 tons burden, and a large number of men are engaged in shipping in barrels. Several large New York smacks come each spring, and with the exception of a few who run to Nova Scotia, the whole drain comes on the coast of Maine. He believes that some wise law should be passed by the present Legislature and rigidly enforced. This, he says, will prevent the lobsters from being exterminated or the fishery rendered unprofitable in a very short time. SPECIAL.

THE MAINE DEER WARDEN CASE.—*Editor Forest and Stream:* A word in reference to the recent Maine tragedy. As I understand the case, the game warden finds two men, accompanied by a hound. The warden demands that the dog be delivered to him, and being refused, resorts to force and is shot. Is the presence of a hound in a hunter's camp or in company with hunters *prima facie* evidence that the hound is to be used or has been used for tracking deer? Does presumptive evidence by the Maine statutes warrant a conviction in a case of supposed deer hounding?—C. P. W.

A TAME RUFFED GROUSE.—Morris, Ill., Jan. 18.—The ruffed grouse I wrote about in issue May 6, 1886, as visiting one of our barnyards occasionally, taking food from the hand, and jumping upon the lap of the person feeding it, returned with a brood to her old quarters at the setting in of cold weather. She proved to be a female as I predicted. Quail are very nearly wiped out in this part of the State; I have made numerous inquiries and hear of but two small covoys of a half-dozen each. Prairie hens are in considerable numbers and are wintering well. Snow a foot deep, weather cold.—M. H. CRYDER.

VIRGINIA FIELD-SPORTS ASSOCIATION.

THE proceedings of the first meeting of the Virginia Field-Sports Association at Richmond, Oct. 21, 1886, have been published in pamphlet form. In their introductory note the officers of the Association explain the character and purposes of the organization as follows:

The character of our members is a sufficient guarantee that the movement is in the hands of responsible and earnest people. We are most fortunate in having our membership very well distributed throughout the State, in all sections. Every man in Virginia is interested in the question of game preservation, whether he be a sportsman, a farmer, a countryman, or a city man. Unless intelligent measures are promptly organized the day is not far distant when our game supply will be exhausted, and cannot be replaced.

There is nothing to which the proverb, that a stitch in time saves nine, applies with more force than to the preservation of game.

Local organizations are well enough, but they do not reach the case. What is needed is a State organization, with an admission fee so small as to admit everybody to membership; with its ramifications extending into and influencing all portions of the State; creating and fostering an intelligent and healthy public sentiment. If such an organization is established, it can, by correspondence and inquiry, ascertain what is necessary to preserve game; it will teach the people that such laws are not enacted for oppression, but for their own protection; and it will give us earnest men everywhere to see that the laws are not enacted at hap-hazard as they have been, and that they are not, because they are bad laws, brought into contempt and disuse by the people.

Such an organization as we propose will go before the Legislature of Virginia with laws which have been prepared by men who have studied the question, and containing provisions for each section of the State, framed after full conference and advice with the most intelligent and interested of their population.

The Legislature will listen to and pass laws of this character, and when they have been passed, the Field-Sports Association will take proper steps to have the laws published and enforced in the communities to which they are intended to apply.

Now, if such a law can be secured, how beneficial will it be, compared with the silly, neglected, and incomprehensible laws now on the statute books.

To bring about that result is our leading object, and it can best be obtained by the generous response of our fellow-citizens who have the same interests as ourselves in this question.

We appeal to you, individually, to join the organization, and give us the benefit of your name, sanction and influence in your community, to excite an interest in the question of game protection. The other features of the Association, while incidental to our main objects, render it a very pleasant organization. JOHN S. WISE, President.

BARTON H. GRUNDY, Secretary.

GAME IN NEW HAMPSHIRE.

"MORE deer have been seen in the central portion of the State the past summer and fall than before for twenty-five years," Mr. E. B. Hodge, the energetic and fearless game and fish commissioner of New Hampshire, and superintendent of the State hatching house at Plymouth, told a Manchester *Mirror* reporter, last week. "Deer have been seen the past summer as far in toward the center of the State as Alexandria. Two were shot there the past fall. They were also seen in the towns of ——mpton, Ashland, Holderness, Plymouth, Rumney, Dor——ster, and in most of the towns as you go further north. *Great*——r Rumney three or four were seen together at one

First f——In Dorchester one came to an oatfield, and was so one from ——hat it approached within two or three rods of the ——ho owned it. They were common in Conway and

Sex. | ——equently seen from the car windows on the Port- Da——Ogdensburgh Railroad. The increase in deer ——————he past three or four years in New Hampshire ——s really wonderful. As much progress has been ——Prince His direction as in any other branch of the game laws. ——ere is no reason why it could not be made one of the best deer hunting States, if men could be induced to let the deer alone in the time of deep snows. The slaughtering of them at this period of the year is what thins them out. When the snow is deep they go into yards, and then they are easily killed by lawless hunters. Last winter nearly twenty deer were killed in one day, in one yard, in the town of Bartlett, but in this case we made it hot for the parties. We secured eight convictions, while three of the guilty parties skipped to Maine. The great trouble the commissioners have to contend with is the disinclination of people to give information against those whom they know are guilty of a violation of the game laws. Let a commissioner go into a strange town, and if it is ascertained what he is there for, it is almost impossible for him to get evidence that will lead to conviction. However, I feel encouraged at the progress that has been made during the past few years. Between June, 1885, and June, 1886, the commissioners secured the imposing of between 500 and 600 fines in the State, for the violation of the game laws; from last June until now, not a single case has come before the courts. I do not say, mind you, that there have been no violations, but they have been so few comparatively that they have not come out. Fully 200 deer were killed illegally in this State last winter, and yet more deer were killed legally last fall than ever before, which shows the possibilities of the sport, if the animals were hunted only in the open season, from Sept. 1 to Nov. 1. There is an immense quantity of cover for deer in the central portion of the State, and if we can succeed in stopping this hunting and wholesale slaughtering in the winter, New Hampshire will, in a few years, become a great deer-hunting State. Speaking of tameness of deer, I knew an instance last fall where a deer came every day within a few rods of a man's house, and he had chance after chance to shoot him. The law was off, too, but the man didn't know it, and so the deer escaped. When the man found out afterward that it would have been perfectly lawful for him to have killed the deer, he felt very sore indeed.

"The men who kill deer out of season usually cut off their hindquarters and eat them and destroy the hides. There are a lot of cases, however, where deer are murdered in the woods, where the snow is too deep for them to run and escape, and left. In such instances they are killed out of pure cussedness. A case happened last winter where a doe, heavy with fawn, was killed and cut open, letting out two live fawns, and the brutes who did the work ate the meat. What do you think of that? Did I catch the offenders? Well, I did, and they had the law put to them to its fullest extent. I have one deer case on hand now from which some one will have trouble.

"There was less partridge snaring done in the State last fall than ever before, I think, and the express companies deserve a great deal of credit for the manly course they took in refusing to ship birds out of the State, if they knew they were snared. They issued orders to their agents not to take birds that were marked to go out of the State, and thus the amount of snaring was greatly reduced. The large number of snared birds in your market was due to the non-export law, and although the snaring was unlawful, the law preventing the shipping of birds out of the State enabled the people at home to eat and enjoy them. Partridges were very scarce in Boston markets last fall, for which the marketmen there largely blame the game commissioners of New Hampshire."

"It is but justice to say," remarks the *Mirror*, "that nothing like a systematic enforcement of the fish and game laws in New Hampshire was ever undertaken and carried out, until Mr. Hodge took hold of the matter, between three and four years ago. He is thoroughly in earnest when he starts out in pursuit of a lawbreaker, a perfect Indian on the trail of one, and unrelenting when he gets one in his grasp. He is resolute and strategic, and means business from start to finish. New Hampshire sportsmen owe much to him, and they appreciate his services."

HALCYON DAYS—IV.

LATE the following morning I decided to hunt up Chip, and started to go down to the store, where I expected to find him, but before I had taken a dozen steps there came a lively pattering of feet, and Snap bounded around the corner, gave a sniff at my legs, bounded away again, then came back, looking up into my face with a doggy laugh and a little bark, as if to say, "I'm ready for fun." I knew Chip was not far away, and going to the corner saw him coming, his fat, good-natured face beaming with pleasure. On his shoulder he carried a short, heavy smooth-bore rifle, an old family relic that had been given to him by his elder brother that morning, and he was going to take it with him on our visit to Old Shack. Chip was a proud boy that morning, and I was equally pleased, for he promised that I should share its use and we would "go shucks' in buying ammunition. There were no fixtures included in the gift, but we hunted up a couple of empty bottles and an old newspaper. I had part of a box of G. D. caps left over from the last Fourth of July, and an inventory of our cash disclosed enough to buy quarter of a pound of shot, and we went down to the store to make our purchases. We found Waxy figuring up the cost of a bill of goods that he had just sold to a customer, and with knitted eyebrows he was slowly reckoning "nine 'n' tew 's 'leven 'n' eight 's nine-teen 'n' three 's twenty-two. Tew tu carry tu three 's five 'n' five 's ten. Dollar 'n' tew cents. I'll put it tu ye at eight shillin' 'n' 'laow ye 'leven cents on the eggs 'n' fourteen on the butter." We awaited his convenience, and when he finally got through with his customer he turned to us with, "Mornin', boys; goin' huntin'?" And receiving an affirmative reply, as Chip presented his gun for inspection and explained the manner in which it came into his possession, Waxy took it, tried the lock, brought it to his face, and drawing a bead on a distant nail head, "'laowed he could fetch a squirrel in the head every time;" then handing it back, he filled our order, admonishing us as we left, "Naow be careful, boys, 'n' don't shewt yerselves."

We took the short cut up the old "dugway," which led through a large hickory woods and would finally bring us to the upper side of the wheatfield back of Old Shack's camp. We argued that we might find some squirrels in the woods and possibly a woodchuck in the wheatfield. Arriving at the edge of the woods we stopped to load, Chip claiming the right to the first shot, and as he proceeded with the operation of loading his look of earnestness and superior knowledge would have made a good study for an artist. Pouring out the powder in his hand and from his hand into the muzzle of the gun, the thickness of the barrel causing him to spill a portion of it, he tore off a large wad of newspaper, and pushing it down, began to pound it until the ramrod fairly bounded from the barrel. With every stroke the corners of his mouth would twitch and jerk in unison with the movement of his arm, and his countenance bore an expression of gravity that could not have been exceeded if he were performing the greatest feat of his life. Over the shot he put a lighter wad, merely pressing it down firmly, for he had been taught that to pound the shot would make it scatter. Then placing the cap on the nipple and pressing it down with the hammer, he gave the breech a tap to settle the powder, and looked up for the first time with an expression of satisfaction that he had done his work as well as any one could do it. There was a superstition among old hunters that to spill one's ammunition while loading was a sure sign that that load would fail to kill; and one old chap was known to actually withdraw his charge and reload with the greatest care to avoid any such catastrophe. While we were imbued with this superstition by the teachings of older heads, we did not deem it necessary to go to such extremes because Chip had spilled a part of the load; but whether from Chip's defective aim, or the hoodoo that his carelessness had put upon the charge, the sign proved good in this case at least.

Having completed the loading of the gun, we proceeded cautiously, stopping now and then to listen for signs. Occasionally a partridge would startle us with the whir of his wings as he rose from almost beneath our feet, but as neither of us thought of shooting at them on the wing they escaped unharmed. Once Snap caught sight of something and gave lively chase, but we saw nothing until he had been gone some time, when a fox came sneaking along the back track, laughing, no doubt, at the manner in which he had outwitted his pursuer, but spying us, looked a moment and scampered away again faster than he did when Snap chased him. Suddenly a crash in the branches overhead and the flash of a bushy tail as it glided rapidly along the limb toward the trunk caused us to stop and wait. I grabbed Snap to keep him quiet, and Chip brought his gun to his shoulder prepared to fire. In a few moments a little head peeped around the tree, a hoarse chir-r-r was followed by the appearance of the whole body of a gray squirrel, and Chip fired. With the report the squirrel came tearing down the tree, and fairly flew over the ground, with Snap after him, much to Chip's wonderment, for he could not believe that he had missed, and would not leave until he had searched the ground thoroughly and satisfied himself that such was the fact. Chip keenly felt his disappointment as he sadly handed the gun to me, for it was now my turn to shoot, and reloading with probably less assurance than he did, we proceeded. We saw no more squirrels, and soon reaching the fence inclosing the wheatfield, we hid ourselves behind it, poking the gun through the rails, and waited for woodchucks; but none appeared, and Chip said, "Yer won't see none till t'-night. They's all in their holes now." Crossing the field, we entered the woods back of the shanty. As I had not yet fired the gun, I was impatient to shoot, and anxiously watched every tree and bush, in the hope that something worthy of my aim would show itself. But I was disappointed, and as we approached the shanty I turned the gun over to Chip, who strutted proudly forward with an air of supreme contempt for any one who did not own a gun.

We did not find Old Shack at home, and as his skiff was absent we concluded that he was out prospecting, and as it was nearly noon would soon return. We built a fire to have it ready when he came. The fishpoles stood leaning against the shanty, worms were procured, and we commenced fishing. In the meantime Snap had disappeared, but his whereabouts were indicated by his short yelps as he followed some trail. After we had been fishing a while we were startled by a series of short, sharp barks and growls, then a yell of agony and more growling and snarling. It was evident that Snap had found an enemy. Chip dropped his pole and ran for the scene; I followed, but turned back to get the gun. When we reached Snap we found he had attacked a hedgehog, and with every grab he made at it his mouth and lips would become filled with quills. The pain made him desperate, and he continued to bite and snap at the bristling little ball until Chip, realizing that he was getting the worst of it, rushed in and pulled him away. Then resting the gun over a stump, I took deliberate aim and killed the animal. Snap, seeing his adversary stretched out, broke away and savagely attacked the dead animal again, only to receive more wounds, and finally gave it up, rolling over and over, biting the ground and pawing at his jaws. Poor Snap was in a sorry plight. It was his first experience with that kind of game, and it was many a day before he got rid of all his troublesome tormentors.

Returning to the shanty, we found Old Shack had arrived, and as we related the story of the fight, while Chip's eyes were half filled with tears in sympathy for his friend, the old man assured him that there was no danger and that the quills could be nearly all extracted, and after dinner he would help him do it.

Throwing a fresh supply of wood on the fire and picking up the fish that we had caught, Old Shack took from his pocket a large jack-knife and cleaned them; then getting some pork and his frying-pan and coffee-pot, he set the coffee over some live coals that he raked out and fried the fish and pork together. This, with some pieces of hard bread without any butter, constituted our meal. Simple as it was, it was relished far more than a greater and better variety would have been at home. After finishing it, Old Shack and Chip, with the aid of a pair of pincers that was found among the old man's effects, set to work extracting the quills from Snap's mouth. At first the dog objected and vigorously resisted Chip's efforts to hold him, but after a few quills had been pulled out and he found that the painful operation was for his own good, he lay quiet, only wincing occasionally as one pulled harder than usual.

"Puts me in mind of a pup I hed once when I was a young feller," said Old Shack. "I used tu hunt a good bit them days, 'n' hed that pup purty well trained, 'n' there wa'n't a better coon dog in them parts. I was purty pert 'n' run 'round 'mong th' gals consider'ble. One night I'd made it up 'ith some fellers t' go coonin', 'n' was gettin' ready 'n' th' pup was watchin' 'n' waitin', fer 'e know'd what was up 's well 's enybody. 'Bout 'n hour 'r so 'fore 't was time t' start, some fellers drove up 'n' sed they was goin' t' hev a big dance 't Si Dowberry's, over 'n Jones's Holler, 'n' thet broke up th' coonin' party, fer we c'ncluded we c'ld hev more fun 't Si's 'n we c'ld coonin'. Wal, when th' pup seen me dressed up in my party close he know'd his fun was spiled, 'n' 'e stuck 'is tail 'tween 'is legs 'n' walked off, 'n' I didn't see nothin' more 'f 'im 'til 'ong 'bout midnight, after we'd quit dancin' tu hev supper. We was all gettin' ready t' set down when the tarnal dog come sneakin' in with 'is tail 'tween 'is legs 'n' 'is back humped up 'n' 'is head hangin' down, 'n' laid down right under the table, stinkin' so 't everybody run fer th' door 'n' winders t' git out. He'd bin huntin' on 'is own hook 'n' tackled a skunk, 'n' when 'e got purty well soaked 'e cum tu me fer sympathy, I s'pose, but I tho't then 't was jist cut o' spite 'cause I'd disapinted 'im. It broke up the dance 'n' the supper tu, 'n' I heerd they didn't get the stink out o' the room fer more 'n a month." And the old man chuckled long and deeply as the remembrance of the occasion returned to him. "The pup let skunks alone after thet, 'n' I guess Snap won't tackle eny more porkypines agin, fer a while."

It was a long and tedious task, but after much patient work by Old Shack and Chip and endurance by Snap, the largest of the barbs were removed, and Old Shack said the others would not bother him much, "fer he'll git used tu 'em after a while 'n' they'll work out themselves."

During the surgical operation that had been going on Chip plied the old man with many questions regarding his mode of life and intimated that he would like to stay and camp with him, but received little encouragement. He seemed determined, however, to stay if permitted, and persisted so earnestly that Old Shack was compelled to either refuse or consent; and after many objections, in which the hardships of a winter's camp life were fully depicted, and the intimation that his "folks 'ld object," all of which was met by the argument, "I don't care; I c'n stand it if yer kin, an' the folks don't care enyway," it was decided that Chip could stay on condition that he would first obtain consent from "the folks" and be willing to share the discomforts of Old Shack's limited quarters. After arriving at this decision Chip was impatient to go

home, and said he would come back that night. "Wal, I'll du the best I kin fer ye," Old Shack said, and we started at once, but not until I had received a cordial invitation to "cum agin, 'n' mebbe we'll hev a better dinner fer ye next time."

As we passed the place where Snap had made his unfortunate mistake his back rose and he shied away with a low growl and gave the dead animal a wide berth. We did not stop to shoot woodchucks nor lose any time on the way, for Chip was so anxious to return to the shanty that he had no more taste for hunting that day.

In the evening, when I took my place on the bench in the store, Chip was absent, an occurrence so unusual that Waxy, after repeated glances in the direction of his accustomed place, came over and casually inquired, "What luck?" and when I explained the cause of Chip's absence he exclaimed in tones so loud that everybody heard him, "Wal, I declare!" Other boys were there, and one big, overgrown chap came and took Chip's place beside me, but his presence seemed like an intrusion. The place was void of any attraction for me, and when I found an opportunity to slip out unobserved, I went home discontented, but resolving that my leisure time should be passed at the shanty as much as possible. J. H. B.

MANSFIELD VALLEY, Pa.

UNEXPECTED GAME.

NOT "my kingdom for a horse," but a guinea for my Winchester. So thought I one bright November day in the season that has just closed, as a beautiful buck stood 200yds. from me in an open field while I held in my hand my little 12-bore Parker, loaded with bird shot. It was in this wise. I came cautiously through a piece of woods where a few days before I had seen a number of grouse, and stood just outside in the tall weeds that covered a field that ran up into a corner of the timber; my dogs were working in the low pine at my left; I saw in front of me, just over the brow of the hill what I thought was the motion of some dead mullen stalks. I thought it strange, but it was soon explained when I saw that the antlers of a deer were what I had taken for the weeds moved by the wind. He took a few steps toward me, and I knew from my repeated experience with the game, that my only chance of knocking him down with my light charge was not to make a motion and let him run on to me. Unfortunately the wind was blowing from me to him, and as he leisurely moved toward me he caught a scent of the tainted air, turned and in an easy lope was soon out of sight over the brow of the hill. I then dared to stir and quickly threw out the cartridges and replaced them with buckshot, and crawled carefully forward only to see the deer slowly running across the field 500yds. away. I followed his track across the plowed fields and through the meadows until it was too dark to see, then left it where it led toward a piece of woods in which I thought I might find him in the morning. I sent word back for my team and was soon telling them at home of my experience. My rifle was taken from its case and everything made ready for an early start. During the night a hard storm came up, and Thanksgiving Day was ushered in with sleet and a driving rain, too hard to face. The next day a message came to my office "They killed your deer." An old deer hunter had noticed his track in the snow and soon had him "hung up." I was sorry to lose him, but it was a treat to see this beautiful animal; it brought to mind the camps away out in the wilderness on Pine Creek, where winter after winter I used to carry my rifle, and we often had a goodly number to "bring out." But those days are passed and gone, and those camping places are all deserted, while the burnt stumps left by the lumbermen are the grave stones that sadly tell of what once was—but now is gone forever.

I have found but few quail here this season and was disappointed too in my trip South; having reached my shooting ground one night, only to find in the morning that a foot of frozen snow had covered the ground while I lay dreaming of the partridges.

What pleasant anticipations often go hand in hand with these disappointments. I oil up my guns and put them away, while I bring out my fly-book and write down the names of the flies that I must have tied, for the water in the frozen streams will ripple by and by in the warm May day, and the "winter of our discontent" will be ended. Then I look over a score of photographs of the Mastigouche Lakes and its rushing river; in the noise of the winter wind I hear the roar of the falls, and as it lulls I can hear the breeze as it comes through the birches high up on the mountain side. So I wait. SPICEWOOD.

CENTRALIA, Pa., January.

COOTS.—Nantucket, Mass.—I notice in your issue of Jan. 13 an article on shooting coots this season. I supposed we had a Massachusetts law which prohibits shooting from boats, and as far as I know, that law has been respected around here. I have not seen or heard of a gun being fired from a boat. We consider the coot here a very poor bird to eat. Perhaps "Cooter" will publish his way of cooking, then we will not always have to give them to the hogs, or leave them where we shoot them. Thanks to the boat law, sheldrakes and whistlers are quite plentiful in our harbor. They tend around our shores and wharves; local sportsmen get very good bags, one shooting fifteen from the wharf in a very short time. Since returning from the West I have not had the courage to go out after game. It seems almost like looking for a needle in a haystack, still sportsmen around here think shooting very good, probably I should if I had not been out in Dakota. Should there be a good freeze-up the air hole shooting will be fine. In Dakota last November, one day about noon I was behind a rat house which served for a blind, when I heard the "honk" of geese. I turned and there were seven of them; I shot one with each barrel. I had in at the time No. 6 shot. The first one I winged, the other I killed; his weight was 12lbs. 15oz., so I call it a 13lb. goose.—W. N. F. [The law referred to does not apply to the waters about Manomet Point, to which "Cooter's" article referred.]

KENT COUNTY CLUB.—At the annual meeting of the Kent County Sportsmen's Club, of Grand Rapids, Mich., held Jan. 14, the following officers were elected for the ensuing year: President, E. S. Holmes; Vice-President, L. D. Follett; Secretary, A. B. Richmond; Treasurer, N. Fred Avery; Directors—One year, A. C. Horton; two years, T. Stewart White; three years, C. D. Spaulding; four years, W. C. Dennison; five years, H. Widdicomb.

A FIELD NOTEBOOK.

JANUARY 1, 1887.—Another shooting season passed; another column of successful shots and inglorious misses to foot up, another page of sweet memories and laughable incidents to refer to in memory's ledger. Twenty-one pages are written in this book, representing the shooting seasons which it has been my lot to enjoy with dog and gun.

As I look back over the first of these I see the old muzzleloader and the little barking cur, remembering all there was of a day afield might be summed up in the potting of a grouse or two, and mayhap a squirrel. Further on came a disposition for reading the literature of field sports, new ideas, broader views, a growing love for nature and her works, happy days when no game was found, or, when discovered, too wary for the tyro and perforce left for the use of more skillful followers. Then I note the time when my purse gave answer to the call made long before for a breechloader. How the ghosts of those old days arise! Should it be top snap or side, bar or back action locks, twist, laminated, or damascus barrels, foreign or domestic manufacture? Gun circulars innumerable littered my desk and table, filled my pockets and my mind. Friends were appealed to who kindly gave advice and experience, until finally the choice was made, the order given. Shall I ever forget when it came? Ten-gauge, 10lbs., fine damascus, well engraved, curled walnut stock, pistol grip; a thing of beauty; to me the harbinger of many happy and joyous days to come. What a thrill of pleasure as I brought it to my shoulder and caressed its polished surface with my cheek! Now the time of anxious waiting for a day when I could try its powers. This soon came, and for a time contentment was a sojourner in the household. Then from too constant perusal of the canine department of our favorite paper I became convinced that in order to round out the measure of my happiness I must possess a dog. Let me hint to the younger members of the fraternity to get their wives' consent before ever investing in this article; it will be to their comfort and quiet, and still more so to the comfort of the dog. My wife was not at first in favor of a canine addition to the family. Many a quiet argument was indulged in, until at last there came to our home a mild-eyed, quiet, loving little pointer gyp, which my lady immediately adopted for a pet, naming her Brownie from her silken seal brown coat. She proved a beautiful companion and faithful friend, at home or in field, without a fault. Her training was a pleasure, her intelligence a constant source of surprise. Although at the time I did not know of Mr. Hammond's book or his methods, his words of advice were more than true applied to her.

I now turn a page filled with sorrow and regret, possibly wet with tears. While ranging over the brow of a hill one day, Brownie flushed a bird which came directly toward me and I killed it. When she came in sight at my command, she brought the bird and laid it at my feet, but the order to "hie on" was for the first time in her life unheeded; instead, she came nearer, raising her head pitifully to me. I saw one eye closed, and separating the lids with my fingers, discovered that a stray shot had put out one of her beautiful eyes forever. My hunt for the day was ended. I took her in my arms to the carriage which was waiting for me. Brownie sleeps in her grave. Further on, the pages show her son Buff on the scene of action; a noble dog, companion of many a glorious day in field and wood, one of the few which are called good partridge dogs. He knows all the tricks and ways of an old cock grouse, and is all that could be asked for woodcock. He acknowledges but one master and yet is not jealous of other dogs in the field.

I have been told, and I think it is so held by many, that the pointer is not so courageous as the setter in bad cover. However, I have yet to see the setter that will venture where Buff refuses to go. Another saying is that letting a dog retrieve makes him unsteady. Where this is true, the fault is either that the dog is not of good parentage, or else was badly broken, possibly both. A dog which is made a companion, doing his work in love and not in fear, rarely lapses from his early training, for when he does a good deed he expects, and should have, his reward, which may be only a word of praise, but is yet as dear to him as to us who like to have our good deeds appreciated. Although these ideas are not new, and practically the same thing has been told over and over in the FOREST AND STREAM, it seems as though the demon of unmanliness were turned loose in some men as soon as they get behind a dog for a day's sport. They are cool and pleasant at home, in business relations and in other pleasures, but at the least mishap on their own part, or that of their luckless brute friend, and lo! a wonderful change. I have been witness to such exhibitions as made my blood boil with indignation, and I have blushed for manhood so debased.

In this vicinity our main dependence for sport is partridge shooting, and during the twenty-one years of my residence here there has been a gradual falling off in the number of broods raised each year. Of course, some years were better than others, but surely and notably the birds are growing less. The past season showed more broods than for three or four years previous, which I attribute in part to the favorable weather during nesting season. From careful observation I conclude that the fox is their greatest enemy. Where the little gray rabbits are plenty there reynard and his family are most numerous. Rabbits were getting very numerous about the years 1882-4 and the foxes were very troublesome. I saw many places during that season where they had caught and devoured birds. At last, about every boy in this section procured a ferret or an interest in one, when, the law notwithstanding, poor bunny, like the Chinaman, had to go; the war of extermination continued, and the season of 1885-6 saw nearly the last of them. As the rabbits disappeared the foxes became less numerous, and although few were killed, scarcely a track was to be seen in locations where a year or two previous they could have been counted by the dozen.

This may account in part for the good shooting of the past season.

Last and worst of all is the clearing and draining of swamps, brush patches and timber where the birds formerly found abundant cover. The insatiable desire for the present "mighty dollar" leads men to cut, burn and clear. Could they only see into futurity they would cherish and save, leaving to posterity something of value instead of barren hillsides, dried up springs and brooks, with only the remedy of planting new forests. The articles on forestry, published in these columns, should be sown broadcast throughout the land, and made to be read in public like the Declaration of Independence. BAR LOCK.

CORTLAND COUNTY, New York.

COL. CROCKETT IS LOADED FOR BEAR.—Little Rock, Ark., Jan. 20.—*Editor Forest and Stream:* The shooting for the season has not been good. Quail were badly hurt by a storm in June and owing to the absence of mast the ducks went by. Deer have been reasonably plenty and many have been killed. The Legislature is in session and no prophet nor son of a prophet can tell what is to become of our game law. At least twenty bills have been introduced, ranging all the way from a repeal to a more stringent law. In the Senate a bill has been reported favorably prohibiting the export of game and fish. This will probably pass, as we are cursed with pot-hunters for the St. Louis market. In the House the chances are that the act of 1885 will be repealed. We hope to stop it in the Senate, where Col. R. H. Crockett, a grandson of the celebrated David Crockett, is loaded for bear on the subject. If it can be stopped he will do it. All our sportsmen and our clubs are working against the repeal, but we have an up-hill task.—CASUAL.

WHAT FOLLY!—Forreston, Ill., Jan. 22.—*Editor Forest and Stream:* I this day received a circular addressed to any prominent duck shooter, from the Monmouth Shooting and Fishing Club, opposing the passage of a bill to prevent the spring shooting of water fowl, also a petition to the Legislature to the same effect, which they wished circulated. But as I am in favor of the bill I decline to aid them, and I am getting numerous signers to a petition in favor of the passage of the bill. I think it would be well for the friends of the bill to unite in getting up petitions in its favor, as I suppose the Monmouth Club has sent one of its petitions to every postoffice in the State.—C. C. P.

NO WHEAT IN ALASKA.—*Editor Forest and Stream:* In the complimentary notice of "Our New Alaska" which you are pleased to copy from the "Magazine of American History," there is one serious misstatement (not yours) which may some day be charged against me, to wit, that the "wheat region of Alaska alone might feed the world." I cannot find a syllable in the text that can be construed into such an assertion, nor do I find the word "wheat" used in connection with Alaskan products.—CHARLES HALLOCK, Author, etc.

JAMAICA PLAINS GUN CLUB.—At the annual meeting of the Jamaica Plains Gun Club, held Jan. 10, the following officers were elected for the ensuing year: S. D. Charles, President; A. W. Tice, Treasurer; A. B. Bradstreet, Captain; C. H. Cilley, Secretary; Executive Committee—Sam'l Bradstreet, A. W. Tice and A. T. Amsden.

NEW YORK, Jan. 22.—Ruffed grouse and quail are displayed for sale in most of the up-town markets of New York. A game protector walking the length of Third avenue could average about one seizure for every two blocks.—MARK WEST. [Quail may be sold until Feb. 1.]

THE CONSOLATION THERE IS IN IT.—What a comfort the dear old FOREST AND STREAM has been to me through all these days of sickness. It has been the one paper that I was able or cared to read, and the one which I did read. —*Correspondence (Cedarville, O.).*

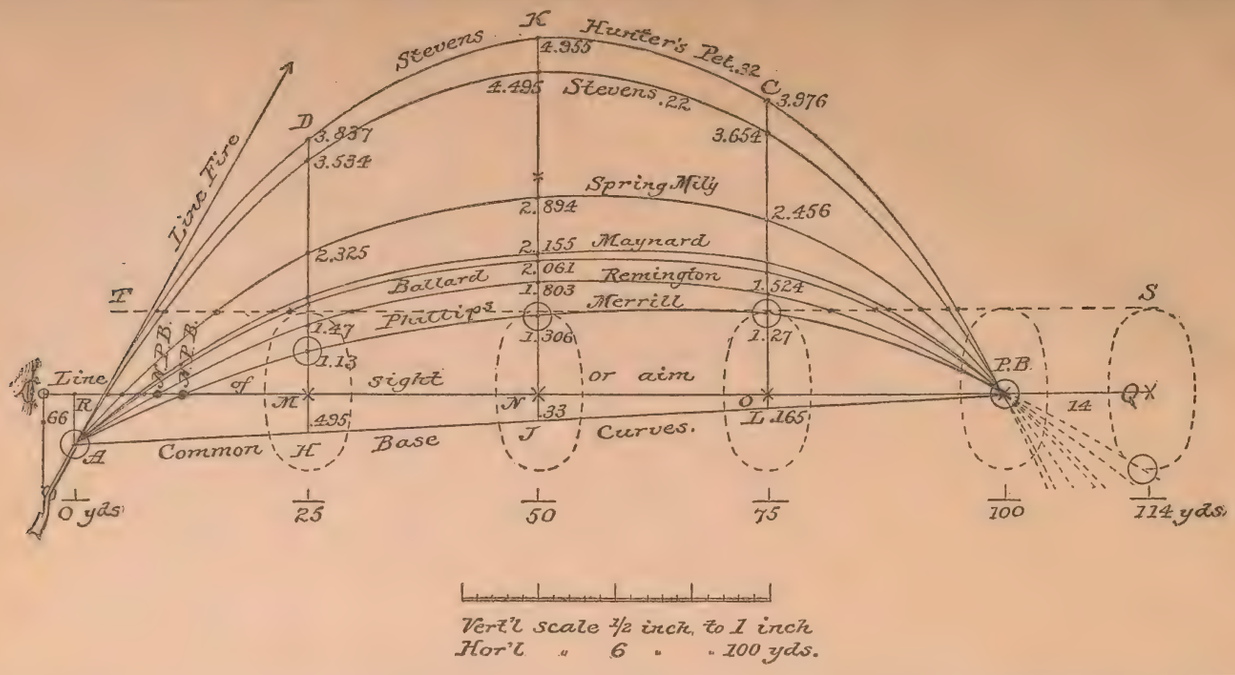
PENNSYLVANIA.—Little Marsh, Jan. 18.—Grouse are wintering well in this section, and as we have had no ice storms yet, and there is a good supply of birds, we may hope for good shooting next season.—TIOGA.

BROWN'S combined de-capper, re-capper, wad seater and crimper is highly recommended to sportsmen as a most useful tool to take on a hunting trip.—*Adv.*

QUAIL IN MAINE.—Portland, Jan. 20.—We are wintering Virginia quail (*Ortyx virginianus*) in barns, and outside also. A repeated experiment.—E. S.

QUAIL IN CONFINEMENT.—Mr. G. A. Tilford, of Ridgewood, N. J., has in captivity a number of quail which he proposes to free in the neighborhood.

AN ANALYSIS OF THE TRAJECTORY TEST.



Editor Forest and Stream:

It has been my desire not to have anything in particular to say in reference to your most valuable test of hunting rifles made in September and October, 1885, at Creedmoor. But you may recollect that through your columns I early indorsed your report of this trial, as did many others, so that it now stands embodied in your pamphlet as an authoritative record of this trial, to the full extent of the rest. This report, among a great many other things, gives the heights of all the trajectories made by the respective rifles. To obtain these was the main object of the trial, and its end was to spread these before the public so that all might see them, and at a glance almost learn the true lessons they teach. The most prominent of all these is:

That rifles which make flat trajectories, shoot with greater accuracy along a range than rifles which make high trajectories, both rifles being here regarded as normally shooting steady.

As one whose muzzleloader was in this test, and who had for some years previous to this trial written much about the hunting rifle, especially in favor of the muzzleloader for its superior accuracy and power, but whose teachings were unheeded by some and ridiculed by others, I, who had and yet have a reputation to sustain in these matters, I, who stand fully sustained in all I have ever written by your report, will not now suffer that report to be perverted in its meaning nor my rifle to be misrepresented as in the letter here quoted in full, lest I be accused of garbling it.

Of itself it is hardly worth noticing, but remaining unanswered and being backed up by several others, and not denied by the several makers of the breechloaders, whose rifles it is unqualifiedly asserted beat my muzzleloader, and as this letter has been on record in your columns for now near six months and will soon crystallize into a fact, I here produce it. Napoleon Merrill had stated facts, and Mr. Burns, as a critic, steps in and denies them. He writes, "I wish to call the attention of Napoleon Merrill to the fact, that in your test of hunting rifles there was not a muzzleloading hunting rifle in the contest, the nearest to it being the one [the Merrill rifle] fired at the 100yds. range, and that one was beaten in regularity of bullet flight, *i. e.*, in accuracy, by 27 of the 33 breechloaders [only 31 were in competition] in competition. At 200yds. the muzzleloader [G. J. Romer's] target rifle, with all the appliances of a target rifle, beat all of the breechloading hunting rifles in the regularity of shooting [*i. e.*, in accuracy], the nearest one to it being the Maynard special, which was just four-thousandths of an inch behind the Romer muzzleloader [what a "tight fit"], the difference in elevation at 100yds. of the five shots:

Romer, .32; Maynard, .296; difference, .004 of an inch. The work of the breechloader is telling it.—R. H. BURNS."

First—It is not true that my rifle was not a hunting rifle, nor is it true as to Romer's. Heavier rifles than either are much used in hunting, especially in the East. The weight of my rifle, 11lbs. 6½oz. is just that of the one which I carried on our frontiers while in the Second Regiment of U. S. Dragoons, from 1843 to 1856, less three years out for the Mexican War, and which I ordered to be made for my frontier service, and I never thought it heavy, but a tenderfoot no doubt would.

Second—"All the appliances" Mr. Burns refers to as belonging to the Romer rifle (or to any other rifle at the test) had nothing to do in making a high or flat curve. He as a critic, and all his very knowing followers, should know this, and not have tried to humbug your readers with such insinuating stuff. Beware of such writers.

Third—What he says about the Romer rifle being so nearly beaten by the Maynard, is not true, but far from it. The Maynard was beaten—yes, more than "distanced" by the Romer rifle—this we intend to prove in our next article.

Fourth—As to his statement about the Merrill rifle being so badly beaten, there is not one word of truth in this, and we will proceed to prove it, and "show up" matters pretty generally. Your report must be sustained. We purpose to treat this matter in such a way that every rifle tested shall have its true place on the list of merit, for a flat curve or strong and good shooting. Such a record will be valuable as a reference.

SOME NECESSARY DEFINITIONS.—To have rifle shooting more easily comprehended some definitions are actually necessary, and I will give the following and hope they may be used:

The right-angled triangle, A R P, I denominate the triangle of the *negatives*. It height in this case is .66 of an inch and its apex is at the point blank.

The *negatives* are the vertical distances cut off from the heights of the trajectory by the "line of sight," and lying between it and the base of the curve. See for negatives lt A, M H, M J and O L, and A P for base of the curve. The negatives all take the — (minus) sign.

The *muzzle negative* is the vertical distance, A R, between the axis of bore and the "line of sight" or aim. See diagram. Its value can always be obtained by measurement, and for the same rifle it is a constant quantity. By knowing the muzzle negative the other negatives are easily obtained, thus negative at 25yds. is three-fourths of .66=.495 at 50yds., one-half of .66=.33 at 75yds., one-fourth of .66=.165.

The *base*, A P, of the trajectory is a right line connecting its two ends. See diagram. The trajectory begins at the axis of bore, and is regarded as terminating in target practice where the bullet strikes the target.

Near point blank is the first intersection of the line of sight or aim with the trajectory. See N H P in the diagram. We have once before given this definition in your columns, Sept. 17, 1885, while treating of the round ball for accuracy at 100yds.

The *error* of the rifle at any point of the range is the vertical distance of the trajectory or center of the bullet hole from the line of sight. It is measured from the line of sight. Now see the diagram and the definition stands explained. At N B P fine near point blank, and again at P B, the point blank proper, there is no theoretical or practical error under the definition, because the same shot (and under the same aim) makes a center at these two points, while at all other points in the range there is an error, either above or below, however great or minutely small it may be. Thus error for measurement refers to the line of sight and the curve or bullet's center. Of two rifles that which makes the least error is the most accurate, hence error and accuracy may be regarded in use as reciprocal terms, the former being the most proper. The above definition has been given once before.

Point blank is the second intersection of the line of sight or aim with the trajectory. See P B for this.

Trajectory "accuracy," or more properly *error*, for any point in the range (and beyond it) is the vertical distance from the line of sight or aim to the trajectory. Between the two point blanks the error is above the line of sight and is + (plus); from the muzzle to the near point blank it lies below the line of sight and is — (minus); beyond the point blank proper it is below the line of sight and is minus. Trajectory accuracy results from the superior power of the rifle.

With the definitions we can proceed understandingly in our coming demonstrations, and we think your readers will appreciate them. This will be our reward.

We will next introduce our original diagram. Our intention was to introduce only the lowest Rem.-Hep. .38-cal. trajectory and the highest Stevens Hunter's Pet .32-cal. trajectory, with the Merrill muzzleloader trajectory, and from these three to make our demonstration; but as the claims of the Maynard and Ballard have been specially mentioned by Mr. Burns and others as beating the muzzleloaders one or both, I have introduced their curve also. The Spring field Military is introduced only because it is a pretty well known trajectory and will serve as a kind of key or measure to all of the 33 trajectories made at the test.

1. The point blank range is 100yds., but the diagram is made to show the shooting for 114yds. The Merrill rifle, only, hits the target at 114yds., all the others shoot under it.

2. The Merrill muzzleloader beat all the 31 American breechloaders. Proof, it made the flattest trajectory, therefore it lies the nearest to the line of sight (or aim) from which accuracy is measured. The Bland rifle comes next in flatness of trajectory, and next comes the Rem.-Hep. .32-cal. So nearly does the Bland curve agree with the Merrill that it could not be plotted in the diagram.

3. The line of sight or aim R M N O P Q is one of the most important lines in the diagram, because from it the measurements for error (or accuracy) must be made—to be correct, ring measurements refer to this line. It is legitimately made common in the diagram for all the rifles, because it places each rifle on a theoretic par with the others. Practically a common base favors a little such of the breechloaders as have thinner barrels and lower sights than the muzzleloaders, but the muzzleloaders can stand this and yet have a broad margin in their favor.

4. The five dotted-line bullseyes are 2in. in diameter, and their centers M N O P Q are in the same line of aim, which is common to all the rifles, i. e., one aim answers for all the bullseyes and the error results are the same as if they were separately put up, not aligned and shot at.

5. All the 33 trajectories are regarded as placed upon a common base A P. This is fair and legitimate in every respect. The table heights of the series of 5 shots each for each rifle, all refer to a common base. The trajectories are but huddled in the table upon a common base, being removed from their separate bases on the screens and targets.

6. The height of the trajectory is measured from its base A P. See heights H D, J K and L C. The same is true for every point in the range from A to P. The height of any points in the trajectories, say at 50 and 60yds., may be obtained by simply applying the compass to them and the given vertical scale; trajectory heights take the + (plus) sign.

7. A flat curve is one which has little curvature, and it lies near the line of aim. Example, see the Merrill curve. It can only be made with a high velocity of the bullet. And this demands a high proportion of powder to lead. Rifles making flat curves are good shooters provided the bullets follow nearly in the same path; flat and steady shooting must combine in any rifle to make it the best.

8. A high curve is one which has relatively greater curvature than a flat one, and it lies relatively more remote from the line of aim. Examples, see all the breechloader curves in the diagram, especially the highest one, the famous "Hunter's Pet" Stevens .32-cal. A high curve results from a slow velocity of the bullet. Rifles making high curves are poor shooters along the range and beyond it, even though they shoot steady and make a good target at the end of the range. They shoot over along mid-range and rapidly too low beyond the range. Whether the makers of breechloaders can put powder enough into their ammunition to make flat curves and steady shooting remains for them to say and prove. From their thirty years or more of trial and experience, I would say they cannot. If they can, why were they so badly beaten in this test? This is the great question the public wish answered. Can they make very close and uniformly good shooting rifles?

9. A rifle which does not make a very flat curve and shoot steady for 100yds. does not make a good hunting rifle for small and large game.

10. No rifle yet invented will shoot very close for over 110yds., hence rifles are generally sighted 100yds. point blank. Muzzleloaders sighted for 100yds. and breechloaders for 80 or 85yds. give about the same errors at mid-ranges.

11. The same aim and shot which centers at the near point blank will again center at the point blank far away; all of these things are considered theoretically, practice will not quite sustain them in all respects, because the conditions may vary.

12. The Merrill rifle is the only one that hits a squirrel's head all the way from the muzzle up to 114yds. This rifle or such a rifle will bring down the game, encourage the hunter and feed the camp. To have it is a boon and blessing indeed, and so the early settlers of this country regarded it for over a century; it hits, as you see, within the 2in. circle, with the aim on the center; proof, see the diagram.

13. All the other rifles miss a squirrel's head and the circle except for the first few yards and the last few yards near the point blank. The dotted line T S, drawn but 1in. above the line of sight or aim, shows to the eye at a glance how soon all the breechloaders shoot over after the bullet leaves the rifle, and also for what a long distance in the range they continue to shoot over and miss all the small game. These rifles, as you see, shoot over at mid range all the way from missing a squirrel's head up to missing a goose, dog or a 9.0in. bullseye at 50yds.; for proof of all this and much more, see the diagram. Such weak shooting rifles will discourage the hunter, especially the beginner, because he cannot get the small game he shoots at. Hence it is no doubt that shotguns have largely taken the place of rifles within the past 15 years, for 40 and 50 years ago rifles were almost invariably used.

14. The heights of the trajectories all appear unnaturally great. This arises from the distortion incident to the great disparity between the horizontal and vertical scales. But the figures are held to be exactly correct and the curves are very carefully plotted. We make the diagram distorted, because we wish to have it very sensitive, so as to expose errors, if there be any of importance. You will see that an error of 1-10in. in any of the trajectories would show by a crook or unnatural bend in it.

15. The distances A R, M R, N J and O L are the negatives. As before stated they are negative errors, and take the — (minus) sign. Between the 2 points blank they must be subtracted from the heights of curve to get the error. This will hereafter all appear more plainly.

16. The curves, plotting so well, furnish good proof of the correctness of your test. The curves at the English test through screens, under the supervision of the editor of the London *Field*, in the fall of 1883, did not plot so well as yours by any means. In plotting the Holland and Bland curve (same rifle you tested) as we did on the same base for 150yds., they were alike wavy, unnatural and out of place at one point in the range by about ¾in. I think, however, your test, on account of variable winds, was not perfect, but could be bettered a little perhaps. Its merits will bear scrutiny.

17. And now, if the beginner with the rifle, as well as others, cannot understand my diagram demonstration and other explanations, then I must yield and be disappointed. I must say I have tried hard and at the expense of considerable repetition to be understood by all. My task is nearly done, and all *probono publico*.

THE MERRILL AND REMINGTON-HEPBURN .32-CAL. RIFLES COMPARED FOR TRAJECTORY ACCURACY AND POWER.

Merrill Rifle.—The Merrill muzzleloader, .42-cal., first in merit of all, was the only muzzleloader tested in the trial at 100yds. range. It was made by Phillips. The mean height of its trajectory, as reported at 50yds. midrange for 5 consecutive shots is 1.306in. This is the flattest and strongest trajectory made at this range, where 32 breechloaders were tested and one American breechloader "failed to act." But one other muzzleloader was present; this was the Romer rifle, which was tested at 200yds. only.

Rem.-Hep. Rifle.—The Remington-Hepburn breechloader, .32-cal., made the flattest and strongest trajectory of any of the American breechloaders and it stands third on the list of merit, as will hereafter appear. The Bland, English double express breechloader .45-cal., stands second on the list of merit; this will hereafter appear. The mean height of the Rem.-Hep. trajectory at 50yds. for 5 consecutive shots is 1.803in.

We therefore have the ratio of heights as 1.803R. to 1.306M. To find the best in flatness in the Merrill over the Rem. in per cent. we have 1.803 divided by 1.306, equals 1.38; hence ratio of 1 to 1.38 equals .38. Thus the Merrill rifle beat the Rem. in the flatness of its trajectory .38 per cent.; and now remember that this is the strongest shooting rifle (in velocity of bullet) of all the 31 American breechloaders.

But the heights of the curves at 50yds. do not declare the trajectory errors or accuracies of the rifles at this point, as well as of other points in the range.

From the respective heights of these 2 mean curves at 50yds. (omitting the other 3 screen points in the range) must be subtracted (in this case) .33 of an inch (see my diagram) which under my new and much needed definition is called the "negative" at this point. The error you see all lies above the line of sight at 50yds., and has a + sign, hence .33 must be subtracted.

To get the errors at 50yds.

Merrill height of traj.=1.306in.	Rem.-Hep. height=1.803in.
Negative=0.33in.	Negative=0.33in.
Error=.676	Error=1.473

Now these errors, .976 and 1.473, are but the distances these rifles shoot over the center N of the 2in. bullseye where the aim is. In other words they are the vertical string measurements to determine the accuracy (more properly the errors) of these rifles. The shooting is regarded as normal. For the muzzle beat in less error, called accuracy: We have the Rem. error=1.473in.; Merrill error=.976; thus Merrill beat in less error or accuracy .5C of an inch. To find the per cent. of beat in trajectory accuracy we have: Ratio of errors as 1.473 to .976; and 1.473 divided by .976 equals 1.50+; hence the ratio is 1. to 1.50. Thus the Merrill rifle beat in trajectory accuracy .50 of an inch at 50yds., and also 38 per cent. in the flatness of its curve and in bullet velocity, and velocity power; the weights of the bullets are not here regarded.

Note well that this .50 of an inch beat in accuracy and this 38 per cent. gain in power is solely due to the two types of rifles and their ammunition; and that these great merits have no connection here (or in this trial) with what we commonly call target "accuracy"—"accuracy," or the close bunching of the bullets on the target; and that to the above given accuracy for the muzzleloader must be added, to swell the amount, the further merit of target accuracy, provided that on a further trial for this purpose, the rifle is entitled to it. These remarks have a general application to all rifles and rifle shooting, and I do not believe these very important points have ever been demonstrated or published in this country, at least I have no knowledge of it.

We have shown above that the muzzleloader beat the breechloader by considering only the mean curve of each rifle for five shots; these curves we took from your report. But an effort has been made by Messrs. Burns, Clapp, "C. L. S.," of Texas; Leopold and Remus, and is still being persisted in, which goes directly to destroy the vital force of your invaluable report. They do not deny that the trajectory made with my rifle is flatter than any other made at the 100yds. range trial. No, the records show too plainly for this. Nor do they accuse my rifle of not shooting steady. No, for your report specially says it did. I will extract for this rifle: "The powder charge weighed 98.5grs., while two bullets weighed up respectively to 212.7 and 213.1grs. * * * The wind at the time came from the 5 o'clock quarter at the rate of 18 miles per hour. With such a charge from such a weapon the shooting was of course very accurate and a very flat line of fire (or trajectory) is shown" (pamphlet report p. 60). Again the report says, p. 8, the Merrill and Romer rifles "each maintained a high degree of accuracy." Of course they did, and yet the effort is to try and flood the public mind with the idea that the Merrill rifle was beaten in accuracy, as Mr. Burns declares, "by 27 of the 33 breechloaders in competition, and that the Romer muzzleloader came within .004in. of being beaten by the Maynard rifle." Such is the spurious doctrine these critics are trying to have believed. It repudiates and belies the true lesson of your report and of the trajectories.

Such heresies in behalf of the great interests of rifle shooting must be put down now and forever.

Perhaps these writers believe that because target and screen accuracy were disregarded in the test that therefore no one can set up accuracy in proof against them, hence if they boldly assert that my muzzleloader was beaten in accuracy and stick to it that they will be believed in the end.

If they so believe they labor under a sad mistake, as they must learn, and I hope this will lead to good results, one of which would be that they write no more about the rifle.

We will now proceed to ascertain how much the Merrill rifle beat the Remington-Hepburn .32-cal. in vertical error or trajectory accuracy in each of the 5 shots at 25yds., 50yds., and 75 yds. To make the work complete we will begin with the 5 shots on the first screen at 25yds. We select the breechloader because it made the flattest trajectory of any of the American breechloaders. If the Merrill rifle beats this it beats them all:

Remington-Hepburn rifle, 25yds.

	1	2	3	4	5	
Ht. traj's...	+1.513	+1.477	+1.443	+1.429	+1.478	above base at 25yds.
Negatives..	—.495	—.495	—.495	—.495	—.495	below line of sight.
Errors.....	+1.018	+.982	+.948	+.934	+.983	st'g 4.865 above l. sight.

Such are the vertical errors of each shot, and such is the string. The shots all strike over the line of sight, or center of aim at M on the 25yds. 2in. bullseye. Now see the diagram and you will understand this work. The string is commonly called one of "accuracy," but "error" is more proper. Next comes the

Merrill rifle, 25yds.

	1	2	3	4	5	
Ht. traj's...	+1.183	+1.230	+1.035	+1.170	+1.031	above base at 25yds.
Negatives..	—.495	—.495	—.495	—.495	—.495	below line of sight.
	+.685	+.741	+.588	+.675	+.536	st'g 3.178 above l. sight.

Such are the vertical errors above the line of sight for each shot and such is the string. The bullets all strike above the line of sight or center of aim at M of the 2in. bullseye. The measurements for vertical error are made from the line of sight. This may be termed trajectory accuracy as against target accuracy.

Explanations. The Merrill rifle had on peep and globe sights, but sights of any kind on the rifles had nothing to do in making a high or low curve. It weighed 11lbs. 6½oz., this again had nothing to do in the height of its curve; nor had the weight 7lb. 11½oz. of the Rem.-Hep. .32 anything to do with it. Now this comparatively light breechloader beat a lot of the heavier ones in the flatness of its curve, and if it could make a flat curve why should not the two muzzleloaders do the same, if they were as light as the breechloader, and yet the weight of the muzzleloaders must

always be harped upon as if it were their weight which caused them to beat. Eleven out of the 31 breechloaders weighed 10lbs. or more—why not harp on this fact?

The Merrill rifle was tested in a wind of 18 miles an hour, and the Rem.-Hep. in one of 7 miles. I know a wind of 18 miles will affect steadiness of curves, and I notice my curves were affected a little by it, and I think the screens were also, but it is all right and I accept it all in the best of faith. The muzzleloaders were, of course, bound to beat, for it was in them and their ammunition. I have often and often, in years past, given a reason for it.

Now to compare the errors (or inaccuracies) at 25yds.:

	1	2	3	4	5	
Rem. errors	+1.018	+.982	+.948	+.934	+.983	String 4.865.
Merrill errors	—.685	—.544	—.578	—.475	—.576	String 3.178.
Merrill beats	+.33	+.233	+.410	+.259	+.447.	1.687. Av. .34in.

Thus the muzzleloader beats at each shot for 25yds., and this quite badly, the least beat being in shot No. 2, .24 say one-fourth of an inch. This beat is in vertical trajectory error (commonly called accuracy) and is entirely independent of target accuracy, the latter is measured for a string, all around from the center of aim to the center of bullet holes, while the former is measured vertically from the line of sight or aim. Target accuracy is found at the end of the range, while trajectory accuracy is found all along the range. As before stated I would prefer to write error for accuracy.

Next pass on to 50yds. to examine the same shots:

Remington-Hep. Rifle, at 50yds.

Height of Traj's	1.815	1.870	1.970	1.777	1.801 above base.
Negative	—.330	—.330	—.330	—.330	—.370 above line of sight.
Errors	1.485	1.540	1.640	1.447	1.474. String 7.566in.

Thus this rifle shoots over the line of sight at midrange, the measurements being vertical, and from N, the center of aim on the 2in. bullseye, up to the trajectory.

Merrill rifle at 50yds.:

Ht. Traj's	1.573	1.498	1.397	1.051	1.210 above base.
Negative	—.33	—.33	—.33	—.33	—.33 below line of sight.
Errors	1.043	1.168	1.069	.721	.880 string 4.881 above L. S.

Thus this rifle shoots over at midrange, the measurements being vertical from N, the center of aim in the 2in. bullseye. See the diagram for the common base and for the line of aim on N at the center of the 2in. bullseye, and for the Rem.-Hep. and Merrill 2 mean curves at 50yds.

The five individual curves here considered would, if plotted in the diagram, fall a little above and below their mean curve plotted in the diagram.

Now to compare the errors at 50yds.:

Rem. errors	1.485	1.540	1.440	1.427	1.474 string 7.366
Merrill errors	1.043	1.168	1.069	.721	.88 string 4.881
Merrill beats	.442	.372	.371	.706	.594	2.485 Av. .50in.

Thus the muzzleloader again beats every shot at 50yds. As before stated, it beats in vertical measurements or trajectory accuracy, and this is entirely independent of target or screen accuracy. If at another trial specially for target accuracy the muzzleloader should again beat, then this amount must be added to the trajectory accuracy beat to get the total amount. The muzzleloader has always been a wonder for its close and constant shooting; the charge of fickleness has never been made against a good one.

Rem.-Hep. Rifle, 75yds.

Heights of traj's.	1.544	1.560	1.577	1.477	1.488 above base.
Negative	—.185	—.185	—.185	—.185	—.185 below L.S. at O.
	1.359	1.375	1.389	1.292	1.303 string 6.698in.

Thus the rifle shoots over O the center aimed in the common line of sight at 75yds. See the diagram for the line of sight and O and the common base for the mean curve of the 5 shots; the individual curves are not in the diagram, but only their representative, the mean curve.

Merrill Rifle, 75yds.

Heights of traj's.	1.270	1.205	1.419	1.051	1.421 above base.
Negative	—.185	—.185	—.185	—.185	—.185 below line of sight.
Errors	1.085	1.020	1.234	.866	1.236 string 5.441in.

Such are the errors or would be vertical measurements from the line of sight to the trajectories if the trajectories were plotted in diagram, but only their mean curve is in it.

Now to compare the errors at 75yds.:

Rem.-Hep. errors	1.359	1.375	1.393	1.292	1.303 string 6.698in.
Merrill errors	1.085	1.020	1.234	.866	1.236 string 5.441in.
Merrill beats	.274	.355	.159	.426	.067	1.277, Av. .25in.

Thus the muzzleloader again beats, this time at 75yds. As before stated it beats in trajectory accuracy, which is entirely independent of screen or target "accuracy" or more properly of screen and target error. I repeat these terms so as not to be misunderstood in my meaning—the bullet has no error when its center is in the line of aim, and its deviations therefrom are properly errors, not accuracies as generally called.

The rifle which shoots strong and steady will always beat in accuracy for the whole range the rifle which does not shoot strong and steady, and if we add to the former rifle (which imparts a great velocity and power to its bullet) the great merit of but little recoil at the same time, then such a rifle is worth a mint as a hunting rifle for all kinds of game, both large and small, and this, even though it shall require ten minutes to load it; quick loading without great and constant accuracy amounts to but a very little indeed, except for a very few special purposes. Of course the bullet in weight and diameter must be adapted to the purposes of the rifle. But powder it must have and enough of it too to give a high velocity to the bullet, the higher the better, provided it flies steady along the same course very nearly.

The diagram will teach better than all writing why the errors diminish each way from midrange to zero at the 2 points blank. It will tell why the muzzleloader beats all the breechloaders and this one by about one-third.

Summary of the Individual 5 Shots:

Point 1. We have now at considerable pains mathematically and practically proven that the Merrill muzzleloader beat the Remington-Hepburn breechloader in trajectory accuracy (less error) for each of the 5 shots in this test, and that, too, at 25, 50 and 75yds. We have also stated from your report that this breechloader made the flattest trajectory of any of the American breechloaders tested.

Point 2. The muzzleloader having thus beaten, with a heavy margin in its favor, the breechloader which made the flattest trajectory of any of the breechloaders, it is mathematically and practically true, that it beat the remaining 29 of them. Where does this leave the critics?

Many suppose that because the heights of the individual curves in your tables in the series of 5 shots with the different rifles differ but a very little (about ¾in., more or less), this conclusively shows and is proof that the bullets of each rifle were near together in their line of flight, and therefore must have made very close clusters in the screens and targets, so much so, as to cause the observer of the table heights to conclude they must have cut quite into the same common hole or break in the screens at midrange, and consequently that the rifles must have shot with great steadiness and accuracy (see some of the tables).

An examination of the tables very naturally leads almost any one to these conclusions, and we presume that 19 in 20 who have looked at them and hastily compared the heights of the curves, have formed a belief about as expressed above.

And yet such a belief as to the proof part is widely erroneous. The small difference in the heights of these curves does not prove either screen or target accuracy. The test itself, most fortunately, furnishes direct proof of this fact, as the large screens at midrange, as well as the large targets, have the 5 shots well scattered over them. The report teaches this fact, hence there is no necessity for seeing them on this point. The shots, the report says, were purposely scattered, and yet the heights of curves, measured from their bases, differ but a very little, and are just the same as if the bullets had not been scattered. The test was made on this theory, which is a correct one where the line of fire is a low one, as was the case in the test.

The tables are but the former scattered curves gathered and huddled together, as if on a common base.

The table differences show only in regard to regularity in the fall of the bullets. And regularity in fall is a good sign for accuracy, but it is not proof of it, for scattering bullets give small differences in heights, and the same differences, shot for shot, as if they do not scatter. Such was the correct theory of the test. The above principles apply to muzzle and breechloaders.

Close Shooting—What splendid shooting is here to be seen; this rifle misses (at most) only nine-tenths of an inch for 1143yds. Proof, see the column of "reduced errors" and the diagram.

The trajectory curved line corresponds to the center of the bullet, and hence the greatest trajectory error is but one inch and one-tenth (1.103) for 1143yds. Proof, see column of errors and the diagram.

Question—Does the muzzleloader shoot close?

Question—And can the sceptic or quibbler truthfully deny it?

Question—Can the breechloader ever hope to beat it for both target accuracy and trajectory accuracy, both to be made at the same time, with the same shots, in a trial of 50 or 100 shots? I am free to say I do not believe it can. I am writing as to hunting rifles and ranges only.

Test Shots 1 and 2—At the test my rifle for shots Nos. 1 and 2 had the same aim. Consequence: At 25yds. both bullets cut into the same hole, at 50 and 75yds. the centers of each bullet are within the size of a nickle, and at 100yds. both centers are within the size of a twenty-five cent piece. Proof, see the three screens and target. After shot No. 2 the aim was shifted by request at each shot, if otherwise a very close target would have been made.

If it had been tested at 200yds. it would have beaten the thirty-one breechloaders. Private trials with the same charge prove this to be so. Besides the charge of powder and weight of the bullet show this should be so. MAJ. H. W. MERRILL.

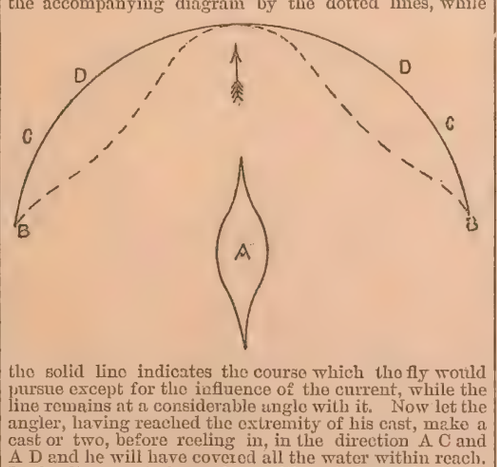
[TO BE CONTINUED.]

Sea and River Fishing.

Address all communications to the Forest and Stream Pub. Co.

SALMON ANGLING.

Editor Forest and Stream:



The subject of salmon fishing has been written about until there is little left to say that is new, but yet there remains a very little that will be new to some of the authors at least, and one or two little matters I propose to suggest with your permission, referring more particularly to Mr. Wells and his recent work, "The American Salmon Angler," which I have just read with keen pleasure. He advises, page 147, that after a fish has risen but refused, or missed the fly, the line should be gathered into the canoe by drawing it by the hand through the rings and allowing the slack to fall into the bottom of the canoe "thus preserving the exact range of the fish" while "resting him." Then, after the proper time has elapsed, he directs that casting should be resumed, paying out line in the ordinary method, except that it will not be off the reel but out of the coil, or more likely heap in the bottom of the canoe, until the exact spot where the fish rose is reached. This would be a capital plan if one could be sure that the fish he was after was the only one in the pool, but with fifty or perhaps a hundred feet of line off the reel, if a fish should rise and fasten, with a considerable portion of it yet lying in the bottom of the boat, the angler would be in a sorry fix. If he should attempt to hold the line in his hand while recovering the loose portion on to his reel, one of two things would occur, probably both. He would almost certainly get his loose line into a bad tangle, since he would be recovering from the bottom of the pile instead of the top, which would be fatal if the fish remained fast, but the chances are that he would have broken loose before that event could happen, certainly if held with a rigid hold. If the angler should attempt to give line by allowing it to slip through his fingers as the fish made a rush, he would probably have to resort to his medicine chest for sticking plaster for his lacerated fingers.

The writer tried this plan once in his callow days and the recollection has been a warning ever since.

A better way is to reel in properly and start fair, the range can easily be found again, or he may cast on the other side of the canoe for a little time if the conditions favor such a course, or if the fish run well on one side or the other of the boat he may simply allow his line to drift squarely astern until the proper time has elapsed, when he can make one or two preliminary casts in the air to free the line and fly from water and then drop it over his fish as gently as his skill will allow.

On page 139 Mr. Wells has furnished a diagram to illustrate his remarks on casting. His directions are clear and exact and his diagram is mathematically correct; theoretically they leave nothing to be desired except a rise, and it would appear that by following the directions closely all the water within reach would be perfectly covered; practically, however, it is not.

Salmon casting is almost never practiced in still water, but in sections where there is a moderately swift current, say from three to four miles an hour; now when the angler casts directly across such a current with a long line the inevitable result is that the line sags and the fly as it drifts down the stream, approaches the boat, until it is nearly astern, when of course the line straightens with the current and the fly reaches the furthest possible point from the caster, the course of the fly being indicated in the accompanying diagram by the dotted lines, while

the solid line indicates the course which the fly would pursue except for the influence of the current, while the line remains at a considerable angle with it. Now let the angler, having reached the extremity of his cast, make a cast or two, before reeling in, in the direction A C and A D and he will have covered all the water within reach. In the diagram A shows the position of the angler in his canoe and the arrow the direction of the current.

Now as to clogged reels, Mr. Wells gives on page 46 a graphic description of a calamity which has befallen most of us more than once, and very few of us know why. In such cases we curse the maker of the reel, and with some little reason, too, but we do not blame him for the right thing. We lay the blame on some defect about the click or the mechanism connected with it. In ninety-nine cases out of a hundred that part of the reel is all right and trying to do its duty, but cannot for reasons which I will try to explain. Every one has probably noticed that calamities of this kind overtake us oftener on rainy than on bright days. They may happen on any day, but more often on rainy ones. It is the crowding of the side of the spool against the outer case of the reel that does the mischief, and this is caused either by very close and hard packing of the line on the spool during a hard and long fight with a fish, or by the expansion of the line by reason of too much moisture, either of which will crowd the sides of the spool outwardly, and friction does the rest. This happens more frequently on a wet than on a dry day because the line remains wet. On a dry, warm day the line, as it comes home to the reel, has most of the water brushed off as it passes through the rings, and reaches its place on the reel in a comparatively dry condition, while on a wet, rainy day it remains wet, packs harder and expands more after it is packed.

I shall never buy another shop reel, but shall have them made to order, and the sides of the spool shall be twice the usual thickness, or there shall be small anti-friction rollers set into the outer case for the edge of the spool to play on; probably the former will be the more practical, as it cannot add more than an ounce or two to the weight and will be far more simple of construction. These are little things of themselves, but success or failure often depends upon attention to a great many little things all kept in mind. I dare say I could think of many others, but I have written enough for once, I think. One thing I will add, however: I indorse most heartily Mr. Wells's opinion of spliced rods, and of dowels as well; I shall continue to fasten my joints together so as to prevent throwing apart, however.

If any one doubts the correctness of my theory of the cause which makes the salmon reel refuse to work at times, let him try the experiment, which he can easily do by wedging the sides of the spool apart by means of a stout stick very firmly pressed in between the sides of the spool, and he will soon be convinced. Of course, the narrower and deeper the spool the more danger from this source. SALMON ANGLER.

SALMON IN THE HUDSON.

Editor Forest and Stream:

Mr. A. N. Cheney's communication to the Eastern New York Game Protective Society, which appears in your impression of the 15th January, is most interesting. There are, however, some conclusions in it which my experience compels me to differ from, and these I will briefly enumerate.

Mr. Cheney doubts that the fish seen by Hudson in 1609 were salmon because they were low down the river in September. I do not know that the fish seen were salmon, but the above is no reason against the supposition. In Canadian rivers there is always a run of spawning fish in September, and these fish spawn all along the rivers, sometimes even in salt or brackish water (when, of course, the eggs are killed). As a rule it is only the early fish that reach the headwaters at all, unless the river be very high, when the later run fish get helped along wonderfully.

As to the average height salmon can clear being 12ft., a baggit heavy with spawn will not clear that height, I feel sure, and these are the most valuable fish. California salmon have been "planted" in the St. John and Tobique, but do not seem to thrive in our rivers. Certainly some other cause than temperature must be at work, as these rivers are fully as cool as the Pacific coast rivers in which they thrive. CHAS. T. BRAMBLE.

FREDERICTON, N. B.

BULLHEADS THAT GIVE DOUBLE PLEASURE.—Agawam, Mass.—As I read the accounts of the encounters of some of your correspondents with the mighty salmon and gamy trout, my mind goes back to the days of last June when I too went fishing, not with patent tackle and fluttering fly deftly cast for such aristocratic game, but with straight 18ft. cane pole, 75ft. of silk line, plain reel and wriggling worm, for just whatever fish would bite. And bite they did, for one rainy afternoon, although fishing in waters less than one mile from the center of the city of Springfield, Mass. (and which are strained each spring time and time again through a fine mesh net), in three and one-half hours, I caught 108 bullheads and 4 other fish; and few a days later, with a friend of mine, I had equally as good success. I never taste of these fish, but I number among my friends several to whom they are very welcome, so that I have the double pleasure of catching them and giving them away. As my work takes me across the ice these wintry days, I wonder where the fish are that I shall take next year and what they are doing now, and through what adventures by flood and field and hair-breadth escapes they must pass before they come to my basket. But after all to any one who loves the rod and the rainy day, it is only half of fishing to catch fish. My mind does not picture the biggest fish taken, but rather the scudding of the rain across the meadows, the flight of some wild bird or the splash and swirl of some great fish feeding; and then, too, the borders of the pond where I fish are made beautiful by the white water lilies, and I can almost catch their fragrance to-night; and over and above it all is the sense of the richness and gladness of a rainy day in June. After all "the happy hunting grounds" may not be all a myth. We may see them yet, and hunt among their mountains and fish in their waters; the great trees there will not be cut down or the prairies turned into wheat fields. At least let us hope so and be glad in the thought.—PINE TREE.

THE SIX-INCH TROUT LAW.—Fish and Game Protective Association, Utica, N. Y., Jan. 21.—*Editor Forest and Stream:* The assertion of "Angler" in your issue of 20th inst. that "trout in the third year will not measure six inches" is evidently guess work or buncombe. If the gentleman would revise his "facts" he would not make such an assertion, nor the other one that six-inch trout "do not frequent the riffles." The wording was "under six inches," and those who then wanted it five, now declare that even seven inches would be small enough. "Angler" will look long to find a trout under five inches that will measure three inches in May or June. He ought to apply for a special exception for himself, as that seems to be the rule in Jefferson county. The bill introduced by Mr. Coggeshall restores the six-inch law and makes the law uniform for the whole State April 1 to Sept. 1, salmon-trout and landlocks, April 1 to Oct. 1. Due regard for preservation would require a more limited season by the month of April, or part of it, cut off, but New York people are so strenuous in opposition that it is felt better to leave the season as above for the whole State. It would be unjust for one section of the State to have different seasons, or privileges than another. The public, however, have yet to learn that April trout are not prime. In regard to April shooting of ducks, the bill has been introduced to meet the general public sentiment in this respect. Spring shooting is now prohibited by Canadian laws, and there is every reason why we should protect them while they are on their way to nesting grounds.—U. F. & G. PROTECTIVE ASSOCIATION.

FAIR HAVEN, Vt., Jan. 18.—At the annual and special meeting of the Eagle Rod and Gun Club, Albert I. Johnson, of Hydeville, was elected President; Rolland C. Reed, of Fair Haven, Vice-President; Geo. M. Fuller, of Fair Haven, Secretary and Treasurer; Dr. Chas. H. Carpenter, Rolland C. Reed, Merrit T. Mead, Hugh S. Humphrey, of Fair Haven, and B. F. Graves, of Castleton, executive committee. The club hold meetings regularly once a month, at which some member reads an essay or an extract from some work. The club is now interested in stocking streams and the enforcement of the laws about fishing.—NED.

Fisheulture.

Address all communications to the Forest and Stream Pub. Co

A JAPANESE STUDENT OF FISHERIES.

TWO months ago Mr. K. Ito, a native of Japan, who has received a thorough English education at home, arrived in San Francisco. He came to study American methods of fisheulture, fish capture, and everything connected therewith. He went directly to Washington where he spent some time with Profs. Baird and Goode in the Smithsonian Institution and the National Museum, and then visited Mr. Frank N. Clark, in charge of the U. S. Hatchery at Northville, Mich., where he saw the process of hatching whitefish and trout. Then he visited the U. S. Salmon Hatching Station at Bucksport, Me., in charge of Mr. H. H. Buck, where he saw the operation of taking spawn, etc. At Greenport, L. I., he visited the menhaden fleet, and next summer he will inspect the oil and guano works near there. At Cold Spring Harbor he was the guest of Mr. Fred Mather, and there he saw the hatching of tomcods in salt water as well as the whitefish and trout-eggs. The tomcods were just hatching and Mr. Ito was greatly interested in seeing them come out of the egg and pass up the glass tubes and over into the aquaria. On Saturday last he inspected Fulton Market and dined with Mr. Blackford, and has now gone to Gloucester, Mass., to go out in the Grampus with Capt. Collins and see how the cod and the halibut are taken. Later he will visit Wood's Holl, and in May will attend the angling tournament in New York city, and then go to Washington to attend the meeting of the Fisheries Society. After inspecting the shad and striped-bass fisheries of North Carolina he will go to the Pacific coast and see the salmon catching and canning, and then return to Japan.

Mr. Ito is President of the Fisheries Society of the Island of Yesso, which has been recently settled by his people and he will, on returning there, make a report of what he has seen and learned in America and will ask for an appropriation for the purposes of fisheulture. He tells us that he is well pleased with what he has seen so far and that he has met with a kind reception everywhere he has been. We have been impressed with his intimate knowledge of many things pertaining to America, from its geography and history to the personnel of the U. S. Fish Commission and the work they have done. We are promised an occasional contribution from him after his return.

We learn that some Japanese rivers swarm with salmon and that this fish will receive the first attention in his proposed inauguration of fisheulture. He will also try to increase the mollusk, whose shell is used here for ornament and called Abelone or "Venus's ear," *Haliotis*, for it is much used as an article of food by the poorer people and tons of it are dried and exported to China. This mollusk is found on our Pacific coast, but is not used as food here, so far as we know, unless by the Chinese.

Besides those cosmopolitan fishes, the herring and the eel, the Japanese have the fresh water suckers, which are unknown in Europe, a species of horsefoot crab, smelts and many other forms common to the Eastern coast of America. In the salt water they have the red snapper (*Lutjanus blackfordii*) which is common to our southern Atlantic coast, and this fish is always served at wedding feasts, but if not in season or procurable, a wooden representative of it is placed upon the table. Crabs abound in the waters, and the spider crab is considered a great delicacy. Mr. Ito will present Professor Baird with alcoholic specimens of the marine and fluviatile fauna of Japan, and an exchange of the aquatic life of Japan and America will follow. We look for another visit from him on his return from the East in April next.

REPORT OF MASSACHUSETTS COMMISSION.

WE have the 21st annual report of the Fish and Game Commissioners of Massachusetts, for the year ending December 31, 1886. There have been no complaints as to the working of the fishways, and only two applications for the construction of new ones. The report of Mr. Holmes, in charge of the Lawrence fishway, covers the time from May 1 to June 30, three days in September, and one in October. The run of fish through May and part of June, consisted of lampreys, alewives and suckers. On June 10 one salmon of 12lbs.; June 20 two salmon of 10 and 12lbs. respectivey; 22d two 12 to 14lbs., and two more on June 24 of 10 to 12lbs. The alewives stopped running on June 4, but the lampreys kept it up all through May and June. After the 1st of July the flow of water grew less and less, and on the 12th it was shut out of the fishway, as there was no water running over the dam and only a few suckers in the fishway. The river began to rise again about September 17 and the following day water was let in. The suckers began running the next day, and salmon were seen below. On September 21 one salmon of 8lbs. went up, on the 26th two of 8 to 12lbs., and on the 28th two of 14lbs. On October 5 two salmon of 6 to 8lbs. ascended, and the water was shut off again from October 10 to the 31st, and on November 4 the last salmon was seen.

The menhaden which were so plentiful in the bays years ago, appear in many cases to have entirely deserted them. The Commissioners say that the theory that no amount of fishing could materially lessen the deep-sea fisheries appears to be losing ground, and the intelligent fishermen are struggling for a law to protect the mackerel during their spawning season. They also say that the driving away or the destruction of the menhaden has decreased the catch of bluefish, and that if the New England States had combined and protected the menhaden in their bays and estuaries they would probably have added millions of dollars to the value of their in-shore fisheries.

The run of salmon in the Merrimac last spring was smaller than usual, and led to the conclusion that this was an off year for these fish, but the fall run was the largest that has occurred at that season. The hatching of these fish is done by Col. E. B. Hodge, of the New Hampshire Commission, at the works under his charge at Plymouth, who reports that he received from Bucksport, Maine, 550,000 Penobscot salmon eggs and took 60,000 eggs from fish in the Merrimac river. The fry from all of these were planted in the Pemigewasset river.

Col. Hodge reports the number of brook trout eggs taken as 500,000, of which one-half were sent to Mr. Brackett, at Winchester, in February and March.

Shad hatching on the Merrimac was continued. Six hundred thousand fry were produced and turned into the river at North Andover. There was a decided increase in the run of fish during the past season, which is encouraging considering the low state to which the shad fisheries of the Merrimac had been reduced in 1881, and it is gratifying to learn that the propagation of this fish has tended to increase the catch. There is an extended reference to the old trouble between the Massachusetts and Connecticut fishermen and the Commissioners of those States, concerning the shad fisheries of the Connecticut river, to which we referred in our review of the report of the Connecticut Commissioners (FOREST AND STREAM, December 2, 1886). The report questions the accuracy of some statements that have been made concerning this difficulty, and says that the last Legislature of Massachusetts passed resolutions in regard to the fisheries of the Connecticut river which were forwarded by the Governor to the Governor of Connecticut, and which were referred to the Fish Commissioners of the latter State to investigate and report. Their report, which is given in full by the Massachusetts Commissioners, is said to be "at first glance a fair answer to a part of the resolutions, but it is nevertheless at variance to the real cause of complaint." Besides the pound nets at the mouth of the Connecticut, it is claimed that the dam at Enfield is an obstruction to the passage of shad, and that evidence before the legislative committee shows that the fish could not make their way over the dam at low water, but congregated in pools below, where they were caught. It is suggested that if all fishing could be prohibited for a reasonable distance below this dam better results would follow. The Commissioners take issue with the gentlemen from Connecticut on the statement by the latter that the real cause of the diminution in the number of shad is due to the result of the act passed by Massachusetts in 1881, which extended the fishing season from the middle of June to the first of July, and reduced the size of the mesh in the nets from five inches to two, and say that "while said act may have been unwise and perhaps prompted by a feeling of retaliation on the part of the fishermen for the injuries done them, and for which they have no hope of redress," they see no reason why this should be used to "divert attention from the well known cause of the scarcity of shad in the river." They state that heretofore there has been no difference of opinion between the Commissioners of the two States upon this point, and point to the fact that in 1879 through the success of artificial hatching the catch on the lower part of the river reached 436,981 shad, while the catch in Massachusetts for the same season was only 13,409, and the argument is continued further as to who killed the goose that laid the golden eggs.

This is followed by a report of Mr. C. C. Smith, of Springfield, Mass., who gives an account of the shad hatching done at Holyoke from 1837 to 1875, mainly by himself, and an account of the moneys received and sources from which it came, some of it, 1871 to 1874 paid by Connecticut, 1874 by Connecticut, Prof. Baird and Mr. Brackett for Massachusetts, and 1875 by Prof. Baird, of the United States Fish Commission; while from 1881 to 1883 he hatched at his own expense many millions of young shad and turned them into the river.

This dispute between these two States, one owning the upper and one the lower river, is very much to be regretted, as it seems as though among men of such exceptional intelligence as comprise the Boards of Fish Commissioners of these States, some basis of settlement of the disputes between their respective fishermen could be arrived at to the benefit of all concerned. We have not the slightest doubt that such settlement would be for the best interests of all parties, as it is probable that the United States Fish Commission might join in and help out in shad hatching, as the season on the Connecticut river begins after the work on the Patomac and other southern rivers is closed, but might not care to appear to take any part in any quarrel which was going on; in fact, the discussion on both sides has reached a point when it would be well to cease.

The appendices contain a list of the Fish Commissioners of the different States, list of ponds leased by the Commissioners, a quotation concerning the Connecticut river, from the Massachusetts report of 1878, with comment by the Commissioners—in which by invitation of the Committee on Fisheries of the Connecticut Assembly, the Massachutes Commissioners appeared before them and made a statement concerning the salmon in the Connecticut river. In the comments they say that "it was obvious from the outset that their errand was a vain one," etc.

It is cheerful to turn from this discussion to an illustrated article covering several pages on "Belostomidæ and Some Other Fish-destroying Bugs," by George Dimmock, which deserves more space than we can now afford it. The report closes with the laws and resolutions of 1886, and tables showing the returns of weirs, seines and gill-nets.

ALEWIVES IN MAINE.—From the report of the Commissioners of Fisheries and Game of Maine, we quote the following on the disappearing of the alewife, by Mr. B. W. Counce, Commissioner of Sea and Shore Fisheries: "In the summer this fish abounds in the coast waters of all the Atlantic States from Maine to Florida, in winter only south of Cape Hatteras. This fish is a very important one in this State as an article of food, but it is fast disappearing, and unless better protected will wholly disappear as the porgie has. The alewife is caught in Damariscotta and Georges rivers in large numbers and pays quite an amount of the taxes in Damariscotta, Newcastle and Warren. The right to catch these fish in Damariscotta Mills was sold in 1884 for $3,555, in 1885 for $2,510, in 1886, $1,055. The parties buying the right to fish at the Mills do not have the right to catch fish on the river or back streams. It will be seen by the above statement that the value of these fish is growing less every year. There are now on the Damariscotta River twenty-five weirs and on the Georges River fifteen, besides the nets. Such being the case, it makes it very hard for the fish to overcome those obstacles and reach the ponds to deposit their spawn. Something should be done to prevent such wholesale destruction of the young alewives as they return to the ocean. Thousands of them are ground to chum every season as they return by the mills on these streams. The last Legislature passed an act granting the town of Union the right to take alewives for two days in the week on the spending grounds in Georges River. 'This was the unkindest cut of all,' and such an act should never have been passed. The passing of so many special local laws is much to be regretted, as their workings are productive of much harm, and I hope the growing practice will be discontinued."

HAMMOND, Ill., Jan. 29, 1887.

U. S. Cartridge Co., Lowell, Mass.:

DEAR SIRS—To-day I made a test of shells and settled in my mind a long disputed fact in regard to the amount of times the U. S. shells could be reloaded. I took five shells from a box of 100, and shot them as fast as I could get them reloaded. The following is the result: First shell, 9 times; second, 11 times; third, 10 times; fourth, 13 times; fifth, 9 times. I could have loaded and fired some of them again, but the above result settled the question of their reloading qualities in my mind. I am sure all hunters and shooters ought to know of the good qualities of this shell, and I give you liberty to publish this, and will further say I am not in any way interested in any shell company, and give this letter for the benefit of all sportsmen. I am sure we are all seeking for the best, and if I can assist any one to find the best I will gladly do so, and this is my reason for sending your company this letter. Wishing you every success, I am, yours truly,

(Signed), L. S. CARTER.

HALE'S HONEY OF HOREHOUND AND TAR softens the cough, relieves the windpipe and bronchial tubes of mucus, tones the lungs and the membranes of the throat, and restores to the organs of respiration their natural strength and vigor. PIKE'S TOOTHACHE DROPS cure in one minute.—*Adv.*

FIXTURES.

DOG SHOWS.

January, 1887.—Bench Show of Poultry and Pet Stock Association, at Adams, Mass. W. F. Davis, Secretary.

Feb. 8 to 11.—Southern Massachusetts Poultry Association Bench Show, Fall River. A. R. G. Mosher, Secretary.

March 22 to 25, 1887.—Spring Show of the New Jersey Kennel Club, Newark, N. J. A. C. Wilmerding, Secretary, Bergen Point, N. J.

March 29 to April 1, 1887.—Inaugural Bench Show of Rhode Island Kennel Club, Providence, R. I. N. Seabury, Secretary, Box 1533, Providence.

April 5 to 8, 1887.—Third Annual Show of New England Kennel Club, Boston. F. L. Weston, Secretary, Hotel Boylston, Boston, Mass.

April 12 to 15, 1887.—Thirteenth Annual Dog Show of the Western Pennsylvania Poultry Society, at Pittsburgh, Pa. C. B. Elben, Secretary.

May 5 to 6, 1887.—Eleventh Annual Show of the Westminster Kennel Club, Madison Square Garden, New York. James Mortimer, Superintendent.

FIELD TRIALS.

Feb. 15, 1887.—Inaugural Trials of Tennessee Sportsmen's Association. Entries close Jan. 10. R. M. Dudley, Secretary, No. 64 Broad street, Nashville, Tenn.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **4606.**

THE BEN HILL—LILLIAN HEAT.

WE have as yet heard nothing from Mr. D. Bryson in regard to his charges against the reporters at the recent field trials in Tennessee. We presume, however, he is hard at work formulating his allegations, collecting proof, writing out his manuscript in a clear, legible hand, adding a paragraph here, pruning another there, and perhaps even sending it out to have it type written, so that the compositors will be in no danger of making mistakes with it. It would seem that he has had time enough to have got the matter in shape before now, but possibly there may have been delays. It is conceivable that Mr. Bryson may have been sick, or may have had writer's cramp or perhaps may even have fallen down and broken his arm so that he cannot write. However, we trust that none of these calamities have overtaken him. No doubt to-morrow or the next day or at latest next week, we shall receive his manuscript, when we shall be able to lay before our readers the story on which Mr. Bryson based his insinuations of two weeks ago.

Editor Forest and Stream:

As to the question of the ruling of the Executive Committee of the National Field Trial Club in the matter of the protest of Mr. Rose against the changing of the running of Lillian and Ben Hill from the regular order. That the case may be understood we present the following record. In the first series of heats Lillian (owned by the Messrs. Bryson) was drawn to run against Gladstone's Boy, with Mr. Stephenson as exhibitor (or handler). Lillian won. Ben Hill (owned by Mr. Stephenson) in the first series of heats was drawn to run against Beaumont, with Bevan as handler, and won. Under the rules Lillian and Ben Hill would compete in the next series of heats, as Lillian beat Gladstone's Boy (these two dogs ran the first two heats). Mr. Stephenson, being secretary of the club, changed the running of these dogs, separating Lillian and Ben Hill, arranged that Lillian should run against Daisy F. and Ben Hill against Don's Dot, and Mr. Rose entered a protest against the change, claiming that Lillian and Ben Hill should run against each other. It is claimed by Mr. Stephenson that the change was proper under the following rule No. 2 of the National Field Trial Club:

"If two dogs owned or exhibited by the same person should be drawn to run together, or come together in any successive heat, the second dog shall change place with the next dog in the order of running." It is well at this point to inquire for what purpose this rule was adopted by the club. The purpose was to encourage as many entries as possible from one man and to prevent one man's dogs being run against each other and beating each other instead of a chance to win from an outsider, and to prevent one handler from handling two dogs either owned by one man or owned by different men. To illustrate, the rule written out in full would read as follows: "If two dogs owned * * * by the same person should be drawn to run together or come together in any successive heat, the second dog shall change place with the next dog in the order of running."

The application of this rule as written is this: Suppose Mr. Hammond had two dogs entered for the race, say both in Short's hands as handler, they could not run together because they both belonged to Hammond. Suppose one was in Tucker's hands and one in Nesbitt's hands as handlers, they still could not run as they both belonged to Hammond. They should not run against each other as long as it could be avoided, as Mr. Hammond should not have to make one of his dogs beat one of his own, but should rather have the chance of trying to beat some other one in the heat. The rule would give him two chances, where if he ran his own together he would have but one chance.

Again the rule would read if written out in full: "If two dogs, * * * exhibited by the same person, should be drawn to run together or come together in any successive heat, the second dog shall change place with the next dog in the order of running." Now to illustrate this (exhibited means handled) take the following example. Suppose Titus has a dog belonging to Mr. Smith and one belonging to Mr. Jones, he (Titus) is the (exhibitor) handler of both and should not for obvious reasons be required to run them together. Mr. Titus would find it much more agreeable and satisfactory, especially so if Messrs. Smith and Jones were present, to run each one of these dogs against some other dog handled by another gentleman, and besides a handler should not be compelled, if it can be avoided, to beat himself by running two dogs together which he himself is responsible for and may have trained, and besides he may (as is quite probable) be interested in the prizes; he therefore should have a chance to run the two dogs against outsiders, as it would give him two chances.

Now, as to the ruling of the Executive Committee, what does the record show?

First—Mr. Stephenson entered the race with Lillian (belonging to the Messrs. Bryson) as exhibitor (handler).

Second—Mr. Bevan entered the race with Ben Hill (belonging to Stephenson) as handler (exhibitor).

Third—Now was Mr. Stephenson the exhibitor (handler) of the two dogs? The record says not, therefore he cannot claim the application of the rule on that account.

Fourth—Was Mr. Stephenson the owner of the two dogs? The record says not, therefore he cannot claim the application of the rule for that reason.

Fifth—Suppose Mr. Stephenson should have come on the ground with Lillian, and Bevan should have come on the ground with Ben Hill to run their heat together, on what

ground could any one have properly protested against their so running? Bevan had already run a heat as handler of Ben Hill and was recognized as Ben Hill's handler (exhibitor). Stephenson had already run a heat with Lillian as her exhibitor, and was recognized as her handler by the judges. Could any one have justly claimed to the Executive Committee that under the rule referred to they should not run together? Could not Mr. Stephenson properly and justly have claimed that he did not own both dogs and that he was not the exhibitor of both, that he handled Lillian, and Bevan handled Ben Hill?

Sixth—If Mr. Stephenson could justly claim this, he certainly should not be able to change the running by any method of special pleading.

We will not go into the question of motive or the delicacy of the situation, or what the social or business relations of any of the parties to the question might be or whether one might prefer another to have a good thing rather than to have it himself, or whether one dog was better than the other. Such matter is not pertinent. The question is as to the rule and the application as made by the Executive Committee. We are decidedly of the opinion that the protest was rightly sustained. A gentleman undertakes to plead in mitigation for this offense of Mr. Stephenson, the social and friendly relations existing between Lillian's owners and himself and says, "The Executive Committee made a great blunder." We have shown this is not so. Again the gentleman says, "Mr. Stephenson was forced to cut his own throat." If Mr. Stephenson suffered that misfortune we contend that he was alone responsible for it. He could not plead ignorance as to the rules. He entered and ran three of his own dogs, and Bevan ran another (Ben Hill) for him in the All-Aged Stake. The Messrs. Bryson ran in this stake at least three, Pet Gladstone, Dan Gladstone and Chickasaw II. Bryson's dog Gladstone beat Stephenson's dog Lady C., and Bryson's dog Dan Gladstone beat Noble C., belonging to Mr. Stephenson. Besides this, Stephenson handled Bob Gates and still owned at least one in the Derby. Mr. Stephenson must have known the chances were largely in favor of his dogs and the Brysons' coming together, and it appears there was no thought of being placed in a false position until Ben Hill and Lillian came together. It appears that Bevan (who handled Ben Hill) was doing right well and performing his full duty until interfered with, so no complaint could be made on that score. So really it comes down to the question whether Mr. Stephenson could be implicitly relied upon to handle Lillian to the best advantage, and if by so doing he lost, any one could justly reflect on him. It was a matter entirely in his hands. He had a duty to perform, and he might have performed it to his own satisfaction and let the matter rest there. He could have done this as well as he could, had Bob Gates and Lillian come together, and he had to handle both, which was possible under the rules. What has the "cry that would have been raised" got to do with it? Are the rules to be applied in a certain direction to prevent any one from "crying" as they please? We hope not. Again, the apologist for Mr. Stephenson says: "Mr. Stephenson knew he was not jeopardizing any one's interest but his own." This we think a very broad and suggestive statement to make. We are of the opinion that the interests in this heat were not confined to Messrs. Stephenson and the Brysons. Every dog, handler and owner would be affected by the heat and the result of same, and if Mr. Stephenson and those who undertake to plead his case, do not know this and do not recognize it, they should at once assume and claim that when the rules in their operation conflict with the social or business relations of these gentlemen, they are of no binding force and all other interests should be ignored. We think differently, and we are glad that the officers of the National Field Trial Club appear, from the decisions made, to differ also.

The question was properly submitted to the Executive Committee and Mr. Stephenson was acquainted with the fact and what the decision was; whether the decision was right or wrong he assumed grave responsibilities when he set the decision at defiance by doing as he has admitted he did do, and now it remains to be seen what the Executive Committee will do under the circumstances. We believe we may safely wait with the full assurance that such men as Messrs. Harris, Logan, Stoddard, Renfroe and Stone will act justly and mete out actual justice to all concerned, to the Club and others in interest. PARLIAMENTARIAN.

RICHMOND, Va.

LICE ON DOGS.

[From the FOREST AND STREAM, Feb. 23, 1884.]

WE have recently received several communications requesting information as to a sure method for ridding dogs of lice. Almost all of the various remedies that are recommended for their extermination will have the desired effect providing they are promptly applied. None of them will accomplish the purpose unless so applied. We have repeatedly stated that "eternal vilgance is the price of freedom from fleas." This axiom is especially applicable when seeking to circumvent the bloodthirsty *lus*. The main difficulty in getting rid of these troublesome pests is owing to a want of care in applying the remedy. The louse is very prolific and matures at a very early age, and as none of the various remedies will destroy the vitality of the egg, no matter how thorough has been the war of extermination, a day or two will see their ranks again full. It is necessary, therefore, in order to make a sure job of it, that the work be thoroughly done in the first place and thoroughly repeated at least once a week, until "the last armed foe expires." Persian insect powder, when rightly used, answers the purpose very well, and is perhaps the most cleanly and least troublesome method in cold weather, but as the powder only stupefies and does not kill the insect, it is necessary to follow its application with the fine comb, of course destroying by fire every captive. To apply the powder, place the animal upon a large sheet of strong paper, and with an insect gun or common pepper box thoroughly dust the powder into every portion of his coat, following this with a vigorous shampooing until every insect receives its share. Most of them will at once vacate the premises and fall upon the paper. Those that remain must be found with the comb and all thrown into the fire. This should be repeated every three or four days until the parasites all disappear. A decoction from quassia wood will also destroy lice. Take two or three ounces of the chips and tie them up in a muslin bag. Suspend them in a pail of water, stirring occasionally. After two hours the decoction is ready for use. Apply it freely with plenty of soap and rinse off with clear water. Strong tobacco water, applied in the same manner, may be used with good results, although it is apt to make the animal sick. Whale oil, freely used, is also sure death to lice. This should be thoroughly washed out of the coat within a few minutes after using on account of cleanliness. There are many other remedies that will accomplish that purpose, but those mentioned will be found amply sufficient. Mercurial preparations of all kinds are never to be used for this purpose, as bad results are always sure to follow. Neither can kerosene be recommended for the same reason. It is absolutely necessary that the kennel and bedding be attended to or all of your labor will be in vain. A good coat of whitewash put on hot, taking care to fill up all the cracks, will render your kennel almost insect proof. The bedding should be changed often. Cedar shavings make the best bed, although those of pine will do very well. The bedding of dogs who sleep in the house should be frequently scalded out in strong soap suds, and after rinsing in clean water, hung in the sun until perfectly dry. By closely observing the above rules any one can soon rid his kennel of both fleas and lice.

DISCIPLINE BY DOG TRIBUNALS.

Editor Forest and Stream:

You seem to have a fruitful subject for sermonizing in that "Ben Hill-Lillian" affair. I do not pretend to understand the matter in its details, and have no opinion to express on its merits or demerits; but the position you take, *i. e.*, that a wrong is a wrong, and should be reprobated as such, irrespective of the motives of the wrong doer, is so self evidently correct that I am puzzled to understand how an apologist for the wrong can be found.

But the most serious feature of such cases as this one is the slipshod, whitewashing way in which they are dealt with by the bodies whose special function it is to deal with them. Take the A. K. C. If there is one object for the accomplishment of which it can justify its existence, it would seem to be the punishment of the knaves and dirty curs that infest dog matters; the impostors who concoct false pedigrees; the swindlers who enter dogs at shows with wrong ages; the knaves who scheme to "work" the judging; the clubs who defraud exhibitors, or the easy-going fellows who enter dogs in classes knowing their ineligibility. Now, in all honesty, can it be said that the A. K. C. has yet done one act in this direction? Like—(somebody) I "pause for a reply." Look at the "burking" of the St. Elmo case, with the manifold kaleidoscope ages and pedigrees of the dog. Mark the dismissal of the "Chicago special" case; the beating of the exhibitor out of his dues for nearly a year is condoned because the money was used for club purposes! Note the fooling with the "Sensation" case at Boston, occurring nearly two years since; remember with astonishment that the "Sans Souci" case has been under advisement of one kind or another for over a year, and here is a man that hasn't been able to find out, after a year's trying, whether he is to be permitted to show dogs or not! We will see what becomes of the "Pewter-Medal" investigation: I predict a verdict of "not guilty, but don't do it again."

There is unquestionably an impression abroad that "dog" business is apt to be dirty business; that a "dog" man is a synonym for a trickster. Of course, like everything else in the world, it is true to some extent, but entirely erroneous to the extent commonly believed; but will you please point out a better way of confirming this impression than the shilly-shally way of dealing with culprits, that marks the course of all our dog tribunals? I have heard it stated that it is the certainty of punishment, not the severity of it, that deters criminals, and as a corollary it would seem to follow, that this certainty of prompt enforcement of justice would do more to disabuse the public mind of their erroneous views of "dog men" than all the platitudes and stuff about "gentlemen," "high position," etc., that the bootlick brigade give us such doses of.

It is not such a terrible task to clean out our Augean stable as is commonly supposed; the laborers at such a task will encounter some bad smells, and make some enemies among the "dirty dozen," but the fresh air of cleaned out quarters, formerly reeking with mal odors, is bracing and invigorating, and the hearty "well done!" of one decent man far outweighs the wrath of ten gutter curs offended by honest, wholesome "sitting down on." I speak whereof I know; I flatter myself that I have incurred the ill will of as many skunks as anybody, but I know I never lost a wink of sleep on that account, and the honest approval of one of the many decent fellows who have honored me with their indorsement overbalances the ill will of all the "gutter brigade" between here and Alaska.

Will not the A. K. C. take up its proper and urgent work in sincerity? Let it give us an earnest of its purpose, that as far as in it lies, the next year of shows shall be marked by honesty both in clubs and exhibitors, or some offenders shall be made such examples of, as to deter for one while others from following in their footsteps. In place of being so everlastingly good-natured, let them be cross and disagreeable for a while. In place of letting offenders go because they are "good fellows," let them put a few knaves in the pillory of public scorn and contempt that they have let down on their shanks. Nothing it can do will so surely elevate the A. K. C. in public estimation as an ornament to American dog affairs. Of course, it must not be understood that I lump all the parties to the cases I have named in one lot. Of the Sans Souci case I know very little positively; in the Sensation case I strove to have the A. K. C. take it up, decide that the entry was irregular, but that the manifold confusions that "construction" had left on this subject, the contradictory decisions of the N. E. K. C., and the fact that the dog had no competitors, so that no one was wronged, and its having been done openly, without deceit, made it expedient to dismiss the case as unworthy of further consideration. What I complain of in this case, is that the A. K. C. still has the W. K. C. on trial, and decides nothing. W. WADE.

HULTON, Pa., Jan. 15.

COLUMBUS DOG SHOW.

Editor Forest and Stream:

The Columbus bench show opened on Monday the 21st with 175 entries and no absentees. For the first show this was a good one, and by next year we hope to have as fine a show as there is in the country. Following is a list of the

AWARDS.

MASTIFFS.—*Dogs:* 1st, A. E. Pitt's Douglass; 2d, Geo. A. Peteno's Ilford Hugo III. *Bitches:* 1st, Geo. Gillivan's Ashmont Bertha; 2d and high com., A. R. Wood's Nell and Judith. Very high com., J. L. Mock's Queen.

ST. BERNARDS.—ROUGH-COATED—*Dogs:* 1st, G. H. Hill's Peter; 2d, withheld. Very high com., G. Luchtenberg's No Name. *Bitches:* 1st, withheld; 2d, G. Stewart's Mollie. Com., W. Neddermyer's unnamed. SMOOTH-COATED—*Dogs:* No entry. *Bitches:* 1st, withheld; 2d, G. Stewart's Jula.

NEWFOUNDLANDS.—1st, G. H. Hill's Carl.

DEERHOUNDS.—1st, G. H. Hill's Dart.

GREYHOUNDS.—*Dogs* and *Bitches:* 1st, J. F. Nicholson's Belle; 2d, Dr. W. Aspinwall's Daisy. Very high com. F. Talmage's Duke.

FOXHOUNDS.—1st and 2d, L. Tolliver's Spring and Mohawk, Jr.

ENGLISH SETTERS.—*Dogs:* 1st, Dr. Todd's Ned; 2d, Sherman & Kalbe's Don. Very high com., C. Conrad's Don. *Bitches:* 1st and 2d, Geo. H. Hill's Clara F. and Kate. Very high com., F. W. Butler's Sue and C. W. Kuhnheim's Fannie. High com., Geo. H. Hill's Melissa. Com., W. F. Kuell's Maud.

IRISH SETTERS.—*Dogs:* 1st, I. H. Roberts's Bruce; 2d, C. Velton's Don. Very high com., Geo. C. Urlin's Don. *Bitches:* 1st, I. H. Robert's Leigh Doane; 2d, S. S. Seiber's Belle. Very high E. Taylor's Bessie.

GORDON SETTERS.—*Dogs:* 1st, G. Hoddland's York; 2d, P. P. Collin's Hector. Very high com., G. V. Neal's Prince G. High com. Dr. J. R. Flower's Ned. *Bitches:* 1st and 2d, B. F. Lewis' Rose and Rhoda. Very high com., Geo. V. Neal's Mab.

POINTERS.—*Dogs:* 1st, J. Flower's Don; 2d, T. McCabe's Echo. Very high com., Geo. V. Neal's Hairspring. High com., Geo. C. Urlin's Count. *Bitches:* 1st, W. Neddermyer's Corsicana Tobe; 2d, withheld. Com., J. L. Flower's Zip.

IRISH WATER SPANIELS.—*Dogs:* 1st, John Cummings's Capt. Muldoon.

FIELD SPANIELS.—1st, A. E. Evan's Tip.

COCKER SPANIELS.—LIVER OR BLACK—1st, J. Cummings's Bo Peep; 2d, R. L. Willie's Duke. Very high com., John Cummings's Lady Babcock.—ANY OTHER COLOR—1st, Geo. H. Hill's Fanny.

BEAGLES.—1st, Geo. H. Hill's Banker; 2d, L. Bierstadt's Bob. Very high com., Geo. H. Hill's Gus. High com., M. Rigger's Lill.

DACHSHUNDE.—1st, Geo. H. Hill's Wallis; 2d, J. E. Estep's Rupel.

COLLIES.—*Dogs:* 1st, J. H. Mullin's Rob Roy II. *Bitches:* 1st, Geo. H. Hill's Elswica.

FOX-TERRIERS.—1st, T. D. Powell's Boxer.

BULL-TERRIERS.—*Dogs:* 1st, B. F. Lewis' Count; 2d, A. E. Pitts' Doc. Very high com., Dr. Wm. Aspinwall's Jim. High com., W. M. Brown's Dan. *Bitches:* 1st, B. F. Lewis's Countess; 2d, withheld. Com., J. O. Gilbert's Baby.

SKYE TERRIERS.—1st, F. Talmage's Muggs; 2d, C. Kirk's Dude.

YORKSHIRE TERRIERS.—1st, Frank Horn's Pansy.

IRISH TERRIERS.—1st and 2d, J. Metz's Rowdy and Dodger.

SCOTCH TERRIERS.—1st and 2d, J. Bartholomew's Tiny and Jip.

BEDLINGTON TERRIERS.—1st, B. F. Lewis' Patsy; 2d, Geo. H. Hill's Lad.

BLACK AND TAN TERRIERS.—1st, Wm. Bott's Kid.

BULLDOGS—1st, J. Dotter's Bob; 2d, C. H. Stimpson's unnamed.

PUGS.—1st and 2d, B. F. Lewis's Othello, and unnamed.

KING CHARLES.—1st, B. F. Lewis's Little Bangs.

BLENHEIMS.—1st, B. F. Lewis's Lady.

SPECIAL PRIZES.

Largest and best collection, Geo. H. Hill; 2d, B. F. Lewis.

There are many more specials, but things are so mixed up that it is impossible to give the details until matters are straightened out. WILL. F. KUELL, Sup't.

A. K. R.

BELOW are given the numbers and owners' names of the 103 dogs entered in the January number of the *American Kennel Register:*

BEAGLES.

4503. Bonny, Chas. E. Johnson. 4504. Racer, A. C. Krueger.

BULLDOGS.

4505. Christabel, Edw. S. Porter.

COLLIES.

4506. Bessie II., Curtis Holgate.
4507. Bessie III., Dr. H. T. Dillard
4508. Bruce V., A. T. Sprague.
4509. Clare Ripon, J. H. Wilson.
4510. Clifton Nero, S. A. Fisher.
4511. Clyde III., C. P. Mattocks.
4512. Highland Belle, G. T. Mullett.
4513. Leighton Collie, J. F. Leighton.
4514. Lochiel, Chas. McDonald.
4515. Maggie, C. P. Mattocks.
4516. Miss Clifton, S. S. Mathews.
4517. Ollie O'Shanter, S. J. Adamson.
4518. Prince, Curtis Holgate.
4519. Queen, Curtis Holgate.
4520. Queen Madge, S. A. Fisher.
4521. Rosalind II., G. A. Fletcher.
4522. Rosemary, G. A. Fletcher.
4523. Rutland Jock, G. A. Fletcher.
4524. Shirley, J. D. Shotwell.
4525. Tip III., R. F. Burnham.
4526. Topsy II., John R. King.
4527. Trixy, Crosby Manig Co.
4528. Wild Rose, G. A. Fletcher.
4529. Yarrow IV., C. P. Mattocks.

DEERHOUNDS.

4530. Bras, J. E. Thayer. 4532. Perth, J. E. Thayer.
4531. Mercia, J. E. Thayer. 4533. Rob Roy, C. H. Cobb.

GREAT DANES.

4534. Bella II., A. Zimmerman. 4535. Sultan, L. Wichtendahl.

GREYHOUNDS.

4536. Sybell, F. S. Peer.

MASTIFFS.

4537. Ashmont Cromwell, A. J. Pierce.
4538. Beech Grove Annie, R. C. Pate.
4539. Beech Grove Delphine, G. S. Hutchinson.
4540. Beech Grove Norah, A. M. Carr.
4541. Beech Grove Princess, M. B. Danley.
4542. Brenda III., B. W. King.
4543. Hector III., C. P. Williams.
4544. Ilford Queen, W. E. Ramsay.
4545. Leo II., G. G. Stephenson.

POINTERS.

4546. Bangle II., C. Thompson.
4547. Bang Up II., H. W. Hopkins.
4548. Bob, Chas. E. Collin.
4549. Daisey Bang, H. W. Hopkins.
4550. Dart, J. W. M. Cardeza.
4551. Fanny Bang, H. Strong.
4552. Lady Bang II., A. Winter.
4553. Max Bang, A. H. Mason.
4554. Mortimer, B. Schurmeier.
4555. Ned II., E. F. Collin.
4556. Nick o' Time, F. H. Hatch.
4557. Patsey Bang, N. McAfee.
4558. Peggy, H. W. Hopkins.
4559. Peggy Bang, T. B. Simkins.
4560. Rip Bang, H. W. Hopkins.
4561. Zip, W. F. Britain.

ST. BERNARDS—ROUGH-COATED.

4562. Clyde, J. Marshall. 4564. Prince LeRoy, C. Vreeland.
4563. Mona II., Mrs. A. Reuter. 4565. Tantallon, J. Marshall.

SETTERS—ENGLISH SETTERS.

4566. Countess Zola, F. Pitzer.
4567. Joe, Edward Brook.
4568. Pearl Benton, W. C. Augur.
4569. Tobey's Choice, A. Reimann.
4570. Twinkle, Wm. H. C. Pike.

IRISH SETTERS.

4571. Blarney W., F. B. Williams.
4572. Brush, Geo. H. Dean, jr.
4573. Dash III., Geo. R. Wilcox.
4574. Dick II., N. J. Peaslee.
4575. Dim, T. McNeill.
4576. Glen, O. S. Anthony.
4577. Jimmie Blaine, John M. Chalfant.
4578. Kerry, Edwin F. Bishop.
4579. Lula III., L. K. Mullin.
4580. Rose II., Henry O'Brien.

SPANIELS—FIELD AND COCKER SPANIELS.

4581. Barney Brant, C. F. Hately.
4582. Bonny Brant, C. M. Nelles.
4583. Dick Obo, Geo. Miller.
4584. Guy, Fred Fawkes.
4585. Hoyt's Pony, J. I. Hoyt.
4586. Jessie Brant, Miss Katherine A. Walsh.
4587. Kappa, E. G. Herendeen.
4588. Mollie, G. W. Hodgetts.
4589. Mollie Brant, Wm. McDougall.
4590. Obo V., Geo. H. Carr.
4591. Rage, G. W. Hodgetts.
4592. Ranger, W. J. Furness.
4593. Risa, J. F. Paxton.
4594. Zita, Lowell H. Boardman.

TERRIERS.—BULL-TERRIERS.

4595. Snow II., M. Donovan.

FOX-TERRIERS.

4596. Lady Mixture, J. E. Thayer.
4597. Oxford Belle, R. S. Ryan.
4598. Raby Mixer, J. E. Thayer.
4599. Surrey Sweep, Surrey Kennels.
4600. Surrey Sue, Surrey Kennels.
4601. Surrey Spice, Surrey Kennels.
4602. Surrey Spruce, Surrey Kennels.

IRISH TERRIERS.

4603. Barney, W. T. Reynolds.

SCOTCH TERRIERS.

4604. Dixie, J. J. Nussbaumer. 4605. Wrenny, J. J. Nussbaumer.
4606. Zip, J. J. Nussbaumer.

A LARGE ST. BERNARD PUPPY.—Newburyport, Jan. 15.—Having read in your issue of Jan. 13 a notice of a St. Bernard puppy ten months old, and thinking my puppy to be very large of his age, would like to know if any one has a larger one of the same age. I send his measurements. Erlking (A.K.R. 4423), whelped July 4, 1886, weighs 88lbs., standing 29in. at shoulders and measuring 67in. from nose to tip of tail. His head is 22in. round the skull, muzzle 14in. and his chest girths 33in. His forearm measures 17in., and above the first joint it is 10½in.—CHAS. WILLS.

DOG AND GAME PROTECTION SOCIETY.—At a meeting held in Baltimore, Md., Jan. 13, an association was formed for the purpose of prosecuting violations of the game laws and cases of dog theft. Following is a list of the officers: President, Dr. B. W. Smith; Secretary, R. D. Coe; Treasurer, C. S. Wertsner. Committee to draft constitution and by-laws, H. Malcolm, W. S. Diffenderffer, H. L. Clark, Dr. G. Massamore and T. H. Heintz. Committee on prosecution, W. R. Filles and J. Clark.

ACCIDENTALLY POISONED.—Harrisburg, Pa., Jan. 11.—My setter dog Prince (A.K.R. 1038) died last night of poisoning, accidentally picked up, I think. This is the second setter I lost within twelve months from same cause, Theron (A.K.R. 715) having died Jan. 14, 1886. Prince was three years old Dec. 20, 1886, and was such an excellent ruffed grouse dog that money would not have induced me to part with him. Alas! "I've seen my fondest hopes decay."—EUGENE SNYDER.

BEAGLES.—*Editor Forest and Stream:* Last winter I went hunting white hares in Massachusetts with a gentleman who had a small hound, say twelve to fifteen inches in height at the shoulder, well proportioned, with straight legs, and ears not longer in proportion to size, than are those of the English stag hound. This dog, which was the finest hound I ever hunted with, the owner claimed was a Scotch beagle, its mother having been imported from Scotland. Being desirous of obtaining a beagle of this kind I have corresponded with quite a number of dog fanciers to learn that no one with whom I have corresponded, knows of such a hound as the Scotch beagle. Now, perhaps, some of your readers may know where such a dog as I would like may be obtained. I do not care to have the long-eared, short and crooked-legged English beagle.—SUBSCRIBER. [There are undoubtedly good beagles in Scotland, but there is no breed peculiar to the country. If subscriber will correspond with some of the parties that advertise beagles in FORREST AND STREAM, he will undoubtedly find just the dog he is looking for.]

COLLIE SWEEPSTAKES.—The first semi-annual collie sweepstakes, under the auspice of the Collie Club of America, for puppies born in the United States or Canada on or after Sept. 1, 1886. Entrance $5 each, to be paid to the secretary of the Collie Club at the time of entry. The sweepstake to be decided at a show in the fall of 1887, to be selected by the executive committee of the Collie Club. The winner to receive fifty per cent. of the sweepstake; twenty-five per cent. to go to the second, fifteen per cent. to the third, and ten per cent. to the fourth. In entering dogs for the show at which it is decided to hold the collie sweepstakes, it will be necessary to enter them according to the regulation of that show, paying the entry fee and placing them in such classes as the exhibitors may choose; and also specifying on the entry blank that they are "to compete for the collie sweepstakes." Entries close May 1, 1887.—GEO. A. SMITH, Sec.-Treas.

ETHAN ALLIN SETTERS.—We have received a letter from Mr. Ethan Allin, from which it appears that we misunderstood his previous letter and stated that he had sold all of his setters with the exception of two puppies. Mr. Allin informs us that being unable to attend to the rearing and training of his dogs he has made arrangements with a competent trainer to take charge of his kennel and that as heretofore he can supply a limited number of first-class ruffed grouse dogs as well as a few puppies. This we are sure will be welcome news to a large number of gentlemen, who for many years have shot over these capital dogs.

THE LARGEST MASTIFF BITCH PUPPY.—*Editor Forest and Stream:* The weights of the mastiff puppies given last week in your journal were of dogs. I claimed the heaviest weight for a bitch pup, and now ask Mr. Allen if he can beat 106lbs. for a 7 months old bitch pup? I still claim my Alpha (A.K.R. 3921) to be the heaviest bitch pup at that age on record.—VICTOR M. HALDEMAN.

WESTERN PENNSYLVANIA POULTRY SOCIETY.—The officers of the Western Pennsylvania Poultry Society for 1887 are: President, Edward Gregg; Vice-President, Thomas Booth; Treasurer, C. A. Stephens; Secretary, C. B. Elben; Directors, B. F. Wilson, H. Hartley, W. C. Meyer, J. R. Henrichs and Charles Richardson.

COON DOGS.—New York, Jan. 10—*Editor Forest and Stream:* I would like to know how to breed a first-class coon dog. If any of your readers can inform me how to proceed they will greatly oblige.—W. C.

THE BEAGLE CLUB.—Following is a list of the officers of the American English Beagle Club, elected for 1887: President, H. F. Schellhass; Secretary and Treasurer, W. H. Ashburner; Executive Committee, Elmer E. Shaner, Andrew Winsor and W. F. Streeter.

THE GORDON SETTER LON.—*Editor Forest and Stream:* Can any of your readers give me the pedigree of the Gordon setter dog Copeland's Lon?—ALF.

KENNEL NOTES.

Notes must be sent on prepared blanks, which are furnished free on receipt of stamped and addressed envelope. Sets of 200 of any one form, bound for retaining duplicates, are sent for 30 cents.

NAMES CLAIMED.

☞ **Notes must be sent on the Prepared Blanks.**

Dick Obo. By George Miller, Jersey City, N. J., for black cocker spaniel dog, whelped March 15, 1886, by Obo II. (A.K.R. 432) out of Toronto Jet (A.K.R. 86).

Telie Doc. By D. W. Oyster, Washington, D. C., for orange and white pointer bitch, whelped May 27, 1886, by Fritz (A.K.R. 1351) out of Virginia (A.K.R. 1537). (Wrongly given as a dog last week.)

Derby Luke. By Geo. B. Talmadge, Derby, Conn., for liver and white pointer dog, whelped Nov. 27, 1886, by Goodwin's Dash (Sensation—White's Grace) out of Zoe (A.K.R. 1444).

Glenmore G. By H. Gaylord, Elmira, N. Y., for red Irish setter dog, whelped Oct. 14, 1886, by Glencho (Elcho—Noreen) out of Quail O'More (Rory O'More—Sampson's Nora).

Nora O'More. By Dr. M. Davis, Elmira, N. Y., for red Irish setter bitch, whelped Oct. 14, 1886, by Glencho (Elcho—Noreen) out of Quail O'More (Rory O'More—Sampson's Nora).

Bacchante. By A. Perrin, Cambridge, Mass., for white, black and tan markings on head, fox-terrier bitch, whelped Nov. 2, 1886, by Bacchanal (The Belgravian—Bedlamite) out of Trifle (Raby Tyrant—Judy).

Brookwood. By W. S. Brown, New York city, for orange and white English setter dog, whelped July 22, 1886, by champion Lark out of Flounce.

Lonwood. By W. E. Deane, Somerset, Mass., for white, black and tan beagle dog, whelped Aug. 30, 1886, by Flute D. (A.K.R. 2388) out of Dixie (Elmore's Flute—Thorn).

Billie M. By Thomas Callahan, Stoughton, Mass., for white, black and tan beagle dog, whelped Aug. 22, 1886, by Racer II. (Racer—Jewell) out of Jewell (Racer—Dolly).

Dix C. By Thomas Calahan, Stoughton, Mass., for white, black and tan beagle dog, whelped Aug. 20, 1886, by Flute D. (A.K.R. 2388) out of Dixie (Elmore's Flute—Thorn).

Pansey D. By W. T. Deane, Somerset, Mass., for white, black and tan beagle bitch, whelped Aug. 20, 1886, by Flute D. (A.K.R. 2388) out of Dixie (Elmore's Flute—Thorn).

Lady May. By Robert Bradley, Waynesburg, Pa., for red Irish setter bitch, whelped May 4, 1886, by Barney O'Shea (Rory O'More—Norah O'More) out of Red Rose (champion Biz—Lady Clare).

BRED.

☞ **Notes must be sent on the Prepared Blanks.**

Victoria Lavcrack—Gun. Charles York's (Bangor, Me.) pure Laverack bitch Victoria Laverack (Tempest—Lilly) to his Gun (Gladstone—May B.), Jan. 12.

Dora Royal—Paul Gladstone. F. I. Stone's English setter bitch Dora Royal to Memphis & Avent Kennels' Paul Gladstone (Gladstone—Lavalette), Dec. 16.

Louise—Paul Gladstone. Thos. Greagery's English setter bitch Louise to Memphis & Avent Kennels' Paul Gladstone (Gladstone—Lavalette), Dec. 13.

Juno—Royal Duke. J. G. Blossom's Gordon setter bitch Juno (Glen—Flirt) to E. Maher's Royal Duke (Bob—Nell), Jan. 5.

Lorna—Elcho, Jr. Dr. Wm. Jarvis's (Claremont, N. H.) Irish setter bitch Lorna (A.K.R. 246) to his Elcho, Jr. (A.K.R. 568), Nov. 28.

Ruby—Elcho, Jr. W. G. Simon's (Manchester, N. H.) Irish setter bitch Ruby to Dr. Wm. Jarvis's Elcho, Jr. (A.K.R. 568), Dec 17.

Bess—Sarsfield. G. H. Parkinson's (Middletown, Conn.) Irish setter bitch Bess to Dr. Wm. Jarvis's Sarsfield, Dec. 14.

Juno—Royal Duke. James B. Blossom's (Morrisania, N. Y.) Gordon setter bitch Juno (Aten's Glen—Francis's Flirt) to Edward Maher's Royal Duke (Bob—Nell), Jan. 5.

Cute—Pap Smizer. L. Gardner's (Mt. Vernon, N. Y.) pointer bitch Cute (A.K.R. 2682) to Dayton Kennel Club's Pap Smizer (Meteor—Diana), Jan. 8.

White Pink—Baronet. John Forrest's (Randolph) bull-terrier bitch White Pink (A.K.R. 4487) to A. Perrin's Baronet (A.K.R. 4480), Dec. 2 and 4.

Victoria Lavcrack—Gun. Charles York's (Bangor, Me.) pure Laverack bitch Victoria Laverack (Tempest—Lilly) to his Gun (Gladstone—May B.), Jan. 11.

Cushlar—Gerald. Wm. Scofield's (Bridgeport, Conn.) Irish red setter bitch Cushlar (Elcho—Firefly) to F. S. Parrott's Gerald (Glencho—Zelda), Jan. 10.

Linda—Duke of Leeds. C. H. Springs's (Newton, Lower Falls, Mass.) St. Bernard bitch Linda (A.K.R. 2532) to E. R. Hearn's Duke of Leeds (A.K.R. 1535), Jan. 13.

Kate VIII.—Bang Bang. Westminster Kennel Club's (Babylon, L. I.) pointer bitch Kate VIII. (Donald II.—Bell) to their Bang Bang (A.K.R. 894), Dec. 8.

Countess—Bang Bang. Westminster Kennel Club's (Babylon, L. I.) pointer bitch Countess to their Bang Bang (A.K.R. 894), Dec. 12.

Red Flash—Sarsfield. H. B. Draper's (Catskill, N. Y.) Irish setter bitch Red Flash to Dr. Wm. Jarvis's Sarsfield, Dec. 25.

Noreen—Champion Elcho. Dr. Wm. Jarvis's (Claremont, N. H.) Irish setter bitch Noreen (A.K.R. 297) to his champion Elcho (A.K.R. 295), Dec. 27.

Nana—Cicero. Essex Kennels' (Andover, Mass.) pug bitch Nana (Sam—Titania) to their Cicero (A.K.R. 424), Jan. 12.

Dido II.—Duke of Leeds. John S. Sheppard's (New York) rough-coated St. Bernard Dido II. (Barry—Dido) to E. R. Hearn's Duke of Leeds (A.K.R. 1535), Jan. 13.

Meersbrook Model II.—Ruby Jack. Hillside Kennels' (Lancaster, Mass.) fox-terrier bitch Meersbrook Model II. (A.K.R. 4108) to their Ruby Jack (A.K.R. 3808), Nov. 30.

Di—Mixture. Hillside Kennels' (Lancaster, Mass.) fox-terrier bitch Di (Raby Tyrant—Richmond Olive) to their Mixture (A.K.R. 2697), Dec. 4.

RANGE AND GALLERY.

THE BULLARD MATCH.

THE first match instituted by the Bullard Repeating Arms Co. thrown open to rifle clubs of this country and Canada, was fired during the last week, and the full returns transmitted by the donors of the prize shows that the contest was a close one and that the honors, which fell to the veterans of the Walnut Hill range, are worthily won.

SPRINGFIELD, Mass., Jan. 22.—*Editor Forest and Stream:* We send you herewith the scores made by the various competing rifle clubs and military companies in our match No. 1, the prize being one of our best repeating rifles with all our recent improvements. As will be seen by the scores the Massachusetts Rifle Association won with a score of 765 points, the Gardner following closely behind; the score of the Gardner Club as given shows 768 points. We are informed that the last shot, a 6 made by Mr. Hinds, was shot on the wrong target, consequently under the rules cannot be allowed. This unfortunate shot loses the match for the Gardner Club. There are several competitors who evidently did not understand the target used, for no counts appear lower than fours. The Creedmoor target is used for a back to the smaller targets and the counts lower than four count as on Creedmoor target.—BULLARD REPEATING ARMS CO.

Practice Score.

A C White	8	9	8	9	10	5	8	6

ST. CATHARINE, Ont., Jan. 22.—The annual shoot of the Welland County Sportsman's Association, has just closed after a three days' session. The weather was very much against large scores. The first day, the 19th, a very strong wind was blowing from the left rear and very cold, but the live birds, on the whole, were a very good lot. The Niagara Falls blackbird was also tried for the first time here, and was very satisfactory. The visitors gave them great praise for the good flight they made in the heavy wind, and the home shooters found them as hard to get on to as the live bird. Quite a number of shooters from New York State were present, among them being Mr. Ed. Hudson, of Syracuse, N. Y., who did some very fine scoring. Match No. 1—12 live pigeons, gun below elbow, 1¼ shot, H. & T. ground traps, 26yds. rise, 80yds. boundary, shot under Dominion rules, 6 prizes:

C Forsyth	111101111111—11	W Stroud	111101111011—10
T S Clark	111111111110—11	Ed Hudson	010111111111—10
J E Stroud	111111101111—11	Beldan	111111001111—10

Thirty-eight contestants retired after missing 3 birds each. In shooting off ties Forsyth won first, J. C. Stroud second, Clark third. Ties on 10 divided fourth, fifth and sixth prizes.

Match No. 2.—9 Niagara Falls blackbirds, 18yds. rise, National rules, 3 prizes:

Clarke	001111111—7	Adams	010111011—6
Neff	010011110—5	Lansing	111101010—6
Harrison	001111000—4	Reade	111000100—4
Felstead	110110111—7	Smith	010001101—4

First and second divided.

Match No. 3.—9 Niagara Falls blackbirds, 3 traps, 18yds. rise:

McArthur	100010011—4	Harrison	110110111—7
Dyer	100101110—5	Hudson	111111111—9
W Stroud	110111111—8	Clarke	111110110—7
J Stroud	100101010—4	Adams	111111111—9
Neff	010110110—5	Felstead	111101111—8

Hudson first, Felstead second, Clark third.

Match No. 4—9 Niagara Fall blackbirds, 3 traps, 18yds. rise, 2 prizes:

Adams J	110001111—6	McArthur	011001110—4
Lansing	001001101—4	Hudson	111111110—8
Clark T	111110101—7	W Stroud	111011100—6
Felstead	111110111—8		

First divided, Clark second.

Match No. 5—Niagara Falls blackbirds, 3 traps, 18yds. rise, 2 prizes:

T Clark	111111101—8	Adams	101111111—8
Ed Hudson	111111101—8	McArthur	001001101—4
Felstead	011101101—6		

First divided.

Match No. 6—9 Niagara Falls blackbirds, 3 traps, 18yds. rise:

H Graham	010001011—4	Neff	011110110—4
T Clarke	101111001—6	Hudson	111111111—9
McArthur	110101101—5	Adams	110110011—6
Felstead	111111101—8	George	111011110—7

Match No. 7—18 blackbirds, 2 prizes:

George	101111111—8	Rogers	010101011—5
Koch	110111101—7		

Adams first, Hudson and George second, Clark third.

Match No. 9.—9 Niagara Falls blackbirds, 3 traps, 15yds. rise, 3 prizes:

Koch	101111011—7	Schwarz	000101101—4
Clarke	010110011—5	Gibson	010100111—5
Adams	111000101—5	Talsma	111110011—7
Hudson	011111111—8	Neff	011100110—5
McArty	101000101—4	Wayper	111110100—6
Felstead	011100001—4		

Hudson first, second divided, Wayper third.

Match No. 10—3 Niagara Falls blackbirds, 3 traps, 18yds. rise, 3 prizes:

Koch	111111111—9	Talsma	110111101—7
Wayper	110110011—6	Clarke	111101110—7
Neff	111100101—6	McArthur	010101000—2
Hudson	111111110—8	George	010111001—5
Felstead	101011110—6		

Koch first, Hudson second, Talsma and Clarke third.

Match No. 11—9 blackbirds, 18yds. rise, 2 prizes:

Koch	111111101—8	Clark	111100010—5
Talsma	010111101—6	Wayper	000100[illegible]
Harrison	010001101—4	G Rogers	111101100—6
Felstead	010011001—4		

Koch first, Rogers and Talsma second.

Match No. 12—McArthur challenged Clark to shoot at 12 blackbirds for $25 a side, 18yds, 3 traps:

Clark	111100011101—7
McArthur	111110010001—7

In shoot off Clark won. Another match was arranged between these gentlemen at live birds to take place at Buffalo for $50 a side on Jan. 26.

KINGSTON-MIDDLESEX.—Kingston, N. J., Jan. 19.—The return match between the Middlesex Gun Club and the Kingston Gun Club, at clay-pigeons, 5 traps, 18yds. rise, was shot here this afternoon. The wind and cold made it anything but a desirable day to shoot or make a good score:

Kingston.		Middlesex.	
C McDonald	000001110010011— 5	Wyckoff	110011100110110— 9

	76		66

In the morning two sweepstakes at live birds were shot, the first with 12 entries: C. Sampson first, C. Houstan second, Williamson and Smith divided third. The second sweepstake had 16 entries: Sampson and Dickins divided first, Houstan second, Fox and Fouler divided third.

BROOKLYN, Jan. 19.—The Washington Gun Club held their first regular shoot of the season at Dexter's Park, L. I., to-day, for a gold badge and money prizes. Out of 98 birds shot at 68 were killed and 30 escaped. The score is as follows:

J Newton, 25yds	1111110—6	E Gateson, 21yds	1001011—4
A DeGraw, 25yds	1111111—7	J Moller, 21yds	0100010—2
A Rockfeller, 25yds	1101110—4	F Feldhus, 25yds	1111111—7
J Boling, 25yds	1011101—5	J Smith, 25yds	1111111—7
C Rockfeller, 23yds	1110111—6	R Jones, 23yds	0011111—5
A Altenbrand, 21yds	1111000—4	D Morgan, 23yds	1110110—5
C H Smith, 23yds	0011011—4	H Winants, 23yds	0101011—4

Ties divided.

TORONTO, Jan 17.—Some of the members of the St. Thomas Gun Club favor the use of the English sparrows instead of pigeons as targets at the shoots of the club. The quarrelsome, dirty, noisy, and destructive little sparrows, they claim, are of no earthly good and no better use could be found for them than for trap-shooting. Those favorable to the change contend that there are plenty of reasons good and sufficient for such a course. In the first place the flight of the birds is such as would make them very good marks and then another good feature is the readiness with which they may be trapped. Trap-shooting my be called a sin, but charity covereth a multitude of such, and even in trap shooting there is a charity—in ridding the country of such a bird. Our advice to the club is to go ahead and try them, as they would undoubtedly make first-class marks and a pleasing change from the targets generally in use.—*St. Thomas Times.* The attention of local gun clubs is directed to our contemporary's remarks. Sparrow pie does no go amiss occasionally.—*Toronto Mail.*

Jan. 20.—A blackbird shoot took place at John Oulcott's, Eglinton, to-day. Five sweepstake matches were shot during the afternoon. There were two prizes in each. Following is the score:

First sweep, at 9 birds, 18yds. rise—W. McDowall 6, G. Carruthers 5, C. Duncan 4, J. Baillie 3, T. Loudon 2.

Second sweep, same terms—G. Carruthers 7, C. Duncan 6, F. Loudon 5, W. McDowall 5, J. Baillie 4.

Third sweep, same terms—C. Duncan 7, T. Loudon 6, G. Carruthers 5, T. Baillie 4, W. McDowall 3.

Fourth sweep, 6 birds, 18 yds. rise—T. Loudon 5, W. McDowall 5, G. Carruthers 4, T. Baillie 3, C. Duncan 3. In shooting off Loudon hit three straight and took first prize, McDowall hitting two out of three.

Fifth sweep, 6 birds, 18yds. rise—G. Carruthers 6, W. McDowall 4, T. Baillie 4, C. Duncan 3. In shooting off ties for second prize McDowall won with 2 out of 3, Baillie only hitting 1.

HOUSEBOATS AND HOUSEBOATING.

As the winter passed there was evinced a deep concern as to what the club should do in the . . . . summer; . . . . and various were the schemes proposed. . . . . Water entered largely into all the projects that were advanced, with a marked reservation . . . . in favor of the calmer variety. . . . . Finally one evening the Owl sat down in his place, with an expression on his countenance indicative of the agreeable possession of an idea; and . . . . said:

"Boys, I know what we'll do next summer."

"You do!" said the club; "out with it."

"We'll hire a canal boat." . . . . .

The Owl proceeded to unfold his plan; and after the first blush of insanity had faded away from it, the club became deeply impressed with its practicability and attractiveness. . . . . .

At last fortune smiled upon them . . . . they found in the dock a new and neat-looking boat. . . . . A bluff, hearty and well-favored navigator came up . . . . from the cabin. The boat was new, he said . . . . and he finally consented to charter . . . . at seven dollars a day.

The next day all was bustle and activity. . . . . A new coat of paint was being put upon her deck, and Rossil . . . . had his wagons going all day, collecting bric-a-brac, canvases, easels, draperies, cushions, palettes, portfolios, and all manner of effects, domestic and personal. . . . . A colored gentleman of a culinary turn named Daniel . . . . was promptly commissioned to buy a large stove and all the necessary utensils of his craft. . . . . He came down to the boat with five tons of ice, a big refrigerator, a small cooking range, about one hundred paper parcels, 200lbs. of fresh beef and mutton neatly sewed up in bags to go inside the ice house, quantities of vegetables and two coops full of . . . . . chickens.

Daniel made a splendid impression. He . . . . saluted each one with an obeisance . . . . looked upon the wealth of color and rich trappings without betraying the faintest trace of the plebeian emotion of surprise . . . . and . . . . betook him to arranging his kitchen and putting away his various stores. His kitchen inspired confidence, and his appearance in snowy linen cap and jacket and long white apron was most reassuring.

The Committe on Decoration and Home Comforts covered itself with glory. With unlimited bric-a-brac and tapestry, and stuffs oriental and domestic at its disposal, the interior . . . . underwent a surprising transformation. If it erred at all it was in the direction of positive luxury, but the artistic and decorative effect that was produced was excellent. To those who looked at it . . . . from the point of view of having to dwell in it . . . . it was particularly grateful. The divans that were easily translated into beds; the cushions, that were but pretexts for the diurnal concealment of pillows; the piano, the violins, the big dining table, the smokers and hammocks, the neat pile of fresh tablecloths and napkins, the excellent glassware in the sideboard, the decency of the cutlery, the neat student-lamps and Chinese lanterns, and a certain grace in the profusion, and a quality of ease in the general disposition, were extremely alluring.

The day of departure . . . . The last valise was on board . . . . it was evening . . . . a small parasite of a tugboat . . . . towed her to the comparative privacy of the outer river. Great apprehension had been felt that the cabin would be insufferably hot, but . . . . a delicious draft of cool air entered at the forward hatch and swept through the room from end to end, producing a most agreeable temperature. Hot as the weather subsequently was, the cabin was always pleasant, and upon no evening . . . . . was it desirable to sleep without more or less covering or without partially closing the inches. . . . . The city crept slowly by, darkness descended on the scene, the lights on the shore came out one by one, and everybody went below.

. . . . . Daniel . . . . laid the table . . . . and . . . . brought on a most fragrant repast. . . . . There were porterhouse steaks done to a turn, devilled kidneys, cold roast beef, roast potatoes, hot biscuits, fried chicken (after the fashion of Daniel's native Baltimore), tea, coffee, and the club's regular b—everage. . . . . In the conversational pause that ensued, the consumption that took place was little short of marvelous . . . . the faculty of speech began to be restored . . . . and the members reclined in their armchairs and sent long wreaths of smoke out of the hatches.

. . . . . Later . . . . there was music. . . . . It was after midnight when the pipes and lamps went out by common consent, and the club retired in great comfort.

. . . . . and . . . . the gray mist had stolen down between the hills . . . . and hung low upon the river. Nothing was visible around but the still water melting into the soft cloud, and nothing was to be heard but the gentle ripple of the eddying current.

—*The Tile Club Afloat.*

The fascinating story, from which the foregoing has been culled, of the primitive houseboating (for such it really was) of the Tile Club, might well inspire the reader with a desire to share in similar enjoyments. Not that there is anything particularly new in a houseboat, for from the time of the first one of which we have any record, in which Captain Noah must have found it a task of no ordinary difficulty to provide for and provision his varied crew, these fashionable dwellings have in one form or another subserved purposes of utility and pleasure in all ages and nearly all maritime countries.

With the mere utilitarian houseboat this paper has little to do, but the reader who has resided in China will readily call to mind the sights and sounds of its floating population, the thousands who live and move and have their being in apparent happiness, and more or less of comfort on board junks, which are not only houseboats in the broadest meaning of the word, but which in many instances, in their size, and in the nature of their uses, aspire to the dignity of emporiums.

In this country the houseboat is almost unknown, but a rude form, which might more properly be termed a "houseraft," has already had its uses as a safe retreat and a defense, when in the early days the marauding Indian would have annihilated the encroaching paleface, and the early settler drove his plow afield with a musket in the hollow of his arm. On the foundation which these rude forestalkers so firmly laid has been built a civilization which has brought with it new desires, motives, aims and methods as well as conveniences and enjoyments to which we are so accustomed that we have come to regard them as necessities.

In England the houseboat is of the latter class, and has of late years multiplied so rapidly that its genus can now be met with snugly moored against the banks of nearly every picturesque lake and navigable river, or swinging to an anchor in quiet coves and cozy inlets of the sea wherever a sheltered harbor and pleasant surroundings can be found.

But the pleasure and luxury of life on a houseboat, its freedom, comfort and healthfulness, and its immunity from the host of cares and annoyances which beset the summer cottage owner, or hotel boarder on shore, are not yet thoroughly appreciated or even understood in this country. Occasionally a returned traveller from England brings with him the story of a brief sojourn on one of these pleasant floating dwellings, and treats his hearers to an enticing description of the morning plunge into the sparkling waters, the sun bath on the upper deck, the keen appetite and the tempting breakfast, with the summer breeze playing through the cabin windows; the morning smoke under the deck awning, the row in the launch up the river, the lunch at the neighbors in the next houseboat, the return with the tide and the ladies at the oars, the perfect cooking of the dinner which awaited them, the enjoyments of the musical evening which wound up the pleasures of the day, and the deep and dreamless slumber in the luxurious stateroom preparatory to kindred enjoyments on the morrow.

In his eager rush from place to place, the Europe-trotting American does not, as a rule, see much of all this; but occasionally one more fortunate or wiser than his fellows comes back with a story like the above, and puzzles his hearers with the query: "Why has no the houseboat been introduced into this country?"

The houseboat, as its name implies, is a house and a boat in one. Like other houses and other boats, it is costly or otherwise according to its size and fitting and the means and desires of its owner. For a few hundred dollars a single man who finds pleasure in "roughing it" can own a houseboat, in which he can compass his simple enjoyments in a thoroughly satisfactory way. Add to the above figures until they become say a couple of thousands, and a houseboat can be produced in which a gentleman and wife will find in saloon, stateroom, bath room and domestic conveniences, completeness and even luxury, which cannot be duplicated for twice that expenditure on shore; while to the fortunate few who can contemplate the addition of yet another cypher, can be insured a floating palace with which, for its purposes, no yacht at three times the cost can compare.

Though comparatively costly in the first building, for it would be unwise to construct it in any but the best manner, the houseboat has many features of economy which are denied the summer dweller on *terra firma*. No costly lot of land has to be bought to build it on, and the maintenance of fences, walls, lawns, terraces, fruit, flower and kitchen gardens do not figure on the expense account. In domestic management the houseboat is freed from the wasteful tyranny of the Bridgets. The peaceful serenity of the houseboat mistress is not disturbed by any questions involving the issue of "Sundays out" or the desirability or otherwise of Bridget's "young man," for all the work on board is usually done by men, and from stemhead to rudderpost the genus Bridget has no necessary place.

In small houseboats, one man to act in the role of cook, steward and general utility is sufficient. A larger boat may make advisable the addition of a boy to wait at table and "help round," but even in the family houseboat of say four staterooms besides the saloon and domestic offices, two good men will not only do the work with ease, but it not kept too busy with the tender to and from the shore, will find lots of idle time upon their hands.

In furnishing the houseboat, the expenditure necessary for furnishing an equivalent house on shore need not be exceeded, and in "running" the houseboat the same rule will apply. Perhaps the last remark is not sufficiently strong, for in point of fact, the intelligent service of the men on board, as against the almost invariable incompetence of hired "summer help" on shore, will, in the majority of cases, show a marked advantage in favor of the purse and temper of the houseboater.

One of the pleasantest of the larger English houseboats is owned by a retired East India merchant, and has, or had, for its crew, three coolies. One is monarch of the kitchen, another looks after the "below deck" and the third is responsible for the "on deck" arrangements from entry port to signal halliards. This boat lies moored stem and stern so close to a bold bank in a lovely river that a swinging drawbridge reaches from entry-port to shore.

In another case of which the writer has very pleasant memories, a family houseboat with three staterooms, the service is most excellently rendered by a man and his wife, old and trusty servitors of the family. Here the man performed all on deck duties, while the wife, with her husband's occasional assistance, took charge of the kitchen and entire "indoors," and made this houseboat lays to an anchorage under the lee of a small island some little distance from the shore, a steam launch is added to the man's responsibilities.

Another houseboat, one of the smaller kind, has for its occupants and owners, two clerks, than whom no more enthusiastic houseboaters can be found. A convenient inn on the river bank furnishes their meals and guards their property while during the day they are attending to their business in London, and as these clerks (who are, by the way, very jolly and exceedingly hospitable fellows) attend to their own bed making, dusting, and other domestic duties, they avoid the expense of hired help and live a life of exceeding independence and enjoyment. In their case economy and contentment evidently go hand in hand.

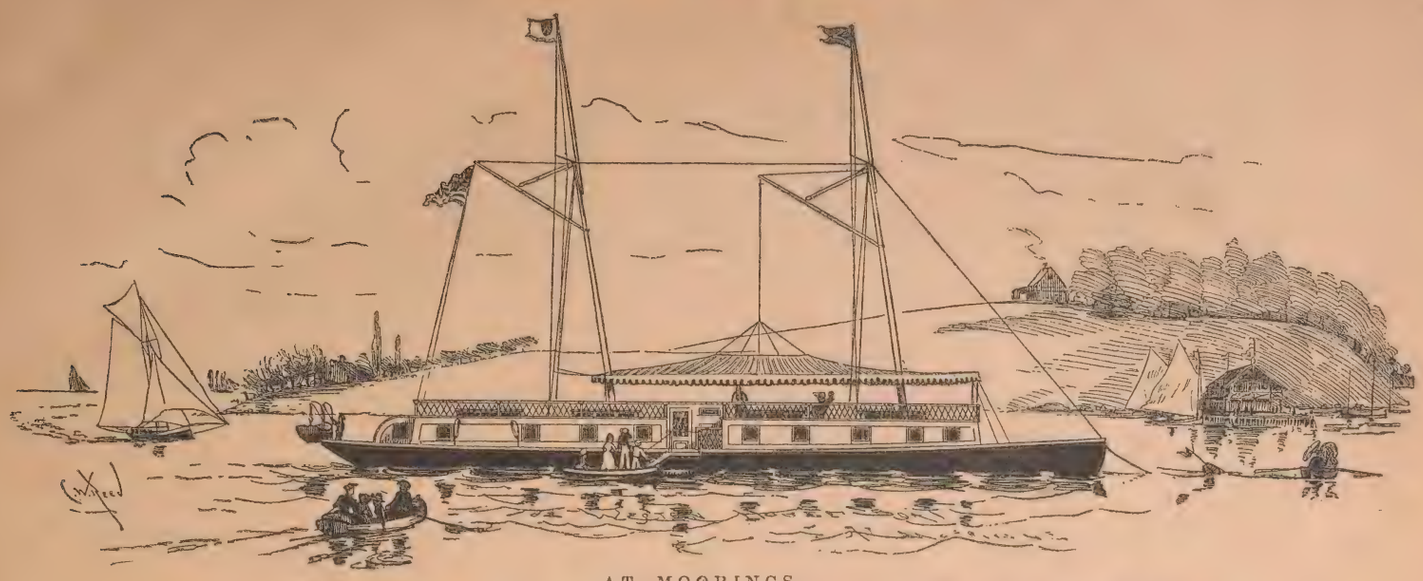
But even houseboats though always economical in the sense that small expenditure gives comparatively large returns) can be conducted in a costly manner. The writer calls to mind one case, a large and exquisitely appointed vessel which usually summers (or used to) in the romantic regions of the North of Scotland, to which a domestic staff of eight adults and eight boys is attached. The business of the boys is to look as pretty as possible in their natty man-o'-war uniforms, and to row the owner, his family and his guests from place to place in the handsome eight-oared galley in which all such excursions are made. When the boys are not at this duty, an admirable course of study employs their minds and fits them for the more serious duties of the life before them. The boys themselves are selected from the street waifs of Edinboro, Glasgow and other cities, and the wise extravagance of their employer may, and probably will, save eight souls from prison or worse. With such a numerous retinue, a servant's houseboat is a necessity, and one is in this instance moored well out of earshot of the other, at night the servants, save one man on watch, withdraw to their own boat, where ample sleeping accommodations are found, and where the large cabin used by the boys as a school room gives them facilities for the social evening which ordinarily winds up the pleasant duties of the day, for one of the unwritten laws of houseboating is that everywhere, above and below deck, in the saloon or in the servant's quarters, at all times and under all circumstances, Happiness, with a big H, shall reign.

It would not be surprising if, to the minds of those who may be here gathering their first information on the subject, comparisons between houseboats and yachts may at present present themselves, but the truth is, no such comparisons can fairly be instituted. As a houseboat the yacht is of necessity both incomplete and unsatisfactory; while as a yacht, the houseboat proper has really no claims to consideration at all. The desire or the need for the one cannot possibly be satisfied by the possession of the other, and although the enjoyments pertaining to each are of close relationship, that very fact establishes an *entente cordiale* and emphasizes the absence of any competition as to merit or desirability.

The majority of yachtsmen find their chief pleasure in sailing, in moving their craft from place to place by the agency of wind or steam, and more especially of the former. Of these an influential majority of even vessels of sufficient size to "keep the sea," to cruise from port to port and to risk the chances of wind and weather. On board such vessels the spaciousness and completeness of the below deck accommodations and the convenience of the appointments enable one to live and reside with considerable comfort.

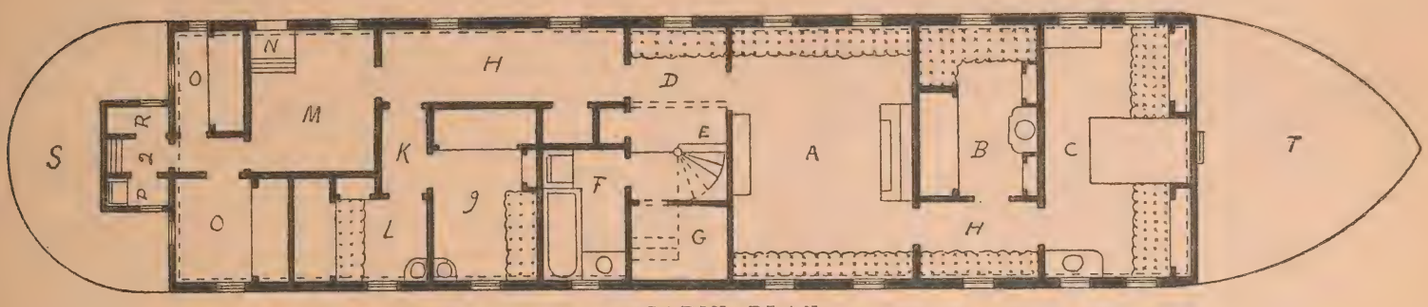
But even on the largest yachts, the "domestic," so to speak, arrangements are not of a nature which admit of such craft being devoted to family uses for any extended periods without considerable discomfort of a certain kind and some inconvenience. On small sailing craft, the designs for which ought not to be influenced by any considerations whatever, save those of speed and safety, the sacrifice of the former probably and of the latter most certainly, must always attend an endeavor to combine small tonnage, great speed and disproportionate below deck accommodations. Yet strangely enough the endeavor almost invariably continues to be made, and a craft as unsafe as it is uncomfortable, and therefore wholly unsuited to family yachting, is the result.

From this it naturally follows that yachting is mainly restricted to the sterner sex, and the married yachtsman is compelled to consent to temporarily "shelving" his family ties, duties and pleasures, or else has to forego enjoyments in which those who are nearest and dearest to him cannot conveniently share.



To the married man then, the man with a family, the institution of the modern houseboat should surely commend itself. It literally bristles with good qualities which appeal to him most strongly. In its perfect safety the fond mother and father are relieved of anxieties which on other pleasure craft often take the keen edge from their enjoyment. Its roomy and well-fenced deck affords ample and secure playground for the children, where they can indulge unrestrictedly in the healthful use of limbs and lungs in the open air, and at the same time be assured the most absolute immunity from undesirable associations. As a house it can be in every way as complete and convenient as a dwelling on shore, and in some respects (no fatiguing stairs for instance) it can be even superior; while as a boat, not even the largest yacht—when at anchor—can be considered in any particular a more satisfactory abode.

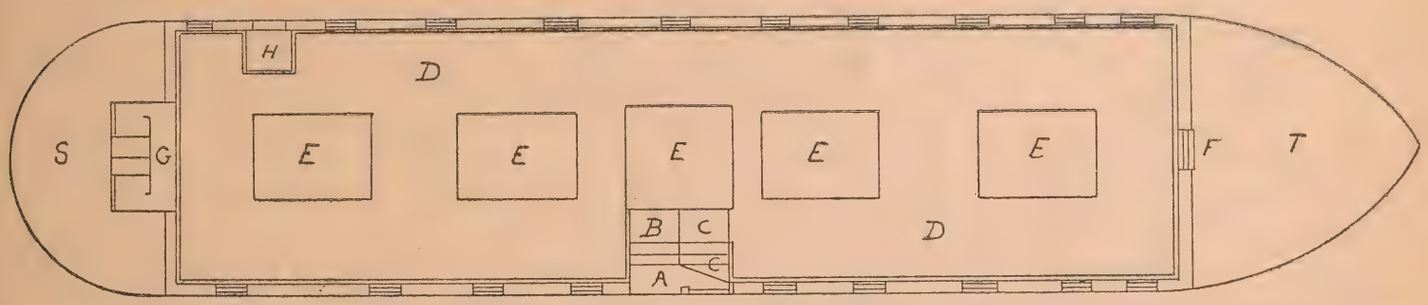
The houseboat has many features peculiar to itself and not shared by other pleasure craft. One of these is its inability to move from place to place without outside assistance. To some this might appear in the light of a deprivation, but by the genuine houseboater it is regarded as a privilege. And such indeed it is, for stability of location and well as stability of model all go to add to the enjoyable features of the "house" part of your craft without detracting from those of the "boat." The ability to change the location of your house when it is desirable to do so, and the lack of temptation to do so unless it is desirable, are items which have a very direct bearing on your comfort and enjoyment. Your naval architect, free from all problems involving centers of effort or sail-carrying power, has given you a form of hull in which great initial stability and prodigality of cubical contents have been most successfully combined. And your interior architect, taking up the thread where his brother dropped it, has so divided, apportioned and decorated the space at his command, that it has become in arrangement a very marvel of convenience, and in design and adornment a realization of beauty in a way which would not have been possible had the exigencies of boiler space or other means of self propulsion entered into the calculations.



And the moving of the houseboat is not, after all, a matter of much difficulty. A skilful utilization of wind and tide and the assistance of a couple of men in a rowboat are often all that are necessary, except when great distances or too swiftly opposing currents have to be traversed, and in such cases the ubiquitous towboat will take your hawser and bear you with rapid ease to your destination at an expense which, comparatively speaking, may be termed trivial.

But, it may be urged, to live on a boat and not be able to sail, would be as incomplete as to live on shore and not be able to ride or drive. Before arriving at any such hasty conclusion there are many things which should be taken into consideration. At the worst (if such a conclusion has to be admitted at all) it is only a question of compensating advantages, and no houseboater will for a moment allow there is opportunity on that point for argument. You cannot but concede that, were you living on shore, you would not take your house for a ride or drive, but you would order your horse or your carriage. So, on the water, you do not take your houseboat for an outing, but if you wish to row you take one of your tenders. Should the breeze be propitious and sailing be

A WESTERN HOUSEBOAT.



AT MOORINGS.

CABIN PLAN.

A, Saloon, 12×17, with piano, sideboard and transom sofas. B, Guests' stateroom, 8×12, with berth, sofa, two wardrobes and washstand. C, Family chamber, 10×17, with double bed, two sofas, two wardrobes, bureau and washstand. D, Reception room, 6½×8½, with one sofa. E, Stairs to entryport. F, Bathroom, 5¼×8¼, with w. c., washstand and bathtub. G, Store closets under entryport. H, Corridors. I, Stateroom, 7×11½, with two berths, washstand, wardrobe and sofa. M, Galley or kitchen, 8½×9½. N, Entry to galley. O, Servants' quarters, four berths. P, W. c. Q, After hatch. R, Icehouse. S, After deck. T, Forward deck.

DECK PLAN.

A, Entryport. B, Cockpit. C, Steps to deck. D, Deck, 17ft. wide, 70ft. long. E, Monitor tops to skylights. F, Steps down to forward deck. G, Whaleback over hatch. H, Galley entryport. G, Galley entryport. S, After deck (stores under). T, Foreward deck (stores under).

the direction of your desire, your staunch, swift and uncapsizable singlehander tugs impatiently and pleadingly at her moorings near by. And what a boat! No example of an endeavor to crowd a quart into a pint measure is she. You have on your houseboat every accommodation you require for your residence, every comfort, every opportunity for ease. Your sailboat on the contrary is your opportunity for healthful and enjoyable work. Absolutely uncapsizable, a beautiful combination of the elements which insure safety and speed, what can compare with the pleasure of sailing in a craft like this, the tiller in your own hand, and perhaps your own little boy at the sheet, proud of his responsible post and alert for your slightest order? As you speed away with a free sheet, your houseboat, with the absence flag flying at the cross-trees, looks fully as beautiful to your eyes as does your friend's big schooner which has just come to an anchor outside you in the deeper and rougher water, and when, after a run to leeward, you haul on the wind for the homeward reach, and your boy takes in the sheet until you stop him with a gruff "belay," you give her a good rap full and lay the lee rail well down to the water with no fear as to what may happen to pots and pans below, no smoke from galley fire to blow into your eyes, and no anxiety as to the cook's comfort, or the welfare of the soup, the joint, or the pastry, for you know that on board that other craft which rides on an even keel over yonder, your cook is busily happy, with your savory dinner sending its enticing odors from oven, pot and pan, and that if this breeze holds, you will be there in less than half an hour to attack it.

And then as you dispose your knees beneath the cabin table and enjoyably begin to assuage the pangs of your ravenous appetite, your memory may perhaps revert to many a jolly, even if uncomfortable, meal "underway" in your bygone yachting days. Assuredly as you contrast the now with the then, your infinite content with the present will not be diminished, and later, with a little choice Margaux to moisten the post-prandial Havanna, you will lay comfortably back in your easy chair, or loll on the transom cushions while your eyes wander with lazy content over your surroundings. There is ample roominess in your cabin, but that does not in the least detract from its air of coziness; and there are vases scattered about and filled with fragrant buds, while living ferns and flowers are growing in the hanging baskets and filling with perfume the ozone-laden air which enters through the cabin windows. And the last benison of the expiring day, the flood of sunshine which comes slantingly through the skylight, kindles the rugs on the floor with more vivid colors, lights up the open piano, gilds the fireplace, flashes from the mirror, glorifies the pictures which are hung upon the wall, and laughs its approval of the ornaments on the mantelpiece, the knick-knacks scattered around, and the thousand and one accessories to comfort and enjoyment which, however out of place and impracticable on board a yacht, are in place, practicable and eminently satisfactory, on board your well appointed houseboat.

FRANK W. WESTON.

YACHTBUILDING IN FLORIDA.

Editor Forest and Stream:

I notice in a November number that one of your correspondents asks about shipping a 55ft. sloop to Florida, also whether such a boat could be purchased there. Such boats are not, as yet, very plentiful here, yet several have been built in this vicinity that have proved very successful, good sea boats and well adapted to use on this coast. By what I have heard of prices of boats of that size, and under, I am quite sure any yachtsman could have his boat built down here for less money than it would cost him in the North, besides saving the expense and risk of shipping. The boat he would get down here would probably not be as finely finished, but of good material, well put together, making a strong, comfortable boat, yet light draft, for to get the most pleasure out of such a craft it should not draw over 2ft.; less would be better, as in winter the tides often run quite low, and a few inches less draft would enable one to be on the move. Most northern boats that have been brought down here are too deep, and their bottoms are mostly soft lumber, which is liable to rough up, and the toredo gets in and does bad work. Good heart yellow pine is better, and is generally used here, though some use cypress and juniper; the last is best for light boats, it being a close-grained, light wood, and does not absorb water as badly as most other woods. For spars they generally use what we call here spruce pine. They are tall and straight, are very light and strong. For knees and timbers they use Madeira, black mangrove, (red) cedar and liveoak. I mention these so that your correspondent may know what a boat would be likely to be made of, and there are plenty of builders that can put up such boats as Turpin's Honest John (which he said was not a cutter), and some that can build almost any style of boat that might be wanted. There is probably no finer cruising ground than this Gulf coast of Florida from Cedar Keys south. There are already several boats along the coast owned by Northern people who come and use them during the winter and house them during the summer, or leave in care of some one. In that way one can always have his boat ready, and at very little expense. By writing to the captain of the Edgewater Y. C., Dunedin, Fla., your correspondent could find out more about it, or perhaps what he wants to know. B.

DUNEDIN, Fla.

ELECTIONS OF OFFICERS.

Corinthian Y. C.—Jan. 19.—Commodore, B. W. Crownshield; Vice-Commodore, I. S. Palmer; Treasurer, Everett Palmer; Measurer, William Eddy; Regatta Committee, E. H. Tarbell, F. M. Wood, A. S. Browne, J. F. Randall, C. S. Denison; House Committee, E. W. Hodgkins, F. A. Seamans, George A. Stewart; Membership Committee, W. S. Eaton, Jr., W. H. Mills, B. B. Crowninshield, R. C. Poor, W. W. Keith; Finance Committee, H. W. Savage, A. S. Browne, C. L. Perrin.

Great Head Y. C.—Jan. 13.—Commodore, Henry E. Turner, Jr.; Vice-Commodore, H. A. Joslyn; Secretary, C. G. Bird; Treasurer, Albert E. Prince; Measurer, Henry M. Belcher; Board of Directors, Charles K. Tewksbury, Clarence H. Billings, E. H. Bradshaw and C. C. Hutchinson; Regatta Committee, Harry Hutchinson, S. A. Freeman, Edward Dixon, J. S. Cushing and Fred M. Melvin; Membership Committee, L. H. Billings, C. B. Belcher, C. P. Flagg, R. H. Mitchell, J. Theodore Washburn, H. T. Crocker, Dawson Miles, Jr., L. T. Harrington and Frank Bradshaw.

Buffalo Y. C.—Jan. 6.—Commodore, Harry D. Williams, re-elected; Vice-Commodore, H. W. Chisholm; Secretary, M. C. Provoost, re-elected; Assistant-Secretary, Henry L. Chisholm, re-elected; Treasurer, W. G. Cowles; Measurer, John H. Swanson, re-elected; Fleet Chaplain, Rev. C. F. J. Wrigley, re-elected; Fleet Surgeon, Dr. H. Mickle, re-elected.

LARCHMONT Y. C.—The rapid and prosperous growth of the Larchmont Y. C. has made it imperative that they should enlarge their present accommodations, and undertake some further improvements which the needs of the members and the fleet demand, but as they do not own but lease the present site it has not been deemed advisable to expend any more on improvements there. The club, however, has lately had an opportunity to purchase the Carver estate, adjoining the present property on the N. W., and at the last meeting it was finally decided to make the purchase. The grounds, about 10 acres in extent, face directly on the harbor, commanding a far better view than from the old location, while the floats will be about as far from the center of the harbor as the present landing, and as easily accessible. The house, a large country mansion, is fitted up in modern style, with running water, gas machine, and all conveniences, and can readily be adapted to the wants of the club. On the estate are two fine springs of water, the only ones in the vicinity. The beach has ample room for railways, laying up in winter, etc., while a good bathing beach is near by, in a secluded part. The price paid was $100,000, to raise which 30-year coupon bonds, bearing 5 per cent. interest, will be issued. Twelve members have already guaranteed to take the entire amount of the bonds if necessary, and the former owner of the estate will take $25,000 at par, in part payment, but it is probable that the entire sum will be taken in smaller amounts by a large number of the members, thus distributing the debt throughout the club, which will be more desirable than having it in the hands of a few. To accomplish this the bonds will be sold in as small amounts as the purchasers wish. As the lease of the present property has not expired, the new purchase will not be used at once, but will be leased this year. This purchase gives the Larchmont Y. C. a permanent foothold on the Sound in a most desirable location, one that is unequaled by any other club about New York; and with its permanency assured the club can undertake such improvements as will alternately make Larchmont all that a yachtsman can demand.

BUOYANCY OF DEERSKIN.—The fact that a full-coated deerskin will support a considerable weight in water has long been known, and a full discussion of the subject was had some years ago in the columns of FOREST AND STREAM. A practical application of this familiar fact has been made by a Norwegian engineer, and the results are noted in the London *News*. It would seem that the experiments detailed below have a practical value of no small importance, and while they bear merely on the buoyancy of the reindeer skin, the conclusions drawn are equally applicable to the winter skins of most northern deer, and in part to the prong-horn antelope. The United States Life Saving Service might take a hint from these notes, and experiments with skins of caribou, elk, mule deer, and mountain goat, and with belts and cushions of antelope's hair would undoubtedly give very interesting results, and possibly be the means of saving many lives. The account referred to says: "A Norwegian engineer, Herr W. C. Möller, has made some important discoveries as to the buoyancy of reindeer hair and skin. He has found that a reindeer skin weighing 1 7-10 kilogrammes, rolled up with the hair outward, will support for ten days the same weight as an ordinary cork life-belt. Moreover, the reindeer skin has the advantage of warming a person if formed in the shape of a life-belt and worn around the waist. He has also constructed collapsing boats, sledges for rescuing people from drowning in the ice, etc., from reindeer skin, and life-belts filled with reindeer hair, equal to those of cork. Herr Möller further finds that a suit made from reindeer hair, weighing only one-half kilogramme, will save a man from drowning even if it has been in the water for some time. It can be made in any thickness and is warmer than other materials. He is confident that suits made from reindeer hair will in time supersede those made from oilskin. The life-saving establishment at Gothenburg has already procured several of these articles."

THE PLANS OF THE THISTLE.—The Boston *Herald* calls on the FOREST AND STREAM to admit that the plans published by them came from Mr. Watson's office, and that they are the working drawings of the new yacht. We have never denied that they originated in Mr. Watson's office, or that they relate, more or less closely, to the Thistle. The term "working drawing" is rather indefinite, and may mean anything from the first crude sketches to guide in making up estimates to the carefully prepared plans and details from which the yacht will be built, the latter being the proper meaning. According to the first interpretation these are "working drawings" made for the purpose we have before specified. We maintain, however, as we have done from the first, that there is no evidence supporting the statement that they give the accurate length, breadth and depth of the Thistle. In proof of this is the fact that now, four weeks after their publication, there is just as much doubt as to the Thistle's length as there was before they appeared. Many yatchsmen in New York believe that the Clyde yacht will be from 70 to 75ft. long, while according to a late statement of the Boston *Herald* Mr. Burgess so far discredits the plans as to look for a yacht of 90ft. length. Mr. Watson has declined to make any statement concerning them. It is reported that the keel of the Thistle was laid last week, and that her frames were all bent and ready for erection. No doubt when her size is made known it will be a surprise to many, a surprise in no way lessened by the "great scoop" of the Boston *Herald*. She may be 80ft. long, but she is just as likely to be 70 or 90ft, and until the so-called "plans" have been corroborated by ample evidence, yachtsmen will continue to discredit them.

THE OCEAN SWEEPSTAKES.—No other owners have yet come forward to join Messrs. Bush and Colt. As centerboards are to be admitted in the jubilee race, it would seem the proper thing that some provision be made for them in the way of a race across. Mr. Bush has replied as follows to Mr. Colt's letter of Jan. 16: "NEW YORK, Jan. 18, 1887.—John H. Bird, Esq., Secretary New York Yacht Club: Dear Sir—I beg to acknowledge the receipt from you of a copy of Mr. C. H. Colt's letter to you of the 16th inst., signifying his intention to enter the Dauntless for an ocean race with the Coronet. Permit me to say that I am much gratified to learn that the Coronet will have at least one competitor, and I would be much more gratified if several other gentlemen owning keel schooner yachts would enter their vessels in the race with the Dauntless and Coronet. Kindly say to Mr. Colt that from the 1st to the 15th of March would suit the Colonet better than the 15th of May, and that my only purpose for naming so late a day was in hope that owners of some of the smaller keel yachts would send them across in May, whereas if the start were to be made in March they would probably stop to consider. Yours very respectfully, R. T. BUSH."

ICE YACHTING.—A race was sailed on Jan. 19 with the following starters: Grover Cleveland, George Coley, first; Uncle Bob, William Haviland, first; Kitty, James B. Weaver, second; Georgie, Charles Throckmorton, second; Typhoon, R. Chaudler, second; Flirt, A. Brown, second; Joe Owl, Charles Allen, third; Zero, Ed Throckmorton, third; Snowflake, Charles Henderson, third. The course was 12½ miles, and the start was made at 11:35:15 A. M. The Cleveland won in 46m., taking the championship pennant. Kitty won the club pennant, time 48m., and the Joe Owl won in third class. Typhoon, the new latecn, capsized. On Jan. 20 a race for the North Shrewsbury pennant was sailed over a 12½ mile course by the second class boats. Kitty won in 41m. 45s. In first class Uncle Bob and Grover Cleveland raced for a gold-lined silver goblet, the Cleveland winning in 43m. A race for second class, prize a set of knives, was won by Kitty, with Typhoon second. The weather on the Hudson has not been favorable for ice yachting.

A NEW SURVEY OF LARCHMONT HARBOR.—At the request of Com. Alley, of the Larchmont Y. C., the engineers of the U. S. Coast Survey when at work on Long Island Sound made an accurate survey of Larchmont Harbor and its approaches. A copy of the completed chart with the accompanying letter has lately been received by Com. Alley: U. S. Coast and Geodetic Survey Office, Washington, Dec. 30, 1886.—Com. W. S. Alley, Larchmont Y. C.—Dear Sir—By direction of the Superintendent I have had the tracing made for which you asked in your letter of Oct. 7. It gives me great pleasure to forward this tracing in token of the recognition by this office of your services and kind attention to our parties engaged in the survey of Long Island Sound.—Yours respectfully, B. A. COLONNA, Assistant in charge of office.

STEAM YACHT RACING.—At the last meeting of the A. Y. C. the Secretary reported the $10,000 prize was being made by Tiffany & Co., and also read a letter from the Royal Yarmouth Y. C., notifying the club of a prize, £400, offered for a race in honor of the Jubilee year, which prize is open to American steam yachts. It was proposed to hold two regattas this year, and one at least over another than the club course. The club is now taking action to secure a site for a permanent club house, and $75,000 has been subscribed for the purpose. The matter is in the hands of Messrs. J. P. Kennedy, G. W. Hall and Henry A. Taylor. The membership roll shows 200 names, or 40 increase, with a fleet of 23 yachts.

THE LOSS OF THE OUTING.—The little sloop Outing, in which Capt. Cloudman started on a cruise around the world, was wrecked on Jan. 18 off the Florida coast, near Jupiter Inlet. Outing left Jacksonville on Jan. 1, and St. Augustine on Jan. 12, bound for Nassau. Besides Capt. Cloudman, a passenger, George Muller, of Rondout, N. Y., was on board. The weather was bad, and on Jan. 18 the yacht went ashore in a heavy sea, being a total wreck. Her crew were washed ashore after a narrow escape from drowning, and found refuge in the life-saving station.

CENTERBOARD YACHTS IN THE JUBILEE RACE.—The Royal Thames Y. C. has decided to throw open the ocean race to centerboard yachts. As it has been "conclusively proven" that the centerboard is faster than the keel, the only questions left is which of the American centerboards shall take the 1,000 guinea prize.

NOTES.—Larline, steam yacht, will leave New York early next month for a cruise about Florida. Her owner will join her at Savannah.... Commodore Rhodes of the New Bedford Y. C., has ordered a steam yacht 70ft. long from John Mumm. Mr. Mumm has also in hand a 35ft. launch.

NOTES.—Em-Ell-Eye, the fast Boston catboat, will have a hollow mast this winter and may come out as a jib and mainsail boat. Mermaid—The purchaser of the Mermaid is Mr. W. D. Anderson, Jr., of East Orange, N. J. North Star, sloop, will change to double head rig.

A NEW SHARPIE.—Mr. Thos. Clapham is at work on a non-pareil sharpie with the Roslyn yawl rig, for a New York yachtsman. She is 31ft. over all, 8ft. 6in. beam, 3ft. draft, with keel and no centerboard, and will be uncapsizable and non-sinkable.

CAPE ANN Y. C.—At a meeting on Jan. 19 it was proposed to hold a series of trial races and to select two boats each from first, second and third classes, and issue challenges to all clubs in Massachusetts to sail for a cash prize of $200.

MR. BURGESS ON YACHTS.—On Jan. 19 Mr. Edward Burgess delivered a lecture before the Society of Art, at Boston, on the "Evolution of the Modern Yacht."

MAYFLOWER.—The report has been current for a few days past that Dr. J. C. Barron had purchased Mayflower, but it is contradicted by Gen. Paine.

THE NEW Y. R. A. RULE IN AMERICA.—The first American club to adopt the new length and sail area rule of the Y. R. A., is the Royal Nova Scotia, of Halifax, N. S.

STEAM YACHTS FOR SALE.—We have received from Messrs. Field & Young, of No. 6 State street, N. Y., a list of steam vessels of all kinds for sale by them, among which are a number of steam yachts of all sizes.

ANOTHER NEW MODEL.—Mr. John L. Frisbie, Instructor in the School of Naval Designing in Boston, has completed a model 75ft. L. W. L., 21ft. 6in. beam and 9ft. draft, which will be sent to the New York Y. C.

THE TRAVELERS, of Hartford, has paid its policy-holders over $11,200,000 for death and disabling injury.—*Adv.*

Canoeing.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signal, etc., of their clubs, and also notices in advance of meetings and races, and report of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

THE A. C. A. AND THE W. C. A.

Editor Forest and Stream:

The time has come when we may look for ratification of the errors which led to the establishment of two canoe associations in America. There is a good prospect of reunion. Therefore, Mr. Editor (and through you the members of both associations are appealed to), let us not waste time in worse than useless recapitulations of old misunderstandings, but go right straight to the point and reunite. Let the American Canoe Association, without preamble or hesitation, invite, by resolution of its Executive Committee, the Western Canoe Association to become the Western Division A. C. A., under its own officers, and let these then join their comrades in the task of completing the constitution and getting order out of the present chaos. In less than a year we may have, if we act wisely, an organization equal to and ready for the national character it is achieving. ROBERT W. GIBSON.

ALBANY, N. Y., Jan. 25, 1887.

W. C. A. REGATTA PROGRAMME.

THE general programme is as follows:

Monday, July 18, formation of camp.

Tuesday, July 19, general cruising and visiting and review of fleet.

Wednesday, Thursday, Friday, Saturday, July 20, 21, 22, 23, following races at discretion of Regatta Committee.

Race No. 1—Sailing 3 miles, open to all classes; no limit to ballast or rig.

Race No. 2—Sailing; Class B, 3 miles; no limit to ballast or rig.

Race No. 3—Sailing; Class A, no limit.

Race No. 4—Paddling, Class II., 1 mile.

Race No. 5—Paddling, Class III., ½ mile.

Race No. 6—Paddling, Class I., 1 mile.

Race No. 7—All classes 3 miles, sail first half mile, paddle second, sail third, paddle fourth, sail fifth, paddle sixth. The sails to be entirely lowered and stowed away each race.

Race No. 8—Double paddling, 2 men; Class IV., ½ mile.

Race No. 9—Classes I. and A, 30ft., upset.

Race No. 10—Sailing; all canoes, ½ mile; open to novices only.

Race No. 11—Paddling, Class IV., ½ mile.

Race No. 12—All classes, sailing, 6 miles, no limit to ballast or rig. This race to be for the Gardner Challenge Cup.

Race No. 13—All classes, ½ mile, sailing, upset with sails up; must have open cockpit; no hatches or special appliances allowed.

Race No. 14—Hurry-scurry, open to all men, 100yds. swim to canoe, paddle 200yds.

Race No. 15—All classes, sailing without ballast 3 miles.

Race No. 16—Hand paddling 100ft.

Race No. 17—Tournament.

Friday evening, Canoe hop at Wehrle's parlors.

Thursday evening, annual meeting for election of officers for ensuing year.

5 P. M. Saturday, presentation of prizes.

THE PROPOSED REGATTA PROGRAMME.

Editor Forest and Stream:

The Regatta Committee have asked us to look over the proposed regatta programme for 1887 and see what changes can be made in it for the general good, so here goes for an opinion.

Event 1 says that open canoes shall be propelled with a single blade. The idea was, I suppose, to put all on as even a footing as possible. It seems to me that this change will not accomplish that object because nearly all Class II. and III. canoes are paddling craft pure and simple, and nine-tenths of them are propelled with double blades, and I venture to state that the majority of their owners will deck their canoes with cotton, canvas, or cedar sooner than discard their double paddles which they have found by experience to be so much faster than the single blades. The decking may only weigh from 5 to 10lbs. and will be a decided advantage to them in rough weather in keeping the water out, while it will make no perceptible difference in their speed.

This being the case it is proposed to ask Class IV. men to paddle their comparatively big and heavy sailing, or general purpose canoes, against the crack paddlers of the A.C.A. who have Class II. or III. canoes, which seems to me would be most unfair because a man who sails has to have a heavier and stronger built canoe to stand the strain of the large amount of canvas they carry, besides the extra weight of centerboard trunks, centerboards, mast tubes, air chambers, rudder, etc., which amounts to considerable.

I would suggest that we have a paddling race for Classes A and B sailing canoes, it could be paddled at the same time as the other race, would not lengthen the programme, and, it seems to me, would give general satisfaction. For though Class A men have smaller craft to paddle they are, as a rule, smaller in stature than their B. brethren, and that would just even up the account.

The next article that I struck a snag in was No. 4, and I beg to place myself down as a kicker against a 75ft. limit, without ballast, as it is legislation directly favoring small canoes, and I see no reason why they should be so favored. As many of them can only carry 75ft. in an ordinary breeze, while some of the larger craft are built to carry 100ft. and over, and if no ballast is carried to even up matters the machines will take this race every time. I do not know why the 75ft. limit was ever adopted (it was before my time), but I understand it was considered a cruising rig, if such was the case let us all carry a load then such as we cruise with, make the canoe and load weigh, say 150 or 200lbs., the same as in the loaded paddling races last season, and give those members who have canoes big enough to sleep in comfortably a chance for the race.

Race No. 8 again tells right against those who use sailing canoes in this race. The average canoe that is fitted for sailing weighs 100lbs., while the average paddling II. or III. canoe weighs about 50 or 35lbs., and you ask the general purpose canoe to carry 75lbs., or a total of 175lbs., and the paddling craft, pure and simple, to carry 75 or a total of 105 or 110lbs., which can be seen at a glance is a big handicap on the sailing canoe. I would suggest that if we must paddle our general purpose craft against strictly paddling canoes that the "canoe and load" weigh a stated number of pounds.

With reference to No. 10 the Regatta Committee will have to be careful that the Society for the Prevention of Cruelty to Animals does not drop on them for adding that extra half mile. I was in three of the mile paddling races at the last meet, and with the aid of the experience I have had have come to the conclusion that a mile race is a good test of endurance and skill, and for anything over that distance you have to put in just so much more training, which makes the sport smack of professionalism. You must remember that some of us general purpose fellows go into two paddling and one combined event in one day, which, with a sailing race or two between times, makes a very heavy day's work. I would like to hear from some of the '86 racing men on this point. We will now pass on to the International race for the Challenge Cup. This is *the* race of the A. C. A., and should favor no one, but let the best canoe win. Rule 12 says: "American contestants to be chosen from the leading men in events Nos. 4 and 9. No limit to rig or ballast." Now why that No. 4 limit race should count for a race that is going to be unlimited I cannot for the life of me see.

I was going to say that a foot race would tell you just about as much, but that would be getting on the shady side of truth. I know a member who was in the first ten in the unlimited race in '86 and who only took twenty-third place in the limited race. The tenth place showed what he really could do when he sailed his canoe as he pleased, and the twenty-third place showed the best he could do when they handicapped him by saying you can only carry 75ft. of sail in this race.

By all means let us have only unlimited races to count for the unlimited International Challenge Cup race. I would suggest that we have an extra unlimited race that would not count on the Record, but that taken with event No. 9 would count for the International. The A. C. A. only comes once a year, and if you break a line or some of your gear gets out of order in No. 9, you cannot tell how you compare with the other sailors for at least another year. I have a word or two to say with reference to the club race, but as I have spun this out much longer than I had any intention of doing, I will postpone it for some future time. MAC.

TORONTO, Jan. 9.

Editor Forest and Stream:

The generally admitted defects in the old A. C. A. programme for paddling races were that no distinction was made in the different classes between a light open canoe and a heavy sailing canoe, and that consequently most of the races were won by what might almost be called paddling machines; also that owing to the small amount of competition in Class II. (and in Class A, sailing) a 20in. had a very unfair advantage in the Record competition; and that, thirdly, there was no need for two races in each paddling class, as one race sufficiently tested both men and boats, and the second race only served to render the programme long and tiresome.

The Regatta Committee evidently intend to even up things between the open and decked canoes by compelling the crews of the former to use the single paddle, which is now generally admitted to be slower than the double; but would not the owners of the open canoes add light decks to their boats and paddle with the double as before, while the owners of Class IV. decked canoes would give up paddling in disgust?

Even if the open canoes were paddled with the single, how could there be a satisfactory race with probably between thirty and forty contestants? Last year about this number entered in Classes II., III. and IV., taken together. A better system, in my opinion, would be to have five classes, as follows, and only one race in each class, either with a cruising boat or not, as might be thought best:

Class I. Any canoe.
Class II. Decked canoes, Classes II. and III.
Class III. Decked canoes, Class IV.
Class IV. Open canoes, Classes II., III. and IV., double paddles.
Class V. Open canoes, Classes II., III. and IV., single paddles.

There is not much difference between Classes II. and III., and probably there would not be a sufficient entry to justify more than one class, while the large entry in Class IV. would necessitate a separate class. Thirteen entered last year in the class.

Class IV. would provide a class for those who paddle open canoes with the double.

Class V. would give some encouragement to those who use the single paddle, and there would probably be a large entry, as the single is the generally preferred implement for propelling an open canoe, and it is only the greater speed of the double which has brought it into use for racing. All Canadian clubs are now offering special races for the single, and the Association ought to follow suit.

This programme would be too long for two races in each class, but why have more than one in each class? I never met a paddler yet who considered the second race anything but a nuisance, and who would not have been glad to see it abolished. If it were necessary for Record purposes, give the winner of a paddling race twenty points. W. A. LEYS.

Editor Forest and Stream:

In response to the invitation of the Regatta Committee I beg to offer a few comments on the proposed programme of races for the A.C.A. Regatta 1887.

The rule to compel open canoes to use single blade paddles is an excellent experiment. So is the No. 6 sailing race "man overboard." I trust both those novelties will be tried.

In sailing race No. 4, or any other race with limited sail, the sail limit or 75.t. should be retained because it is, after all, a necessity that settled rules should be conservatively treated, and 75.t. rig is generally conceded to be a fair moderate amount. Everybody does not want to get a new rig every year to suit some new limit, and on the other hand it is desirable that clubs and the A.C.A. should at some uniform and general rules (the Western C.A. has, by the way, just adopted the A.C.A. rules). Therefore, let us be conservative and keep 75ft. as the limit. The load proposed is carried as a cruising equipment test; let it be real actual cruising equipment and a fair quantity, about 50lbs. To allow shot or lead would be to encourage ballasted boats under false colors. Why should the crew sit inside? As well stipulate that he should smoke or otherwise make himself largely comfortable. If we race even in cruising trim we are to make an effort, and I doubt whether anything is to be gained by a limitation which men would not, if cruising under like conditions, impose upon themselves.

The club race will be a great event, but the conditions should be such that each club is induced to put in as many representatives as possible. As at present arranged the safest way would be for a club to trust to its best men alone. Probably a good plan would be to simply let every man score on the average record system; or, perhaps, to allow as many to race as any club can enter, but only the first three of any club can score for it. Whatever the Regatta Committee decide, I for one will accept and thank them for a good stimulating effort at novelty in the programme. These comments are frankly given, as they are invited, in the hope that they may be of use and are not to be read as criticisms. R. W. GIBSON.

ALBANY, N. Y.

Editor Forest and Stream:

In a late issue you give the site of the A. C. A. meet, Bow and Arrow Point, as being about twenty miles from Plattsburgh. Allow me to correct you on this point, also give distances from other places from which the site is accessible: Plattsburgh, about 7½ miles; Burlington, Vt., about 18; Swanton, Vt., 10; Rouse's Point, N. Y., 20. I am well acquainted with the locality and can assure you these distances are very nearly correct.

WHITEHALL, N. Y. WM. C. BLODGETT.

CANOE VS. SAILING BOATS.

Editor Forest and Stream:

The writer has some ideas, which, if erroneous, he would like to have corrected. He thinks the majority of canoeists in the A.C.A. live on water, which, strictly speaking, cannot be termed narrow, winding or abounding in rapids. The proof of this is apparent to any one who will locate A. C. A. members on a map. He also infers that most canoeists use their canoes mainly for afternoon sailing and short runs of a day or two. His reason for this is observation of the club of which he is a member, and the meagre number of cruises published in proportion to the number of canoeists. Now, if these ideas are not wrong, why would it not be a benefit to the majority of the A. C. A. to devise a cruising boat, which for use, other than in rapids or narrow winding streams, would have every advantage over a narrow cruising canoe? The writer thinks that a decked rowing and sailing boat can be built which will row single handed faster than any all-decked canoe can be paddled by one man. She will cruise the same canoe "with ridiculous ease," as Mr. Clapham has it. She will crown her in a sea. She will be a steadier, dryer, safer, pleasanter boat to sail, and will handle in all weathers with more certainty. She can be hauled ashore for sleeping purposes or into the boat house by one man with ease. No, you could not portage her any great distance, dear narrow canoeist, neither can the average man a Monican No. 2, or any other successful sailing and paddling canoe of to-day. Now, don't think the writer wants you to give up your pretty craft. Do as your own good judgment dictates, but do not labor under the hallucination that a narrow decked canoe will outsail a properly rigged sailing skiff or that she can be paddled by one man faster than the skiff can be rowed single-handed.

It is simply nauseating to read how this or that canoe or small boat beat the yacht Worthless. The writer has known an 18ft. sailing skiff to outrun for a short distance in a strong puff a smart 50ft. steam yacht with her throttle wide open, but what sensible man would claim the skiff to be the faster boat. The writer does not assert that a match between a sailing skiff to be a fair one for the canoe. What he does claim is that the skiff is the abler, faster boat and should of necessity be such. SAILING SKIFF.

Editor Forest and Stream:

In the issue of the 13th inst., I noticed an article from a Buffalo man, Mr. Shamp. To say that I was surprised and greatly amused at that portion of the gentleman's article which refers to the cutter yacht Vera, is expressing it mildly. Allow your imagination an unusual flight and see if you can reconcile yourself to the statement made by Mr. Shamp, that a cockle-shell of about 15.t. over all and less than 4ft. beam could carry all plain sail, when the Vera was obliged to put on a double reef; the Vera, bear in mind, being 40ft. over all with 11ft. beam, draft 6ft. with good ironboard. The Vera was designed, I believe, by E. A. Cary Smith, of New York, and her owner, Mr. Andrew T. Ball, of Port Dover, Ont., Can. When ordering her model from Mr. Smith, he informed him, as he told me, that he wanted a boat that would stand anything and everything, and it is the general opinion that Mr. Smith

carried out his instructions to the letter. Among the many good points of the cutter, if there is one which predominates, it is her ability to carry canvas when it blows. Mr. Shamp must have thought it odd, that while the Vera carried a three-reef mainsail (each being the case, instead of two, as he stated), that she also carried an enormous topsail and double headsail. The Vera being of the Buffalo Y. C. fleet, often surprises, most agreeably, her cousins in "the States" with a visit. On the occasion of her last visit, about Nov. 15, she was favored with a 35 or 40-mile wind, and coming into the harbor, or rather, in crossing the mouth of the Niagara River, the wind being dead aft, she jibed her boom and it broke about 10ft. from the jaws, and when the boom was repaired it was found to be too short to carry more than a three-reef mainsail.

On the morning of Nov. 21, when our friend, Mr. Shamp's cockle-shell performed its wonderful feat, the Vera people said their adieus, and myself and some other members of the club who were present, took their places and gave them headway to clear the dock. So light was the wind, however, that the cutter slowly but surely drifted over to the lee side of the slip, and was finally warped along the dock to clear water. Meanwhile my friend Shamp was well up to windward, as he says. After the Vera had pounded in the sea for about two hours she put back under the Government breakwall to wait for sufficient wind to go home with, which came about sundown, when she went on her course. I should have left the defense of the Vera to Mr. Ball, did I not understand him to be absent from his home, and, therefore, not likely see the article in your late issue.

I doubt not my fellow yachtsmen will be amused at Mr. Shamp's article when they recall the cutter's behavior in 30-mile breezes, for many of us have seen her in such weather with all canvas spread, in fact it is Mr. Ball's boast that the Vera has never had her rail under water, and it is not for the want of trals that she has kept it above. I understand that Mr. Shamp's article has roused the ire of several members of the Buffalo C. C., and that it is quite likely that he will have an opportunity of backing his fresh-water Mayflower against some canoes here of less renown.

I trust that you will pardon me for having taken so much of your time on a matter of so little consequence.

HARRY D. WILLIAMS, Commodore B. Y. C.

Editor Forest and Stream:

The remarks of Mr. W. P. Stephens in your last issue express exactly the desires of last year's Regatta Committee when they placed the unclassified race upon the programme.

"Mr. Stephens can perhaps set the matter right," says Mr. Clapham. I think he has effectually done so as far as showing that the Red Jacket or any other unclassified canoe were not barred from a race of the Association, and I hope we have heard the last of his assertions to that effect. There was a race provided for which Mr. Clapham's boat was eligible, but for some reason best known to himself he did not choose to make an entry for it. Had he done so he would have had plenty of competitors, as two at least of those who competed for the Challenge Trophy expressed themselves to me as being willing to give him a race should he enter.

I would be sorry to think that Mr. Clapham would intentionally interfere with a racing canoe. However, I can only reiterate what I said before, that complaint was made of his boat for interfering with the racers, and the extremely lengthy gentleman whom he so sarcastically refers to as doing a "deal of incomprehensible and unnecessary shouting," did so at the request of the Regatta Committee, and although Mr. Clapham calls it incomprehensible now, he evidently understood it at the time.

I will not enter into a discussion as to which is the faster, a canoe or a sailing boat, as I do not believe that can be proved on paper, but I cannot allow Mr. Clapham's insinuations that the A. C. A. is not on a level with other modern boating fraternities, and that canoeists hang 50 or 60lbs. centerboards and stow shot in their canoes to pass unnoticed. As to the first, I would like to know where there is an organization for a like purpose that compares with the A. C. A. in membership, or with a more liberal or honest sportsmanlike spirit among its members. From the latter any one not knowing better would infer that all canoeists had centerboards weighing 50 and 60lbs., and in addition, shot to their taste. Such is not by any means the case, for of the hundred or more canoes at our last meet I will venture to say that there were not ten whose ballast and centerboards together would weigh 50lbs. I think it has been proved that canoes like the Red Jacket do their safest and speediest sailing when light. J. B. MCMURRICH,

OSWEGO, N. Y., Jan. 17. Chairman Regatta Committee, 1886.

Editor Forest and Stream:

In reply to "Perch's" remarks on my former letter, I never considered my boat a marvel; would willingly undertake to build one that would beat her. The "sloop-rigged clinker," not carboat, was not the Arrow, but a lapstreak boat, sharp at both ends, of about the proportions mentioned. I do not consider the skiffs let at the boat houses worth sailing against. I have never sailed on the river, prefering the lake; have heard of some fast boats on the river, notably the Snake. I presume Perch owns one of these fast boats; if so, I will sail him a series of races—one on the lake over a triangular course; one on the river over a course he may select, and the third, if necessary, to be decided on later; open to any skiff, one man to each boat, the loser to furnish a pennant to be held by the winner until won from him by some other skiff. I did not intend to depreciate the Vera, but to show what a small boat could do. I agree with him that the cutter could drown out, not the majority, but any of the yachts here. Would say to Mr. Leopold that I may try the weather grip next season; my objections were its extending so far outside of the boat, 3ft. on each side, making with the boat's beam nearly 10ft., so that it would have to be unshipped in narrow places, and the room it would occupy when unshipped. D. C. S.

BUFFALO, N. Y.

AN ENGLISH SUMMARY OF THE PAST SEASON.—"Reviewing the status of canoeing now at the close of 1886, there cannot be a question but that the deck sitting and steering position must considerably influence the design of canoes in the coming season and thereafter; and if extreme types be guarded against, the allpowerful deck position will be found to supply the sailing counterbalance hitherto obtained by lead. Stability before the wind (when the deck position is non-effective), and in the absence of lead, must be gained by a flat floor and moderate sail area, and that racing speed can be attained under such conditions has been amply proved in the American matches. How craft according with these conditions will perform in English blowing weather with sharp, relentless squalls, is a blank page to be filled up during the next season. One great result, however, may be looked for with confidence; that is, a diminution all around of size and weight, and consequently an increase of popularity for canoe sailing."—*W. Baden-Powell in the Field.*

A LESSON FOR NOVICES.

THE new member was holding forth after the usual manner of novices. Said he: "There's nothing like it. If it's calm, you paddle; if there's a wind, you sail; if it blows too fresh, you reef. Then at night, no hunting for a sleeping place, no bad supper at a worse hotel. You just bend your tent over the cockpit and turn in." Delightfully salt and full of zeal was the new member. This and more like it was said by the enthusiast to a group of canoeists toasting their shins at the radiator. Most of them were knowing old birds who had moulted the pin-feathers that were the plumage of the new member. One of them had the rheumatism and another had a cough, and even the best of them had, at times when none but the elect were within hearing, inveighed against canoeing. But let an outsider come within range, how quick the tune changed, and blue skies, soft winds and quiet waters became the theme. On this occasion there was no outsider, but there was an enthusiastic beginner, full to the lips with the poetry of canoeing, and with a brain well stocked with "Canoeing in Kanukia," and "Canoe Handling," not to mention the classics of "Rob Roy" and Baden-Powell.

It is a pleasing attribute of human nature that causes an old man to forget that he was a boy once, and which impels the experienced to clip the wings of fancy and fervency with which the inexperienced are fluttering. The season did not admit of a bodily illustration of some of the unpleasant features of the sport; but in duty bound one of the sad sea dogs, after lighting a cigar given him by the new member, proceeded to administer a mental capsize. "I've noticed," said he, "when paddling has to be done, it's always under a broiling sun, and when the breeze comes it does not always blow in the way you wish it; in fact, as a rule, it never does——"

"That's what Vaux says," interrupted the new member.

"Confound your interruptions and quotations," says the old 'un, "you'll now and again find there are some things outside the books. Now here's a bit of a yarn, and the Colonel there, or the Commodore or George Washington, will stand sureties for the truth of it.

"A couple of years ago——"

"Three," interposed the Colonel.

"Yes, you're right. Three years ago the party I have cited as witnesses concluded to take a little cruise up to Nine-Mile Point, to look after the black bass which rumor reported were waiting to be hooked. G. Washington and myself started from the bay about noon Saturday, and the rest of the fleet were to come on that night. Standing on the pier at Charlotte and looking eastward, the long, finger-like projection called Nine-Mile Point, doesn't look very far off, and it isn't when one has the brisk west wind G. W. and I had. We didn't notice how lively the wind and sea were until we made a leg for the shore. Then we felt the wind, and the waves that had helped us along so nicely when we were going their way, did not look so pleasing when we had to cross them.

"Half way in, the clutch on George's boom blew off, and while he was fishing for it I made the shore. I suppose I did it in ship-shape manner, any way, I did it quickly and didn't get much wet. After sticking up and hanging out the wet things, we walked up and ran foul of a family picnic. G. W. knew one of the party and accepted an invita ion to supper. We went back into the country a mile or so, we had a tip-top meal, and after it I was treated by the farmer to some of his birch bark reminiscences when he was lumbering in Canada, while G. W. talked with his daughter, a deucedly pretty girl."

"That's it," put in the new member, "everybody treats canoeists well, and all the pretty girls ——"

"Wait till I have finished. The tune will change shortly. Well, we got back to the boats and fixed up for the night. The wind let up at sundown, and about midnight the Commodore and Colonel, together with B. and A., whom they had picked up at the Bay, put in an appearance. The Commodore and the Colonel came tandem, and B. and A. sailed that romantic old craft the Rowena. Sundry bulkheads and a liberal supply of lake water made her untenable, and the Sofronia only had cabin room for her skipper, so the Colonel and B. and A. camped out under one blanket, no very great hardship, for the night was warm, the sand soft, and there were no mosquitoes."

"When does the tune change?" inquired the new member.

"It changes now. About 5 o'clock in the morning the wind chopped around into the east and the weather turned cold. By 8 o'clock the wind had hauled into the northeast and a lively rain began. Lake Ontario hasn't much patience with a northeast wind and by 10 o'clock the rollers were booming on the shore. No getting away that day. We made a pilgrimage across country to a village—I won't impose on your credulity by stating how many miles it was—hunted up a telegraph operator and wired to the city. You see we didn't desire to have the community alarmed and we knew of several business men who might view an unaccounted for absence in an unpleasant light. In the afternoon the clouds broke away and the sun came out, but the wind increased to a gale and had shifted to the northwest. We dug out of the sand and braced up for a wind break, a centerboard from some wrecked schooner, and built a driftwood fire behind it.

We turned in early. B. and A. and the Colonel bunking between the fire and the centerboard. Under the canoe tents it was cosy enough, but during the night the wind got around to its old quarters and the two out-lyers woke up half perished. Their nosing around the bottle of strong water which the Commodore had, wakened the entire party, and rebuilding the fire we watched the day dawn over a waste of troubled waters. The gale held all that day, and it required an effort of imagination to believe it was July, for though the sun shone brightly, the wind was particularly frigid. Do what we could the hours were very long and most of the day was passed in trying to solve the problem why, no matter which way the wind blew, the smoke would always blow into one's eyes. Finally night came, and moving our quarters back from the shore and into a barn we turned in.

About nine o'clock the Commodore awakened us with the intelligence that the wind had dropped and the sea was going down. An hour later we were ready to shove off. There was a nasty swell on and the getting away was sharp work. While we were at work little puffs of wind began to put in from the northeast, and during one of them the Commodore and the Colonel put off and went lying up the lake. G. W. came next, then I started. When B. and A. tried it a big roller drove his stern into the sand and unshipped his rudder. In trying to aid him I got a big wave in the chest, and finally he had to go overboard. At last he got off. I was wet, and the wind being particularly cold, I feared the inaction of sailing would give me a chill, so I buckled down to the paddle. Paddling out to gain an offing I found G. W. endeavoring to toggle up his boom clutch which had parted. Chancing to look back, there stood my lantern on the shore. It looked so desolate and lonely that I put back after it. After I had rescued the lantern and put off for the third time, I caught a passing glimpse of the Rowena's sail standing, apparently, out to sea. Then it disappeared and I was left alone. The shore line was dim and indistinct and the wind, which was growing fresher, was beginning to put white caps on the waves. I could hear them hissing after me, and now and then a big fellow would catch the canoe and hurl it forward. It was too dark to see the waves coming and the navigating had to be done by hearing and feeling. The worst feature was that of utter loneliness, and at times it grew into quite a panic. I sang at the top of my lungs and shouted to keep up my courage. Gradually the wind was drifting me on shore, and knowing that there was a point ahead with several bad rocks lying off it, I tried to make a little more offing. A short trial convinced me that it was too much for my strength, and that the best thing to do would be to run the gauntlet of the surf and beach my craft.

Along the shore at various spots, little creeks came into the lake, and at the mouth of each grew clumps of trees. Fixing on one of these spots as a likely place to land, I put on steam and headed for it. It didn't take long to run in, and the nearer I approached the higher the line of breakers seemed to grow, and the roaring they made was anything but assuring. It was too late to back out, so holding her bow straight on to a bunch of stunted trees that marked the delta of the little run, I worked the paddle with all my energy. An unusually big roller gave me an unexpected lift and threw canoe and crew together on a pile of drift wood and tangled roots. I don't know that I followed all the directions the books give for beaching a canoe in a gale of wind, or whether I performed the details in their regular order. At any rate, I found myself on shore, with some remarkably uncomfortable roots jabbing me in the ribs, and with the canoe on top of me. Hauling her high and dry, I made the canoe fast to a tree, to show she was not a derelict, put on the hatches, and, lantern in hand, struck out for the railroad track that skirts the lake shore. Carping critics and pin hole investigators have wasted a deal of valuable time in debating what Bobby Burns really meant by 'comin' thro' the rye." I settled that question to my own satisfaction by floundering through an interminable field of rye, and know that Jenny could have "dranglt a' her petticoatie" in that field of malt-weed as completely as if she had walked in a river. Getting out of the rye, I stumbled through a patch of woods, then wallowed over a bit of swamp, and finally got into a pasture lot full of cows. They must have taken me for the milkman, for they all followed me, and when about half way across began to exhibit a humorous tendency. I never did appreciate cow fun, and in my haste to get to a fence failed to take the proverbial look before I leaped, and fell in a ditch.

Extricating myself from the mud and casting about for some landmark to steer by, I discovered a telegraph pole on the hill above me, and in a short time I was counting ties toward home. Reaching the bridge over the outlet of the bay, I saw a strange nondescript figure prancing about on the abutment. It was George Washington, who had tied his waterproof apron about his hips to keep the cold wind off his legs, and was dancing to restore circulation. With great judgment (he claimed), I call it luck, he had hit the outlet and run in safely. For upward of an hour we tramped around, but no light, either up or down the lake, gave token of the other members of the party. We could do them no good by waiting, so we packed into George's canoe and lay a straight course for the club house. Words are too weak to describe the comfort of the blankets we crawled under or the beneficent effect of the "medicine" we forced ourselves to take.

Two hours later we were awakened by a call from B. & A. Belated by the waves and miscalculating the distance and range of the Charlotte light he had gone off his true course so far that it took a three mile beat dead to windward to get back to the outlet. Cold, cramped and exhausted he could hardly get out of his canoe. We dosed him and put him to bed and turned in ourselves. It must have been half past eleven the next morning when we heard the hail of Huff on the bay, and we scrambled out to see the Commodore land from a rowboat. They had missed the outlet and gone ashore a mile or so below, and after a miserable night over a smoky fire, had discovered at daybreak that they were camped in front of and not two rods from the summer cottage of a friend. B & A. was laid up a week, G. Washington dates his neuralgia from that cruise, the Commodore had a cold that hung to him and spoiled his singing at the meet that year, I had the rheumatism, and the Colonel, well he's a seasoned old fish, and he escaped.

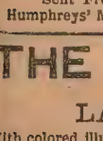
And the new member was idiot enough to say: "I wish I had been with you." ROULEZ-BOULEZ.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

FORREST.—The address asked for last week is Forrest & Son, Kelso, Scotland.

R. O'S., St. John.—1. The kennel has some well-bred stock. 2. The wood can be had of J. Coggill & Son, 432 Washington street; J. H. Monteath, 151 Centre street, or Daniels & Co., 202 Centre street, New York.



G., Mt. Vernon, N. Y.—Meteor was by Garnet (Pilkington's Tory—Pilkington's Jessie) and out of Pilkington's Jilt (Viscount Downe's Mars—Lord Sefton's Jilt). Tory by Garth's Drake (Rap—Doll) and out of Moore's Mab, pure edge blood. Jessie by Lord Sefton's Monarch (Manton ——) and out of Lord Sefton's Juno (Sam—Duchess). Mars by champion Drake (Rap—Doll) and out of Viscount Downe's Mite (Lord Derby's Drake—Lord Derby's Daisy). Lord Sefton's Jilt by his Met (Lord Sefton's Beau—Legh's Merry) and out of Peg (Major—Drab).

MABIE, Whitby, Canada.—1. Please state distinction between Wilson, Jack, English and Grey snipe. 2. We have a speckled trout here weighing over 3lbs. Is this a brook trout? If not, what is it and how are we to distinguish them from brook trout? Ans. 1. Wilson's, Jack, English and Grey snipe are local names for the same bird (*Gallinago delicata*). This bird is closely allied to the "Jack Snipe" of Europe, and up to a short time ago was regarded as identical with it. 2. There are but two red-spotted trouts on the eastern coast of America. One of these is the common trout and the other is the bineback trout unless the new fish found in New Hampshire proves to be distinct from the latter. It is safe to say that your fish is the brook trout (*Salvelinus fontinalis*) which grows to 10lbs. weight in Maine.

EXTRACT from letter received by the U. S. Cartridge Co., Lowell, Mass., from Mr. Frank Hart, of J. Heart & Co., bankers, Doylestown, Pa., dated Jan. 21, 1887: "I have about come to the conclusion that your .22 short rim-fire cartridges are the most reliable in the market, and they are beginning to be appreciated by those who know where a bullet ought to go when they pull the trigger." —*Adv.*

The Fluttering Fly.

PATENTED MAY 4, 1886.

THE FLUTTERING FLY. Patented May 4th, 1886.

With the exception of our Patent Compensating Reels and Section Bamboo Rods which we introduce to the public, this fly, invented by Mr. Wakeman Holberton, is unquestionably the greatest and most radical improvement in fishing tackle ever made. The chief points of manifest superiority of this method of tying flies over the old-fashioned way are:

1st—The wonderfully life-like and fluttering motion this fly has when moved on the water.

2d—The fish is almost certain to be hooked if it touches the fly.

3d—Any of the present favorite combinations of color and form can be tied in this way. Thus, those who believe that fish are attracted by particular colors or forms of fly, can have their old patterns in the patent style.

4th—These flies not only offer less resistance to the wind in casting, but more resistance to the water in drawing. Hence one can do as good work with a small hook tied this way as a large hook tied as before. Experience proves that flies dressed this way can be tied on hooks two sizes smaller than one would use on old-fashioned flies.

We take this means of notifying dealers and fly-tyers that we shall prosecute any infringement of our rights under this patent to the fullest extent of the law. Our course, in regard to the protection of our patents and copyrights, is known to some people. We assure such people that the same old course will still be pursued by this firm.

We add a few extracts selected from the numerous and unanimously complimentary press notices of this fly. We could add many letters from well-known and expert anglers if we were willing to drag the names of private gentlemen into our advertisements.

Scientific American: "When so arranged the wings offer less resistance to the air in casting. As the fly is slowly drawn toward the angler the wings expand, and give it a fluttering, life-like motion, much more alluring to the fish."

Forest and Stream: " * * * more like a natural insect than the old patterns whose wings close when being drawn through the water. * * * Great merit lies in its superior hooking qualities. A fish cannot nip at the wings or tail, but swallows the hook before any part of the fly."

American Angler: "There is no question as to the killing qualities of this fly. All fish are attracted more by the action of the fly than by color or form. * * * This fly will certainly, when drawn against the current or over a placid pool, *seam* the surface with an attractive wake, and its expanded wings will create a fluttering motion, assimilating the struggles of a live insect. * * * We are told that few fish are lost by those who use this fly. We do not doubt it."

A WORD IN SEASON.

Readers old and new of the FOREST AND STREAM may be pleased to know that the paper is now at the close of 1886 enjoying the support of a wider circle of friends than at any former period in its history. This is an interesting fact, for it proves, with the best possible demonstration of success, the sound sense of the theory long ago adopted by editors and publishers, and steadfastly adhered to, that there is room in this country for a journal treating the subjects embraced by our departments, and depending for its support wholly upon what have been accepted by the conductors of the FOREST AND STREAM as legitimate journalistic methods. In other words, we have kept faith with subscribers by devoting our reading columns exclusively to honest reading matter, and have not given up our pages to extended paid puffs of railroad routes clumsily disguised as accounts of sportsmen's travel, nor alluring descriptions of wonderful agricultural regions, all paid by the column. The conviction that a sportsman's journal for sportsmen could be conducted without resorting to such questionable makeshift expedients have proved quite correct.

The tone and high character of the journal, as one fit for sportsmen to receive into their homes, will be jealously maintained. As there is nothing in the recreations of field and stream inconsistent with the highest type of manhood, so, the editors are convinced, there should be in a journal like the FOREST AND STREAM nothing to offend good taste.

The FOREST AND STREAM will be, in the future as in the past, thoroughly representative of the best field sportsmanship of America. It will maintain its position as the chosen exponent of those who seek recreation with gun or rod, rifle, canoe or yacht. Its character will be scrupulously preserved, and readers in 1887 may expect a rich fund of sporting sketches and stories, suggestions, bright sayings, prompt, reliable news, and interesting discussions. Angler, shooter, dog breeder, canoeist and yachtsman, may be assured that whatever is of interest in these respective fields in 1887 will find its way into the columns of the FOREST AND STREAM.

The Sportsman Tourist

columns are filled with bright sketches of travel, camp life and adventure, the reflected experience of a host of outers.

Natural History.

Papers descriptive of bird life, chapters of animal biography, notes on the ways of field, forest and water creatures as observed by sportmen, anglers and naturalists, make up these pages. The special work of the past year has been the establishment of the Audubon Society for the Protection of Birds, begun in February, and having now a membership approaching 20,000.

Angling and Shooting.

Time was when a single journal sufficed in this country for adequate discussion of all the heterogenous pastimes and practices dubbed sport. That time has long since passed away Some of the sports have been outgrown or put under a ban, others have developed to such a degree that each class requires a special organ. The particular fields chosen by the FOREST AND STREAM are those of angling and shooting. The pages given up to these topics are rich with the freshest, brightest, most wholesome, entertaining and valuable open air literature of the day. They have the sunlight and woodsy odor of the haunts of game and fish; they picture nature as seen by sportsman and angler. One has not long to read the FOREST AND STREAM before learning its attitude with respect to game and fish protection. The editors believe in conserving, by all legitimate methods, the game of fields and woods, and the fish of brook, river and lake, not for the exclusive benefit of any class or classes, but for the public. They are earnest, consistent and determined advocates of strict protection in the legal close season, and in restricting the taking of game both as to season and methods, so that the benefits of these natural resources may be evenly distributed.

The Kennel.

This department has kept even pace with the growth of the interest of breeding field and pet dogs. Reports of trials and shows are usually given in the FOREST AND STREAM in advance of other publications, and being prepared by competent writers their intelligent criticisms are of practical utility. This journal is not hampered by personal animosities. It has no judges to "kill." It does not decide a dog's merit by asking who the owner is. It treats all kennel subjects without fear, favor or ulterior motives, and in consequence enjoys a degree of public confidence and esteem denied to such as stagger beneath the incubus of malice and flounder in the bogs of ignorance.

Rifle and Trap Shooting

records scores of meetings and matches, discussions of topics pertaining to the butt, gallery and trap. Secretaries of gun and rifle clubs are invited to send their scores for publication.

Canoeing.

This country is a land of magnificent water courses, and Americans are just beginning to appreciate the canoe as a means of enjoying the delectable charms of river and lake, and bay and canal. The men who are making fortunes by making canoes know best how rapidly the ranks of canoeists are multiplying. Novices and old hands will find in the FOREST AND STREAM canoeing columns, in charge of a practical canoeist, accounts of cruises, lines of new craft, and hints and helps and suggestions without number. Closely allied is

Yachting,

in which the FOREST AND STREAM is the only competent, all-the-year-round, intelligent exponent. Our reports of races are full, prompt and accurate. The numerous illustrations of lines of new yachts make an invaluable record of the development of yacht building.

Weekly, $4 per year; $2 for six months.

Forest and Stream Pub. Co., 39 Park Row.

Wanted.

WANTED.—A FEW EXPERT WORKMEN familiar with the building of small steam and sail craft. Must be competent to draught and lay down their own work. Also some No. 1 small boat and canoe builders. The Kennel.

Grand Bon-Secours Kennels.

Near Péruwelz (Hainault), Belgium.

ESTABLISHED IN 1865.

Property of Mr. Aug. Tondreau Loiseau, BANKER AT PÉRUWELZ.

These kennels enjoy a wide-spread fame, and hundreds of sportsmen of the highest authority in the doggy world can bear witness to the scrupulous good faith which governs their operations, and the remarkable merit of many of the dogs which have gone out from them since 1865. The collection consists exclusively of English sporting dogs. Besides a splendid collection of English stud and field dogs—Laverack, Gordon and Irish setters, large and small pointers, Clumber, Sussex, Norfolk and black spaniels, large curly or wavy-coated retrievers, all of the most noted blood—which are employed for breeding and whose young are offered to the public, these kennels always have for sale a large number of other English dogs, warranted to be of pure and noble blood, handsome and good, of full pedigree, thoroughly trained to obey, to charge at the uplifted hand, and to retrieve perfectly all kinds of game.

The kennels are constantly open to visitors.

Adult and trained dogs can be shipped at Antwerp (Belgium) destined for the principal ports of the two Americas.

American Foxhounds.

We have for sale a large number of the best practical foxhounds in this country; trained dogs and bitches and puppies. Prices for guaranteed broken hounds, $50; year old, unbroken, $25; puppies, $15 and $10.

We offer for sale at the following extraordinary low figures the following Swiss St. Bernards:

Rough-coats, stud dogs: Barry I., Hadjar and Alvier at $200, $175, $175. Tromba, young bitch (had a litter of 9, 7 dogs, by Eiger, in Dec.), $175.

Smooth-coats, stud dogs: Wotan, a prize winner, $140; Semaphoic, a very typical, most promising young dog, $230. Bitches: Kader, Tresa, Tamina at $150, $250, $150.

The above is a bona fide offer, made low in order to close out, and is good for January only. The stock is of the very best that is to be had in Switzerland. All the specimens are guaranteed to be as represented, and are sure to make their mark either on the bench or as breeding stock.

Orders booked for a litter by champion Otho—La Duchesse (champion Duke of Leeds—Sheila); a few Hector—Belline bitch puppies left, for sale cheap. THE HOSPICE KENNELS,
Arlington, N. J.

FOR SALE.

Irish Red Setters,

Bred from prize-winning stock. Address JEAN GROSVENOR, Medford, Mass. jan20,4t

AT A GREAT SACRIFICE IF TAKEN AT once.—One pair red setters; one pair English mastiffs; one mastiff male puppy; rough and smooth-coated St. Bernard puppies, all of prize-winning and registered stock. Address with stamp, PROGRESSIVE KENNELS, Flatbush, L. I. jan20,2t

I EXPECT A LITTER OF LLEWELLYN setter puppies about the last of February, by Gun (Gladstone—May B.) out of Pearl Blue (Royal Blue—Dryad). I am taking orders now. For pedigree, prices, etc., enclose stamp to CHAS. YORK, 9 & 11 Granite Block, Bangor, Me.

SMALL IMPORTED PUG DOG SILVER Shoe. The above is a fine built animal, all life and style and very best of points. I limit him to one bitch every fourteen days. Fine puppies for sale (Silver Shoe ex Lady Flora. Particulars and pedigree. JAMES BOWDEN, 631 Hudson st., New York City. jan27,tf

FOR SALE.

Foxhounds—Two dogs, one bitch, 2 yrs. old, thoroughly broken; one Irish water spaniel bitch, 3 yrs. old, good breeder; one English bull bitch pup, 3 mos. old, out of imported stock. Address SHAFER & HULL, Berlin, N. Y. 1t

WANNTED.—A WELL-BRED BLACK AND tan (no white) beagle dog. Address M. W., this office, stating price, etc. jan27,2t

WM. GRAHAM, NEWTOWNBREDA, BELFAST Ireland, is prepared to purchase and ship dogs for importers. Dogs purchased from him had the following prizes awarded to them: At New York and Chicago, 1883, sixteen firsts, nine special, three second and one third. At New York, 1884, seven firsts, six specials and one third.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, FEBRUARY 3, 1887.

VOL. XXVIII.—No. 2. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications on the subject to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by express money-order, registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. For sale by Davies & Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Davies & Co., and Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, London, Eng. Foreign subscription price, $5 per year; $2.50 for six months.

Address all communications,

ANSWERS TO CORRESPONDENTS.

THE NATIONAL PARK BILL.

ONE stage in the fight to save the National Park has been passed, and a victory won. The result is so decided and affords so much promise of ultimate success, that all who are engaged in the struggle should take heart and be inspired to renewed efforts. On Saturday last Senator Vest's bill (Senate 2,436), providing for the care and government of the National Park, passed the Senate by a vote of 49 to 8. The debate on the bill was long, many Senators desiring to express their views on the importance of the measure. The overwhelming majority by which it was passed shows very clearly that the United States Senate thinks with the people on the subject of the Park.

The bill was amended in only one particular of importance. This was in the direction of more carefully guarding the rights of persons accused of crimes and misdemeanors, and gives those sentenced by the Commissioner to imprisonment the right to appeal to a district court of the Territory of Wyoming.

The cutting off of two miles and a half on the north side of the Park and of half a mile on the west had no hidden object, but was done merely to bring the whole reservation within one Territory, and to avoid jurisdictional conflicts.

The success of the bill in the Senate is due almost wholly to the energy and dogged persistance of Senators Vest and Manderson. For years they have struggled against discouragements and defeats in this matter of the Park, but they have declined to be discouraged or defeated. All the while public interest in the Park has been growing. First the people and now the Senate have come over to their side. We hope that the House is prepared to do the same. The House of Representatives should at once take up the bill and pass upon it. The time is short in which to accomplish anything. Only four weeks of the session remain, but the bill will accomplish so much, is so evidently for the benefit of the whole nation, and is so wholly without objectionable features that it should certainly receive the immediate attention of the people's representatives, and go through without a dissenting voice.

At present the Park is without a government. There is no law there, no provision for the safety of the lives and property of those who visit it, nor any protection for the wonderful natural curiosities which exist there, for the forest nor the game. This bill provides everything that is now lacking. Its passage will give the Park a government, will enable the 10,000 tourists who annually visit it, to do so with safety to life and property, will furnish a force of men to carry out the regulations established for its proper protection and will save the forests, the game and the geysers from the speedy destruction which now threatens them.

By saving the forests, which keep full the sources of the rivers which rise within its borders, it will be the salvation of the farmers who cultivate the arid plains on either side of the mountains. Without some measure which shall protect these stream heads these farmers will be ruined, and a fertile region be converted into a desert. A year's delay in passing the bill will work damage which will be irreparable. It should go through at this session. Chief Justice Waite, of the Supreme Court, puts the case tersely and forcibly when he says of this bill, "It seems to me to meet the requirements of the case. To accomplish what is needed there must be a government, and I do not see how any less than is provided for can be made sufficient. If it is worth while to have the Park, it is worth while to see that it is preserved for the purposes for which it was intended. It should either be abolished altogether and be permitted to go into the hands of private owners for the purpose of extortion, or else it should be kept as a national institution and cared for as such."

The bill now goes to the House and will probably be referred to the Committee on Territories. The fact that it was so fully discussed in the Senate, and that after this full discussion it passed that body by such an overwhelming vote, should insure its prompt consideration by that committee and an early and favorable report on it. It remains then to be seen what action the House will take. The bill has the strong support of all of those who are best acquainted with the needs of the reservation. Its passage will not only save natural wonders which are sure to be destroyed unless it becomes law, but will also be an actual economy of money to the Government, for the maintenance of the troops in the Park costs a great deal more than would be expended under the operation of this act.

No effort should be spared to carry the bill through the committee and to the House at once, and every one who is in the slightest degree interested in the preservation of this wonderful region ought to do his part toward helping forward the bill. A little neglect now may cause a year of waiting, another anxious time and irretrievable loss.

A SUPERINTENDENT OF PROTECTORS.

THE working of the New York system of State game protectors is of more than local importance. Other States are regarding the experiment with interest to see whether its success warrants adoption of the plan. It must be confessed that as at present conducted the system does not accomplish all that it ought to. This is owing in large measure to the official delinquencies of the protectors. These delinquencies are possible in some instances because the officials are not accountable to any head. The system is not complete. Having appointed these wardens to watch poachers, the State must now appoint a superintendent to watch the wardens.

As things go now, a State game protector is not accountable to any superior official. He may be guilty of grossest neglect of duty, yet draw his salary with regularity and equaminity. The Commissioners of Fisheries are ostensibly to exercise supervision over the protectors, but the Commissioners have not the time to devote to the work, and being unsalaried, they perhaps cannot justly be asked to give more than their present perfunctory service. What is needed is an energentic, interested superintendent. The bill introduced at Albany last session making provision for such an office should be revived at the present session and passed.

IT will be remembered that a year or two ago the Maine Supreme Court decided that in common law a dog was not a domestic animal, but must be classed among the *ferœ naturœ*. A bill has been introduced into the Maine Legislature to give the dog better standing. The bill is said to be the shortest one ever introduced into the Maine Legislature or any other. Its full text is this: "Sec. 1.—The dog is hereby declared to be a domestic animal. Sec. 2.—This act shall take effect when approved." The Legislature will do itself credit by passing that bill.

WARY BIRDS.

THERE are knowing birds who are not to be taken with any device of the fowler. They have too often barely extricated themselves from the snare and do not mean again to let their feet be defiled with birdlime. In his efforts to spread the AUDUBON SOCIETY movement, the Secretary has here and there come into contact with agricultural residents, possessed of wariness of a high degree of development. They have presumably been "worked" by the genuises who make a specialty of getting a farmer's signature to an agreement to receive some sort of a present, and then by mysterious processes, best known to themselves, convert the agreement into a note which takes all the astonished and unhappy signer's spare greenbacks to cash when pesented to him by the county bank. The victim who has been taken in and done for by such sharpers does not propose to let any New York city chap come it over him with so transparent a snare as a pledge not to destroy useful birds. Once in a while the Secretary receives an intimation like this from Wisconsin:

> It is hardly fair to ask people to pledge and doubly sign their names without any responsible names, even singly given, to guarantee the pledge-signers against foul play. We are advised by nearly all our local papers not to sign our names to papers presented by strangers by reason of liability to find them attached to something not intended to be signed. In the present instance I have no authority nor indeed ability to guarantee the signers to the pledges that they shall receive no harm for their good intentions. The Forest and Stream Pub. Co. I have no doubt are reliable and I see their periodical often quoted from in other papers, but no responsible name has come to me from them, * * and if any one is harmed curses will follow and perhaps prosecution. * * * Hoping that confidence and esteem may be strengthened between us I am yours with respect, ——."

SNAP SHOTS.

BY a note printed in another column it will be seen that the course pursued by Game Protector Godwin is such as to commend itself to the Commissioners of Fisheries. It appears that from the very first Godwin was cognizant of the extensive illegal traffic in ruffed grouse in this city, and it is to be inferred from his letter to Mr. Blackford that he at once took reasonable action to suppress that traffic. The contrary is true, however. Godwin did not bestir himself until after his delinquency had been adverted to in these columns. His "proclamation" to dealers to stop the sale of grouse did not appear until fourteen days after the season had closed. That this sort of masterly inactivity is acceptable to his superiors may be lucky for Godwin, but it is certainly discouraging to such as believe that the only reasonable way to enforce game laws is to enforce them.

It gives us great pleasure to publish from Game Protector Lindley his account of work carried through in his district. We have taken occasion in the past to commend Mr. Lindley's energy and fearlessness. In view of this record, it is all the more unfortunate that by neglecting certain gross violations of the law, though repeatedly brought to his attention, he should have merited the criticisms we recently made. If Mr. Lindley's contention that his field is too big for one be well founded, then the State should furnish assistance. Mere statutes cannot protect the fisheries of inland New York lakes; there must be an adequate force of officers. The Commissioners of Fisheries are empowered to detail other protectors to work in any given district; and if Mr. Lindley needs help he should have it from the Commissioners.

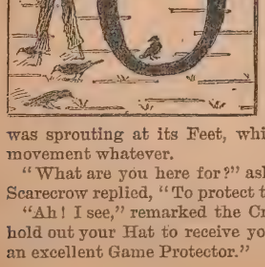
The thirteenth annual dinner of the Massachusetts Fish and Game Protective Association, at Boston last week, was the occasion of a very pleasant gathering. The addresses of Lieut.-Governor Brackett and President Boardman of the Senate, gave ample evidence of the public appreciation of the character and work of the Association and the place it holds in the estimation of the executive and legislative departments of the State. The Association contemplates no attempt to change the game law this year, but will use its best exertions to hold the present law intact.

In connection with the international fisheries disputes it may be remarked that the Canadian authorities made a blunder when they appointed Capt. Quigley to the command of a Dominion cruiser. Among the Blue-noses Quigley is generally known as a crank. To put such a man in his present position was unwise and impolitic.

A NEW CREEDMOOR.

THE Directors of the National Rifle Association have set about the work of transplanting Creedmoor to a spot where it will not die of neglect. The move comes none too soon. The old Queen's county range is magnificent for its purposes. No such lawn exists anywhere the world over as a pathway for bullets. But it is doomed none the less because it is out of the track of travel. It is a toil and a tax to get there, and the pleasure and profit do not compensate for the outlay. The vicinity of the metropolis has been well canvassed. Lieut. Zalinski, U. S. A., of the Board, has been a persistent worker in this regard, and he has discovered a plot of 100 acres on Staten Island, where a range he thinks may be established. A cost of 30c. for a round trip ticket and a lapse of half an hour land the visitor within pistol shot of the proposed firing point. Behind the targets that are to be, stretches the shoal waters of New York Bay. Those shoal waters are navigated by fishermen who go out for a day's pleasure on the bay and would not care to undergo a bombardment. Then, too, it is important, if not imperative, that the targets shall bear away to the north from the firing points, so that the rising or the setting sun may not dazzle and blind the marksman. These and other points will be made clear when the surveyor's map shall be placed before the Directors at their next meeting.

Some there are who feel a bit of sentiment for the mother range at Creedmoor, who think that it would be a pity and something even of a rude shock to leave the name behind when the new spot is taken as the range of the future. Perhaps it would be a good idea to carry forward the name in some way, to at least embody in the new some reminder of the old range.



With the new range so convenient as is claimed, it is to be hoped that the military authorities who manage the movements of the guardsmen of this city and Brooklyn may see their way clear to make a more efficient use of it than has been the practice at Creedmoor. Rifle shooting skill is after all a matter of individual skill. Why not, then, recognize this fact in the use of a range, instead of getting the men together in uniform and sending them down in bodies to fritter away a great deal of time and effort in useless formalities and evolutions? Why not arrange it so that each soldier may go down as best suits his convenience, out of uniform if you will? And when he reaches the range, let him find there a shooting master, one who will give his individual attention to the individual soldier, and then something may be done. If a man is never to become a marksman, nor even a tolerable shot (and there are such), the shooting master will soon find it out, and that soldier may be invited to a place among the non-combatants. Some require more teaching than others, and they would get it. A shooting instructor, paid for his services and carefully chosen, might be in attendance on the range five months during the shooting season, and every one of the men in the two brigades, properly identified, could get such advice, coaching and instruction as his condition demanded.

The Directors hope to see a revival in the popularity of the sport. The endeavor will be to make the new range a resort where all may go for an outing, and where such as wish may shoot. Millionaire Austin Corbin chose to choke Creedmoor out of existence. Millionaire Erastus Wiman steps in to clear the way for the new National range, where perhaps the opening days may see an international match by Mr. Wiman's fellow-countrymen from Canada against a team from the United States, or perhaps the Queen's birthday may be remembered on this side by something of an appropriately like sort.

IT WOULD BE a great mistake to license a single big-gun on the wildfowl waters of Virginia. The intelligence that a scheme of this sort is on foot may well be received with alarm by every resident of Virginia, and every visitor to its coast shooting resorts. The newly organized Virginia Field-Sports Association should give this their attention, and make it their first business to see that the big-gun schemers are balked.

A "FOREST AND STREAM" FABLE.

The Crow and the Scarecrow.

ONCE upon a time a Crow, approaching a Corn Field, beheld with terror a Scarecrow of most frightful Mien standing in the middle of it, but coming nearer to it and pulling a few spears of young Corn in the Edge of the Field, saw that it made no movement to stop his Pillage. Then he ventured quite near it, and at last pulled a Hill of Corn that was sprouting at its Feet, while the Scarecrow made no movement whatever.

"What are you here for?" asked the Crow, to which the Scarecrow replied, "To protect this Field of Corn!"

"Ah! I see," remarked the Crow, "and if you could but hold out your Hat to receive your Salary, you would make an excellent Game Protector."

The Sportsman Tourist.

UNOFFICIAL LOG OF THE STELLA.—II.

JEKYL ISLAND, Ga., Jan. 16.—It was not until the 9th of January that we scraped the Charleston mud off our shoes and steamed away for Tybee Roads by the inside route, for the breakers on the bar were too savage for small craft, and our pilot feared a capsize.

Our memories of the much cracked city will not rate among pleasant reminiscenses. We don't complain of the slight shock in the earthquake line which rocked us gently on the morning of the 5th. Nor do we blame the place for the abominable weather, which was one continuous freezing drizzle for the entire five days of our stay. And it was nobody's fault that we had to go on the dry dock for a new condenser, the old one having broken down completely. But we were forced to put in coal and water; and the coal was wet, dirty stuff, at $7 per ton, while the man who furnished water presented a bill for 700 gallons. As the Stella's capacity is only 375 gallons, the Skipper demurred strongly, but could only get the bill reduced to 600 gallons. The charge of $25 for docking the yacht was more than double New York charges. This the Skipper endured with equanimity; but when we were ready to go and the dry dock man presented his bill for another $25 on the ground of "lay days," he was inclined to kick. It was of no use, however, and he paid the bill, more in sorrow than in anger, I think. What added to the grievance was the fact that, in raising the yacht, they had cramped her so her doors would neither open nor shut. As the locker which held our fluids happened to be shut we were on the dry dock in a double sense. The Skipper worked at the door for an hour trying to burgle into his own locker, but it was solid and fast. As he desisted from his efforts and put away the chisel he had been using, he indulged in remarks like this: "I don't approve of earthquakes as a principle, but given the necessity and granting that it is inevitable, can't help thinking that it made rather a sensible selection."

It was well, on the whole, that we were forced to take the inside route. In going outside you have a waste of tumbling waters on the port beam, and on the starboard a thin ribbon of white sand beach topped with a dark fringe of green-black pines. This and nothing more. On the inside route you pass through the country with a variety of changing scenery. Cotton and rice fields, swamp, marsh, creeks, inlets, sounds and bays, with isolated dwellings of all degrees, from the negro cabin to the pine palace of the planter, with here and there a village or small city. You are also constantly meeting tugs, rafts, small sailing craft, and all styles of small boats. All the rafts and most of the open boats and barges had fires burning on a bed of sand, around which the darkies were huddled with outstretched palms, for the weather was bitterly cold and they were miserably clad.

Just at dark we came to anchor near the mouth of the North Edisto, and all hands had a night watch below.

Got under way at 8 A. M. on the 10th and had a fine day's run to Tybee Roads, anchoring after dark in Broad Creek, which is a safe and pleasant anchorage.

The morning of the 11th was pleasant with light winds, and we stood out to sea for an outside run to Brunswick, or, rather, Jekyl Island. It proved the pleasantest outside run of the cruise. All day the sea was smooth and the skies bright, and all day the Stella pegged away rapidly at the knots, picking them up in a quiet, effective way, that brought us opposite the club house a little after sundown, where we let go our anchor and saluted the club yacht Howland, according to the code in such case made and provided.

Jekyl Island is historical ground. In *ante bellum* days it yielded a large revenue in sea-island cotton and slaves, and in the olden time was a favorite port for slavers, which could run in around either end of the island, and in case of pursuit by a government vessel, could easily get away by one channel while she was entering by the other. It was on this island that the yacht Wanderer landed the last cargo of negroes ever landed on American shores, and some of their descendants are still living on the island. The Du Bignon family then owned the island, and it was to the elder Du Bignon that the cargo was consigned. The landing was successful, and the Wanderer was turned adrift to be picked up by a revenue cutter, as slavers are occasionally disposed of after a successful middle passage to the Spanish West Indies, even to this day.

These were golden days for the owners of the island; raising slaves and sea-island cotton for market was coining wealth, and the Du Bignons could live in baronial style. It was not a healthy place for New England Yankees and abolitionists, and none came near the island, save in government vessels. The war changed all this. Slave property melted away before the emancipation proclamation like a June frost, and raising sea-island cotton without slave labor was not a success. The owners of the island fell into a state of decadence, and the descendants of the Wanderer's cargo came to the front. They did not care to labor, they had had enough of that. And for a while they did little but fish, hunt and bask in the sunshine. They swarmed on the island and virtually took possession thereof for a time. The Du Bignons had secreted a large quantity of the very best cotton which they succeeded in keeping until it was worth $1 per lb., and this helped out for a while. But the island ceased to give a revenue, and the family shared the usual fate of wealthy slave owners—they became poor.

The island was worth little to sell and less to keep, save as a game preserve. For agricultural purposes it would not sell for much more than government price; but, as daily happens in the South, Northern men and Northern capital came to the rescue. A party of rich Northerners formed a club and purchased the island at a cost of $125,000.

Jekyl island contains about 14,000 acres, and is well stocked with deer and turkeys, with an abundance of wild hogs, wild cattle and even horses. The Jekyl Island Club proposes to kill off the hogs and cattle and give the deer a better chance, and also to stock the island with quail, a project which may succeed if the quail do not prefer to leave for the main land, as very likely they may. I much doubt if they will find the requisite food here; and I could not repress a rather broad smile at the proposition of one gentleman, to sow buckwheat at various points on the island to "feed the birds." I hope he may live to see a bushel of buckwheat raised on any island between Savannah and Key West. When that happens we shall raise fine crops of bananas on Cape Cod.

A fine club house is in process of construction at a cost of $50,000, and the brick walls are already up to the fourth story. This, with the club yacht and other etceteras will bring the cost of the plant well up to $200,000; and an old woodsman finds it difficult to see why there is more genuine sport in it than in an inexpensive bark camp among the dense forests, and by the cool, clear springs of the Upper Susquehanna. But there is no doubt as to its exclusiveness, and I do not care to moralize. The club has treated us with genial cordiality, gave us the freedom of the island for shooting, and helped forward our views in every way. And if they choose to spend a quarter of a million on shooting grounds and club houses, why they have got it to spend, and the money goes to those who most need it.

The Captain and the Scribe have been out several times ostensibly to hunt deer, though the Scribe does not believe in a deer hunt that commences after a 9 o'clock breakfast. His wood lore leads him to prefer being on the ground as early as a man can see his sights.

The Captain, however, succeeded in shooting a couple of wild pigs, which, instead of being red, lank, big-headed, bristly specimens, looked wonderfully like plump, well-fed Berkshires. And the Scribe, who had laughingly offered to skin all the pigs the Captain could shoot, found himself in for a job. Did you ever skin a pig, or a bear? If so, you know how it is yourself. The skin will not peel, but must all be cut off with a sharp knife, inch by inch. The Scribe came to time, however, and was rewarded by a square meal of roast pig, fat, tender and delicious, with a distinct gamy flavor. All hands pronounced it an improvement on the domestic article, and the Scribe is ready to submit his testimony that wild pork is superior to venison.

A notable feature of the club grounds is a fine artesian well which gives a constant 4in. stream of pure, clear water, looking, as it runs off in its channel of white sand and white shells, very like a Northern trout stream; but it is only in looks. The water has a temperature of about 80°.

Very pleasant is this loafing and loitering a-down the coast, only if the weather would grow warmer. Last night (the 17th) there was a furious norther and the Stella dragged her anchor, though in a landlocked channel. She was brought up by the best bower, and this morning her decks are again slippery with ice. The Reva (P. Lorillard's yacht) came to anchor here on the evening of the 16th, and the Magnolia is expected hourly. The southward bound yachts make haste slowly, and the Stella is no exception. We have been here a week to-day, but shall go, as soon as the norther lets up, for Fernandina and St. Augustine. NESSMUK.

A TRIP TO THE NIANGUA RIVER.

ONE bright October morning, a party of four left their home on the bank of the Missouri River, near the central part of the State of Missouri, on a hunting and fishing expedition to the southern part of the State. Our conveyance was a covered spring wagon drawn by a span of mules that would take us over any road. George carried a Richardson shotgun, Charlie a Remington shotgun and Ballard rifle, and I a Parker. Our camping outfit was complete, and as we rode along we talked cheerily of the trip before us. We traveled east along the bank of the river for a few miles, then turning south crossed the little Saline River and a strip of prairie eight miles wide, and came to the Moniteau River, where we stopped for dinner and a little rest. At Tipton we crossed the Missouri Pacific Railway and following the road due south arrived at the Moreau River early in the evening, where we camped for the night. We saw some game during the day, but had said we would not fire a gun the first day out. At supper we cleaned up about all the lunch, so it was a case of necessity to catch or kill something for the next meal.

In the morning Charlie and George went after squirrels and I tried the stream for fish. In a couple of hours I caught twenty small sunfish and one half-pound bass. While I was cleaning the fish the boys came in with three squirrels and one pigeon. All was soon prepared for the pan, and when cooked we sat down to a royal feast.

From this point to Versailles, the county seat of Morgan, the country is rolling prairie, and we passed many fine farms and herds of cattle. Rabbits and quail were abundant, and some of the latter were knocked over for future use. At Versailles we leave the prairie and come almost at once into the Osage hills. The timber we pass through is chiefly oak, there is scarcely any underbrush, and the woods have the appearance of a cultivated park. A hard, flinty rock seems to be every where, and it was a matter of wonder to us how such rocky soil produced fine timber and grass.

We camped that night on the bank of a little stream called the Proctor. Just before we reached there, a gang of turkeys ran across the road ahead of us, but we could not get a shot. Charlie marked the spot, and I knew the dawning of the morning would find him there. The next morning, finding the Proctor too muddy to do any fishing, I went after squirrels. A quarter of a mile to the south was the Osage River, and to the north a short distance was a ledge of limestone 100ft. high, which extended along the valley for some distance without a break, except where the Proctor came through. It was a fine morning, and the squirrels were out in full force to enjoy the fresh air and their breakfast of hickory nuts. I was sorry to break in upon their picnic, but we had to have something to eat.

When I reached camp the boys were already in, bringing with them a fine young turkey which George had shot.

After a hearty breakfast of our own providing, we were once more on the road, which led through the valley for a short distance and then up a steep hill a mile long. Gaining the ridge we found we were in one of the numerous horse-shoe bends common to the Osage River. At the foot of the hill on the right, the river ran directly west and on the left directly east. Following the ridge for a few miles and down a long hill, we came to Crittenden, a little town named in honor of the Governor of the State, where we were taken across the Osage in a flat boat.

Eight miles further on we came to Bollinger Creek, where we stopped for dinner. A little way from here is located the Osage Iron Works, which was in a flourishing condition years ago, but the men got on strike and let the iron chill in the stack, and the furnace has not been started since. The company own two thousand acres of land and a lot of dilapidated houses; the land has several veins of coal and iron and any quantity of limestone.

At 5 o'clock we arrived at the Niangua (Nee-ŏng-wä) River, and put up our tent close to the dam opposite Arnholtz's mill. Anxious to have fish for supper, two of us started fishing at once and succeeded in catching some small catfish and white perch. About dark it began to rain and continued nearly all night, which raised the river three feet and made the water quite muddy. The next morning, finding the ford looking rather dangerous, we got a boy to pilot us across. Arriving at the mill we found the proprietor, Mr. Geo. Arnholtz, sitting on a millstone hammering away. This jolly Dutchman has lived here for forty years and is well-known for miles around. We explained to Mr. A. that we had come to hunt and fish for a few days, that we had got pretty wet the night before and wanted a dry spot to sleep on. Mr. Arnholtz had a room in the mill which contained a cook stove and bed, that he said we could have as long as we wanted to stay. The room suited nicely and we soon had our traps unloaded, fire built, clothes dried and everything in good shape. After dinner Charlie and George took to the woods and I fished all the afternoon, taking one bass, two white perch and a lot of small catfish. The boys brought in several gray and fox squirrels.

During the afternoon a party from Versailles had come and camped in the school house. They brought trotlines with them, and I noticed they selected the swiftest deep places and set the lines slanting across the river. In the evening Mr. Arnholtz came down to chat with us for a while. As he kept a pack of hounds and had hunted deer for many years, his talk was very interesting to us. Before turning I took a look at the hand-lines, and was much pleased to land a channel cat weighing 7lbs. In the morning the Versailles party brought in over 100lbs. of fish, one channel cat weighing 53lbs., another weighing 30lbs.

To-day we visited a famous cave about half a mile below the mill. A great many stories are told about this cave, and we were anxious to see what had furnished a hiding place for horse thieves, bushwhackers and wild animals in times past. The entrance to the cave is about 50ft. above the river, and is quite narrow. For a short distance inside, the floor is wet and slippery, but further on it is hard and dry. We passed through numerous rooms and halls, until we had gone fully half a mile—our guide told us we could go two miles, but we had had enough and were willing to return to the outside world again. Many of the passage-ways were only two or three feet high and quite narrow, allowing only one person to pass at a time, while the rooms were very large around and from 30 to 50ft high. Almost the entire roof and floor was covered with stalactites and stalagmites, and when the cave was lighted up it formed a beautiful and interesting sight.

Returning to the mill we soon prepared dinner, which consisted of steaks from the 53lbs. catfish, squirrel, fried onions, potatoes, pickles, Halford sauce, canned peaches, bread, butter and coffee. After dinner we secured an old scow and started up the river. The channel was narrow and the hills high and abrupt, giving one an idea of being shut in. We came to another cave said to be connected by a narrow passage with the one below the mill. We took their word for it.

A couple of miles up, we ran the scow aground and took to the woods after game. We hunted about two hours, bringing back a few squirrels and an owl. Once more afloat we soon arrived at the mill. The next morning we bade good-by to Mr. Arnholtz, and continued on our way. Seven miles from the mill we came to Linn Creek, the seat of Camden county, and crossed the Osage a mile above town and just below the mouth of the Niangua. We had considerable sport during the day. Quite often a squirrel would run across the road in front of the wagon, and away we would scamper after it, falling over rocks and brush, all the time trying to keep our eyes on the picture, until the game was treed, then the firing began and lasted until there was a dead squirrel. We kept this sort of thing up pretty much all day. As one of the boys said, "It beat still-fishing all to pieces." We reached the Little Gravois River late in the evening and put up our tent near the stream. At dawn in the morning I was off to the river fishing, while the others went hunting. I caught several small jack-salmon and one bass.

While we were eating breakfast a gang of turkeys walked across the road about 100yds. from camp, in plain sight. The idea of getting a shot at turkeys drove hunger away instantly, and dropping knives and forks we took our guns and started off in different directions. I had been out about twenty minutes when I heard two shots in quick succession. Stepping behind a bush I pulled both hammers back and waited, hoping that fate would send the turkeys my way, and after waiting a quarter of an hour I concluded they had crossed the river and I might as well return to camp. About half way I found Charlie sitting on a log with two turkeys beside him. I was a little provoked that he should get two and I none, but before I had time to explain my feelings Charlie picked up one of the turkeys and told me to take the other and go around and come into camp from the direction I took in starting out. George did not even ask, but took it for granted that we had each shot a turkey, and he does not know to this day but that I killed the one I brought in that morning.

On the road that day we played the same game with the squirrels that we did the day before. It was lots of fun for us. At a farm house we traded one of the turkeys for bread, milk and onions. That night we camped at the mouth of the Big Gravois, and a few yards from the Osage. The Osage is a half mile wide here, and at this time was very high, backing its muddy water up the Gravois for nearly a mile, beyond that the Gravois was clear and afforded us some fine bass fishing.

Ducks and squirrels were abundant and we did not have to work very hard to get enough to eat. We stayed here three days enjoying ourselves completely. The fourth morning we were up and had breakfast before daybreak. The packing up was done in a sorrowful manner, for we all regretted to leave this beautiful place. But once on the way we forgot the blue waters of the Gravois and the muddy Osage, in the anticipation of the bird shooting we were sure to have when we reached the open country again.

About 2 o'clock we were well out on the prairie, and coming to a nice camping place concluded to stop for the day. We were once more among the quail, plover and prairie chickens, and after a hasty dinner we all struck out across the prairie. I walked for an hour without getting a shot, and was returning to camp when I saw a flock of mallards drop in a pond quarter of a mile away. I crawled within twenty yards of the pond, then showed myself, and when the ducks rose I let go both barrels into them and scored nothing; not even a feather dropped. I could not account for the miss, as it was as fair a shot as I ever had. Much disappointed I started toward camp. On the way I saw another pond off to the right, and following the swale leading up to it I was soon peeping through the weeds across the water. Almost the first thing I saw was a mallard drake sitting on a little island about twenty yards away. I looked carefully to see if there were any others and came to the conclusion that this was a lone duck. As the result of the afternoon's sport (?) had been 0, so far; I resolved to take this lone duck "on the wing." Shoving the gun through the weeds I took deliberate aim at the sleeping greenhead and banged away. In an instant there was a terrible splash and flopping of wings and about forty mallards got up so flustrated that they flew in every direction. The sudden and unexpected noise fairly frightened me, but in a second or two the hair lay down on my head again, and I had sense enough left to let go the other barrel into the thickest of the flying ducks, dropping three of them. Gathering up the four greenheads I struck out for camp feeling pretty joyful over my luck. We had quail for supper, something we had not eaten before for several days. Just as we sat down the sun went to bed, pulling a bright red blanket over his head. Clumps of trees and herds of cattle dotted the prairie in every direction, and away off to the south a dark line of timber showed where the Osage hills began. It was a pretty sight, but what interested us most just at that time and added so immensely to the picture were the few feet of ground directly before us upon which our supper was spread.

For the next few days we traveled across strips of prairie and through belts of timber, stopping as often and as long as we wished wherever we found game. All through this country the quail shooting is excellent; prairie chickens are rather scarce but there are enough to afford some sport. There are thousands of rabbits, and ducks and geese are quite plenty during the winter months. These last stay on the sandbars in the Missouri River at night and in the day time resort to the corn and wheat fields on each side of the river, often flying as far as thirty miles to feed. As we neared home we were reminded of corn husking and other work to be done on the farm, and we would have to sit down to tame food again—such as pumpkin pies, ham and eggs, hot biscuits and honey, apple dumplings and cream as thick as your finger; but Charlie "'lowed we would have to stand it—for a while." JACK.

THE TERNS OF MUSKEGET ISLAND.

FROM time immemorial Muskeget Island has been a famous breeding place for terns and seagulls. Over its iron shores the herring gull and the blackback hover in winter, and sometimes the great white-winged gull, wandering from the ice-laden ocean of the far North, stops here for a little while. But in spring, when the leaden clouds have left the sky, and the smooth sea shines brightly blue under the serene heavens, when the shoals of fish begin to move northward, and the hardy fishermen prepare their nets and push off their boats from the shore, then the terns, joining the advancing army of bird life, come to us from the south, and revisit their summer home at Muskeget. And what thousands of them there are. How they circle and whirl and dart about the island; or go off in little fishing parties out to sea, or along the shore, or at midday roost at ease upon the black rocks, which are turned to white by the downy plumage of the beautiful birds.

They are innocent little things, doing no harm to any one, and in fair weather serving a useful purpose by often guiding the fisherman to the distant shoals of mackerel or menhaden, while, in foul, the clamor which they make about their rock-bound home warns the sailor of the neighborhood of a dangerous coast. One would think that the terns and the gulls might live here in peace, but it is not so. The hat bird butcher wanted their skins, for women will have terns to wear. So he went to Muskeget when the birds were breeding, and the ground was covered with their eggs, or with their helpless downy young, and began his slaughter. For years, too, he kept it up, until the birds became sadly reduced in numbers.

Not very far from Muskeget Mrs. Richard P. White has her summer home. She is deeply interested in all animals, and when she learned of the butchery of these sea birds which add so much to the attractions of life on the shore, she put forth every effort to have it stopped. Often at the sound of a gun she would hurry from the house, and stepping into her light boat, would row over to the island to remonstrate with those who were killing the birds. But this after all did but little to put an end to the destruction. So a year ago last autumn she spoke to Mr. Isaac Folger, a gentleman living in Boston who is greatly interested in birds, and he expended much time and effort in trying to persuade the Massachusetts Legislature to pass a law prohibiting the destruction of the terns up to the first of October each year. Such a law was passed, and this was thought to amount practically to an entire prohibition, for the terns by the first of October are supposed to have started on their journey southward, but it is said that last autumn they did not leave the island until the middle of the month, and that before they started great numbers of them were killed.

But it was not enough to secure the passage of this law. The island is some distance from the mainland, and it was evident that some one must be at hand to see that the law was enforced. So Mrs. White and Mrs. Wm. Appleton, both of whom are vice-presidents of the AUDUBON SOCIETY, contributed a liberal sum of money to pay a man for watching over the birds. This he has done, and it is thought that during this past summer, for the first time in many years, the terns were allowed to rear their broods in comparative peace.

Mrs. White gives some account of the cruelties which are attendant upon this needless and wholly inexcusable killing. A reliable man who stopped at the island on the day following a visit of the butchers, counted and killed on the ground, sixty birds which were so badly wounded as to be beyond hope of recovery.

Of the number of adult birds slain here no estimate can be formed. To count the birds by thousands would not give an idea of it, we are told. The slaughter amounts to tens of thousands of adults, and besides these, how many nests of starving young and of deserted eggs. And all this destruction went on so that a few women might wear pretty birds in their hats.

It rather shakes one's faith in the tender-heartedness of woman, does it not?

AN OFFICIAL EXTERMINATION.

Editor Forest and Stream:

In your issue of Jan. 13 you reprint from the Proceedings of the National Museum the account by C. H. Townsend, Agent of the Smithsonian Institution, of what must be judged from the narrative itself to be the final and complete extinction of the California sea-elephant.

It is interesting to know that the National Museum has by Mr. Townsend's expedition secured specimens of this rare animal and that the biologists and naturalists of the future will not be left quite so badly off, in regard to it, as they are to the rhytina, the dinornis, the dodo and the solitaire, not to say the great auk. This is, however, the only consolation permitted the casual reader of this account. Nothing more cold-blooded, remorseless and heartless has fallen under my notice for many a day. We have been treated of late to many touching appeals for mercy to the few remnants of once mighty tribes of living beings. We have been told with what senseless fury the inhabitants of a region in France, who had discovered a family of beavers living on an island in a river—the species having been supposed to be long ago extinct—fell upon and slew every one instead of, as one might have hoped they would be wise enough to do, taking all possible pains for their preservation. We have been led to believe that it was only heartless pot-hunters or ignorant and thoughtless people who were guilty of exterminating game, but in this account we are treated to something novel, viz., the story of deliberate and, so to speak, "official" extermination of the sea-elephant. The expedition was undertaken under the directions of Prof. Baird. The search continued for two months and included every place where sea-elephants had been seen or heard of in recent times, though it was already pretty well known that there was only one place, a lonely beach on the peninsula of Lower California, where there was any hope of success.

Says Mr. Townsend: "Thirty or forty years ago the sea-elephant was found in many places on the coast between Santa Barbara Islands and Cape St. Lucas, but continual persecution has almost exterminated the species." In view of what follows of Mr. Townsend's own action one can but wonder what meaning he intends to give to the word "persecution." After giving an account of the expeditions of oil hunters during the last few years, and telling how the last ship but one killed ninety-one sea-elephants, but left "a few females and young undisturbed," and how the last ship, arriving a month later, "and, finding no large animals, killed the females and young animals spared by the crew of the former vessel—forty in all," he goes on to state how his own schooner arrived at the beach and found three young sea-elephants. "After unsuccessful searching elsewhere, returned Nov. 18 and killed a female, the only animal on the beach. After another trip as far north as San Diego, returned again Dec. 31 and found fifteen animals, all of which were carefully preserved and are now in the Smithsonian Institution." After this cool statement of the final tragedy, without a word of explanation or palliation of his own act, this narrator goes on to say, "From this it would appear that this interesting and valuable animal has heavy odds to encounter in its struggles for existence. No sooner were the three hundred or more that had appeared during the years of their seclusion discovered than they were speedily made away with. That a pretty clean sweep had been made of them was evident from the meagre results of our own careful search, during which we not only inspected the coast line, but circumnavigated the islands of the region both large and small."

Here then we have the full story. This trained man of science, ostensibly working in the interest of science, actually commits, with all possible deliberation and full understanding of his deed, the very act which all science and all humanity should deplore, the final extermination from the face of the earth, so far as himself and all others can judge, of what he himself calls "an interesting and valuable animal." I submit that the like of this story has not been encountered of late, and that unless there are parts of it published in the original "Proceedings" but not given in the FOREST AND STREAM, and which make some attempt at justification, the whole affair is abhorrent to every right-minded reader. Out of sixteen animals found after the most exhaustive search, just sixteen were slaughtered, not even a single pair of them being spared for the possible continuance of the species. If by any chance any straggler has been omitted, no thanks to Mr. Townsend. One wonders if in all this he were only living up to explicit instructions of the august head of the Smithsonian Institution. C. H. A.

BOSTON, Jan. 29.

WHERE DO MEADOW LARKS WINTER?—The communication of "J. H. D." in FOREST AND STREAM of Jan. 20, telling of a great flight of meadow larks on the eastern shore of Maryland last fall, has just caught my eye, and reminds me that not three weeks ago while looking from the car windows near Princeton, N. J., I saw seven meadow larks rise from a snowy field beside the railway. I have never seen one of these birds in New England in the winter and the sight surprised me in New Jersey. Do they winter so far north in any numbers? The day was very cold and the ground well covered with snow, and to me the larks seemed far from where sensible larks should be at such a time.—C. H. A. (Boston, Jan. 27).

DO SQUIRRELS HIBERNATE?

Editor Forest and Stream:

A pair of little red squirrels (*Sciurus hudsonius*) have taken advantage of a knot hole in the siding to the bay window front of my house; they enter here and live inside between the plastering and the frame; they are heard by my family every day as they rattle and gnaw nuts throughout the winter months. Whenever bright sunshiny periods occur, no matter how cold or how much snow, these little animals run out into the tops of several tall pines which stand overshadowing the roof of my house, frolic there and return at short intervals. Though they make a very loud and really disagreeable noise at times during the winter days, yet my children have become so attached to them that I have not been permitted to disturb them. I wish they did hibernate, but I know too well, now, that they don't and they won't.

HENRY W. ELLIOTT.

EAST ROCKPORT, Cuyahoga County, O., Jan. 28.

Editor Forest and Stream:

G. E. Walsh says, in your issue of Jan. 13, that squirrels are hibernating animals, that "They coil themselves up in their nest and remain dormant for a long while, varying from several weeks to a month." The squirrels in this part of the country don't do that way. They don't lay up any food for winter either. I have been in the woods after fresh snows, when the thermometer stood 10 to 18° below zero, and have seen squirrel tracks in the snow and numbers of holes where they had dug out the snow to get at a nut or an acorn. I have cut trees in the winter that were the homes of squirrels, and have never found any stores of food in any of them. I have observed the habits of squirrels closely, and have yet to see evidence that will cause me to believe that they store food or hibernate. Our squirrels here are the fox, gray and an occasional black one. They bring forth their young in March and April (the first litter) and sometimes another in the summer. Coons hibernate here but do not store any food. J. F. LAYSON.

SALEM, Nebraska.

HABITS OF THE BEAVER.—"R. M. C.," in FOREST AND STREAM of Jan 27, mentions that in an article on Nova Scotia, by Lieut.-Gen. A. W. Drayson, R. A., it is stated that "Two pine trees, growing side by side, will be cut down by the beaver's sharp teeth," etc., that one of these will sink while the other floats. Gen. Drayson has evidently been imposed on by his Indians, to whose stories officers of the English army usually give too much credit. The beaver when he stores up his wood for his winter's supply of the bark, on which he feeds, sinks it by piling it up at his front door; and I have heard some credulous hunters say that these animals had some mysterious way of keeping it below the water. As respects the deception practiced occasionally by the Indians of New Brunswick on English officials, an amusing instance came under my own notice. The Hon. Arthur Hamilton Gordon, when governor of New Brunswick, made a trip in the forests, of which he published a description in a pamphlet entitled "Wilderness Journeys in New Brunswick," or something like this. In this pamphlet he mentioned that his Indian Gabe was unable to find Nashuaak Lake. This I knew was all nonsense, for I was sure that master Gabe was quite as well aware of the position in the forests of Nashuaak Lake as I was. One morning not long after I said to Gabe, "Governor says in his book that you could not find Nashuaak Lake." To this Gabe replied, "Ugh! did not want to find lake." The fact was that they were at the forks of the Nashuaak, one branch of which presented tangled thickets and bad traveling, on this the lake was situated; the other branch was followed up by a lumberman's portage, which extended across to the Miramichi River, whither the party was bound, and this was of course the route which Gabe led the Governor, of whom he was not very fond. His opinion of that worthy expressed to me was that "he was a sugar candy man."—EDWARD JACK (Fredericton, New Brunswick).

ANTIDOTE FOR SNAKE POISON.—Habana, Cuba, Jan. 20.—*Editor Forest and Stream:* The usual treatment of serpent poisoning by the medical profession has been to fortify the nerve centers against encroaching paralysis, by alcoholic stimulation continued during the length of time required by nature to eliminate the poison from the blood by its excretory organs. Specific antidotes to neutralize the poison in the blood and thus arrest its action, have as yet been either undiscovered or little known. In the year 1882, Dr. J. B. de Lacerda, Subdirector of the Laboratory of Experimental Physiology of Rio de Janeiro, published forty cases of venomous snake bites treated with entire success by hypodermic injections of one per cent. solution of the permanganate of potassa. These cases, it is claimed, have proved this drug to be a specific neutralizer of the noxious virus of the *Crotalus.* Five or six injections were introduced in and about the wound made by the fangs of the serpent. I am informed that this treatment is rapidly becoming vulgarized in Brazil and is meeting with uniform success. A little case containing a hypodermic syringe and a one drachm bottle of one per cent. solution of permanganate of potassa could easily be carried in the vest pocket of a person liable to accidents with venomous reptiles, and might prove a precious addition to their equipment.—NEMO. [The results of Dr. Lacerda's treatment have been given in these columns before. Our correspondent's suggestion of providing the antidote and means of use is worthy of adoption.]

ANIMAL LIFE NEAR TOWN.—Toronto, Canada.—The papers report that Mr. David Kennedy, the reputed oldest sportsman around Toronto, recently shot a magnificent red deer close by his residence at Lake View Park, three miles from town. The animal was being pursued by two hounds, who must have been in the chase for a large number of miles, as the dogs were almost worn out when the animal fell. The deer was heading straight for the lake. He tipped the scales at 150lbs. This visitor is quite as big a curiosity as the beaver which found its way to the northwestern part of the city a couple of years ago. Another example of animal recklessness in this section may be noted in the fact that last week a large horned owl flew into the city, and as the acme of audacity perched on a telephone pole in front of W. M. Cooper's gun store. The owl was more fortunate than the deer, for he got away without molestation.—W. R. W.

GROUSE AND THE SNOW CRUST.—Maine.—I often read or hear in roundabout ways of the ruffed grouse being imprisoned by heavy crusts and thus perishing, but having always lived in a grouse country and being much in the woods without ever having met any evidence to make me believe that such is the case I am inclined to class the notion with the "hoop snake," and like fallacies. If any one does personally know of an instance in which a ruffed grouse has come to its death in such manner, they will interest at least one reader by making the facts known. The mere circumstance that grouse often bury themselves in a light snow I do not think should be taken as evidence that this proves disastrous to them, for it seems to me that he is too wary a bird to allow himself to get sealed in, and "Kennebec's" article in your issue of Jan. 20, points to the same conclusion. For eleven consecutive winters a flock of ruffed grouse "budded" regularly on a birch tree in our door yard, and nothwithstanding the many bad crusts during that time, I never knew their numbers to decrease in consequence. Some seasons fewer representatives would survive the shooting season than those of the preceding year, but their numbers never diminished during a winter. The eleventh winter only one bird made its appearance soon after close time, and this one met its fate from the gun of a poacher, who was fined accordingly.—BLACK SPOT.

MIDWINTER APPEARANCE OF THE RED LINNET (*Carpodacus purpureus,* Gm.).—Halifax, N. S., Jan. 27.—During the past three weeks the peninsula of Halifax has been visited by numerous flocks of these birds, many of which have been captured alive by all sorts of contrivances. Our weather has been unusually changeable, hardly the same for twenty-four hours at a time; one day quite warm and spring-like, the next day a jump to zero, then hail, sleet and rain and a rattling storm from S.E. The usual time for the linnet to visit us is about April, and I believe this is the first instance known in the memory of our "bird men" of its appearance in midwinter. They must find it difficult to obtain their accustomed food, but apparently manage to eke out a subsistence on the seeds of the withered plants which raise their heads above the snow, notably the common burdock (*Lappa officinalis*). Some, however, have been found dead, showing that they succumbed either to cold or hunger. It would be interesting to know whether the visit of this bird at this season has been confined to Nova Scotia or not.—J. MATTHEW JONES.

A DUCK'S HOMING.—Charles Bradford, of Manchester Center, who deals quite extensively in fowls, recently sent a box containing five ducks to a gentleman in Wadley Falls, Strafford county, N. H. Among the number was a black duck whose wings had not been clipped. Last Monday Mr. Bradford received a note from Wadley Falls informing him that the box had arrived all right. About 2 o'clock on Thursday afternoon Bradford heard a great commotion among his fowls, and on going into the yard discovered in the center of a group of much-excited ducks, geese and hens the identical black duck that had been sent to New Hampshire only a few days before. He had flown back nearly 200 miles, evidently believing that there is no place like home.—*Rutland (Vt.) Herald.*

CALIFORNIA ACADEMY OF SCIENCE.—At a meeting held Jan. 3, 1887, the Academy of Science elected the following officers for the ensuing year: President, H. W. Harkness; 1st Vice-President, H. H. Behr; 2d Vice-President, G. Hewston; Corresponding Secretary, H. Ferrer; Recording Secretary, Chas. G. Yale; Treasurer, John Dolbeer; Librarian, Carlos Troyer; Director of Museum, J. G. Cooper. Trustees—Chas. F. Crocker, D. E. Hayes, S. W. Holladay, Thos. P. Madden, J. M. McDonald, E. J. Molera, E. L. G. Steele.

SNOWY OWL.—North East, Erie Co., Pa.—A party on a recent gunning expedition shot a large white or snowy owl near this place that measured 5ft. 6in. from tip to tip of wings. Only one wing was injured and it was captured alive, and is now on exhibition in a prominent show window. It is the first I have heard of captured in this section for some years.—A. A. A.

AN ALBINO QUAIL.—High Point, N. C., Jan. 30.—A party of gentlemen from the Bellevue Hotel, while out quail shooting last week, flushed a snow white quail, but failed to bag it. The bird is still here, and whether any one will be fortunate enough to secure it remains to be seen.—POINT.

Camp-Fire Flickerings.

"That reminds me."

204.

NO man was ever known to prevaricate as to the number or size of the fish that he captures, to stretch the blanket as to what he has done with his gun, or to lie about the performances of his own dog! Once, only once, did a doubt pass through my mind. A friend told me that he captured, with a light bass rod, a catfish that weighed 400lbs. besides the head. I raised my eye and looked at him, but his solemn visage and his reputation for truth and veracity, which at least was equal to my own, instantly dispelled every shadow of doubt.

But I started out to write about my dog Pete, not because Pete is ambitious to see his name in print, but for the benefit of science. I notice in FOREST AND STREAM that Sir John Lubbock proposes a new departure in the way of measuring the intelligence of the dog. His printed cards and colored sheets are all well enough in their way, but it struck me that if a few dog owners who read the FOREST AND STREAM—men of unquestionable veracity—would come to the front with solemn facts that have come under their own observation, that they have seen with their own eyes, in working their dogs, dogs of high intelligence, both by blood and education, it would do more toward settling the scientific questions which Sir John is striking at than any amount of experiments with common curs.

With this end in view, hoping that others may emulate my example, I propose to put upon record a couple of solemn facts relative to Pete. He is now an aged dog. Our acquaintance began in puppyhood, that is, in Pete's infancy, not my own. His highest ambition now is a cozy place on a blanket by the kitchen fire, with a plate of soft victuals now and then to satisfy the inner dog; I guess that expression is allowable, at least, I can't see why it is not just as appropriate as "inner man;" but now to the facts.

About five years ago I was out with Pete after quail—he on one side of the creek and I on the other. The weeds were high and I lost sight of him. I called him, whistled for him, sat down on a log and waited for him, but Pete did not come. I went down the creek over four miles to a log, crossed over and then back on the other side up to where I had lost sight of him. After wandering for over two hours I at last got sight of him. He was fast in the crack of a rail fence, his head and foreleg through upon one side, and his feet nearly touching the ground upon the other, upon his right side and his tongue hanging out. I rushed at once to his relief, but just before I got to him, to my utter astonishment, I flushed a flock of quail! My dog looked at me completely disgusted, but crawled through the fence and came up to me wagging his tail. Of course I understood it all. Just as he turned sideways to slip through the crack he scented the birds, and true to his blood and training, he instantly came to a point. This was years ago, when in full possession of all his faculties. But now for fact number two, indicating not only great intelligence on the part of the dog, but showing that he fully appreciates a joke.

My better half, inclined to be a little plump, is not so tall as myself by a full head. I called her one day playfully, in presence of Pete, "My little quail." Instantly he came to a point, as naturally as if she had been a real quail, except that he had one eye shut, and the end of his tail, instead of that rigidity that the hunter never fails to notice when his dog makes a true stand, was gently swinging from side to side. The fun of it is that now that woman never goes into the yard, in my presence, but old Pete instantly comes to "a point." Here we have memory, intelligence and a sense of the ludicrous combined. Can any other truthful reader of your paper come forward with any dog facts for comparison?

SOL. M. FACT.

A WHITE HARE SHOOT IN SCOTLAND.

THE snow is a foot deep in the strath, and a short way up the hoary-headed bens it lies now and then in drifts wherein a man might sink far out of sight were it not that a sharp frost has covered all the snow with a thick scintillating crust. It is the very best time for steaming hot hare-soup, rich and fragrant with spices, to make one think of approaching Christmastide, and tenant's balls, cheery with the giddy whirling of Highland lasses and braw gillies, threading the mazes of the Reel O'Tulloch, and skipping to and fro in honor of Sir Roger de Coverley, may his shadow never be less!

I was very busily engaged in wrapping wire netting around the trunks of our young fruit trees, for soon the rabbits would no longer be able to scratch and dig through the snow, and then the pear and apple trees, yea, and the gooseberry bushes, so overladen but a few months before with the wherewithal for the tarts and rolly-pollies, would be stripped of their tender bark by the long incisors of the white-tails, unless protected.

The head keeper of the adjacent shooting chanced to pass by:

"Have ye any catridges loaded, lad?" he asked.

"Aye, that I have, Angus," I replied joyfully.

"Aweel, then I'll coom for ye in the morning, or mebbe ye'd better be up to the lodge, and we'll tak' three or four o' the lads an get some white hares the morrow."

He went away whistling "Jennie's bawbee," and when I ended my task I returned to the house, elated at the prospect of the morrow's sport, and not a little proud at finding that a little icicle was hanging to my moustache, a proof positive that I possessed such an article, a fact most strenuously denied by the majority of my youthful acquaintances.

The next morning I sallied forth to the keeper's lodge, my gun well greased, my boots well oiled and my cartridge bag replete. I had made but a few steps when I had to turn down the flaps of my thick cloth cap over my ears, for they tingled with the cold, and I ran along the hard road to warm myself.

"Will ye hae a drap o' this, lad?" inquired Angus, handing me not a puny pocket pistol, but an obese quart bottle that he fished out of his game bag.

"No, thank you, Angus," I said, "I never take it."

"Sae young and yet sae wicked," he remarked.

"What do you mean by that, Angus?" I asked.

"Weel, ye see," he answered, with a merry twinkle in his keen gray eye, "in all the temperance lectures I ever heerd, there was a half a baker's dozen, that is about six men and a boy, as was awful examples that had been redeemed from perdition by whoskey, so I got to thinkin' all the temperance folk must hae used to get foo afore they took to the other way."

The two under keepers and the four drivers laughed very heartily, out of respect for the head keeper and his bottle. I did the same out of general policy, and we started for the hills.

At first we made our way over lowland fields, and saw the partridges all huddled up under the lee of tall stone fences, and the pheasants grouped around stacked sheaves of wheat, placed here and there for their benefit. A few sheldrakes went flying over our heads, taking a short cut over the big bend in the river. Then we began rising and rising until we were on the moor, and could see the heather peeping at rare intervals from beneath the crumbling frosted snow.

Now and then a cock grouse arose before us with his alarmed cry, not knowing that all danger was over until the next 12th of August, and winged away his flight out of harm's reach. A couple of black cock sat far away on a stone fence, big black dots upon the snowy sheet.

The four drivers left us, and we kept on rising upon the spur of a big ben, until we reached the top, then we scattered along the summit and sat behind big boulders

awaiting results, with our cartridge bags beside us, for there might be some lively loading.

In the meanwhile the drivers were beating the peat-bogs at the foot of the mountains, shouting lustily and scaring away the hares from their hot forms. Soon I heard the guns popping near me, and presently I saw a big white hare climbing up toward me, looking on the snow like some weird, shadowy thing. Bang, and he rolled over; another comes, and he lies kicking beside the other. While I am loading a big fellow passes by me, but I manage to turn just in the nick of time and bowl him over. They keep on coming for a few minutes until the drivers reach the top of the hill and begin to pick up the dead and wounded. They are all stretched side by side upon the snow, forty odd, while we all take a rest. Then we take a long turn through the peat bogs and topple over a good many more as they arise before us. Then we turned toward home, wishing that some of our game might miraculously and on the spot be turned into reeking bowls of the savory soup, for we are very hungry and cold, and there is but a scanty remnant left in the big-bellied bottle.

The way home seemed short enough, however, for albeit Douglas Jerrold hath said that it requires a surgical operation to get a joke into a Scotchman's head, I have not found it so, and think that since his time either the Scots have changed or else Douglas knew not whereof he spoke, and right merrily we jested on our way home, and spoke of just such another hunt for the next week.

G. V. S.

ON THE TRAIL OF AN ELK.

SINCE taking up my residence in the Centennial State, I have made a practice of taking at least one month of each year to gratify a natural liking for hunting, fishing and a general good time among the beautiful scenery with which nature has provided the peaks, passes, gorges, plains and parks of the Rocky Mountains. Here we find country fitted to the needs and habits of a great variety of game. The rolling prairie is the natural home of the antelope. Rough and almost inaccessible mountain sides and peaks furnish comparative safety for the sure-footed mountain sheep, while the thickly wooded and more level portions abound in deer, elk, etc. Bear, mountain lion, wildcat, lynx, beaver and many other species of game are met with in their natural haunts, while the innumerable streams afford trout fishing seldom equaled. He would be a very exacting sportsman indeed who could not find sufficient use for both rod and gun while passing through the hunting and fishing grounds of western Colorado. So much for an introduction, and now that I come to the story part, one hardly knows which hunting yarn to tell first.

The incident of which I write occurred during the return journey of a month's hunting trip up in the Rabbit Ear Mountains and North Park region. My two companions and myself were on an old Indian trail crossing the mountain toward home, with our saddle and pack horses, traveling when we felt like it, fishing and hunting as inclination or our larder required, and having a time that no sportsman who could endure our mode of travel or manner of living could help enjoying.

We had left the Rabbit Ears early in the morning, and after crossing the Grand River struck into the Arapahoe Mountains heading toward the snowy range or Continental Divide.

Six miles from the ridge of perpetual snow we came suddenly upon one of the beautiful parks so often met with in these mountains; it contained about 400 acres, nearly as level as the prairie, and was inclosed on all sides by dense woods and rough mountains. Through the park ran a little stream that was literally swarming with trout, and whom should we here encounter but a party of Boulders' citizens with well-filled trout baskets, having a most exciting time pulling the fish from the clear waters of the stream. We were invited to take dinner with our friends at their tent, and in the course of an hour or so were enjoying ourselves as hungry hunters generally can when traveling through the mountains, and in this clear, pure, appetizing air. Elk, antelope and deer were furnished from our supplies, while trout in abundance were furnished by our friends. Flapjacks were our bread and coffee our drink. No wagon could get where we were and of course dishes were not in great abundance, but hunters in the mountains soon accustom themselves to knife, fork, spoon, tin cup and plate; cotton sacks serve as pepper box, sugar bowl, for sacks will not break and still more important, will pack. Some of the party concluded to rest at camp, some to fish, while five others with myself concluded to hunt in the adjacent hills for deer and elk. Shouldering our rifles we struck out for an afternoon's ramble for what we could find. I had never hunted with any of the party, but before going very far it became apparent to me that if I got any game I must go it alone. So leaving the noisy crew I took my course along the side of the mountain until I came to some soft ground, where a little spring of clear water came bubbling from the side of the hill, forming by its moisture a green spot below for several rods. Upon looking carefully I saw elk tracks with muddy water in them. I watched the water for a moment, and as it cleared so rapidly I became convinced that my approach had frightened the elk away, and that it had been drinking the water from the spring or eating the grass from below it. In either case I concluded that he was not so very far away, and thought I would follow his trail as far as I could and try and get a shot if possible. To my joy I found upon tracing him down to the cañon below that he had gone toward camp and against the wind, two circumstances greatly in my favor.

After tracing him as far as the ground would permit I concluded that he would not leave the gulch until reaching an easier place to get out than the steep sides which run along for some distance in advance of me. Thus reasoning I cautiously followed the gulch, which was from 10 to 40yds. in width. Keeping a sharp lookout on all sides, peering around each bend and angle before exposing myself to view. I went in this manner for some distance, but no game gladdened my sight. The only thing that kept my spirits up was that the sides of the gulch had been so steep since I lost the trail on the hard ground that I was reasonably certain that I was on the right track. Keeping on a little way further I came to a little draw taking out of the main gulch, and upon examination I found fresh tracks leading up toward the ridge and in the direction where I thought the boys were. This began to look bad for me for it placed me to windward and traveling directly from camp, but determined to try a little longer, I made my way up on top of the ridge, and looking carefully around caught sight of a splendid pair of antlers about 150yds. away and moving slowly along, but the trees hid him too much to allow anything like a sure shot; and not wishing to be long directly to "wind" from him, I concluded to go down into the gulch again, retrace my steps a short distance, come up in advance of the elk and wait for him to come along. Just as I thought I was far enough down and was making my way carefully up the steep sides of the ravine, I was getting right down to some of the finest Indian stealthiness ever practiced when bang! bang! bang! bang! went four rifles, and rattle-te-bang they went again as fast as two Winchesters, a Maynard and Sharps could be fired, right ahead in the immediate vicinity of my elk. I thought surely I had driven the game right on to the boys and they were having the greater part of the sport while all my hard work and nicely laid plans were knocked in the head, and determined to be in at the death anyhow, so I went quickly up the hill about 200yds, where I found the rest of my party peppering away at a grouse up in the top of the tall spruce trees. The bird was finally shot. Dr. E. told me that at the time they began firing at the bird he imagined he saw something stirring a little way up the ridge, but thinking he was mistaken, he had turned his attention to bombarding the grouse with the rest of the boys. I told him my impression was that he did see something stirring up the ridge, and had he waited a few moments before firing at the bird he might have had something worth shooting at, an elk, for instance. He then asked if I knew anything about an elk being there, to which I replied that I had a faint inkling of the whereabouts of some such an animal, as I had been chasing him for the last three hours and had finally located him at about the place he mentioned. I then went there and found evidence that I was correct in thinking the doctor had seen my elk, or rather that the elk had been there and had turned squarely around in his trail and taken the back track. About discouraged, yet concluding, as the trail led nearly in the direction of camp, to follow it on a little, I again made a start and had reached a point about a quarter of a mile directly south of camp when I lost all trace of the game. The country was quite level, and so hard that no tracks could be found. Tired by this time I concluded to take a rest, then march into camp with the same shell in my rifle that I left with. Seating myself comfortably upon a fallen tree, I was thinking matters over, when to my astonishment I saw my elk, or at least an elk, walking slowly along 70yds. from me and almost directly in front of me. It was probably the one that I had been after all the afternoon and had in some way passed, but now I knew he was mine. Bringing my Maynard to bear on the right spot of the noble animal as he passes nearly broadside to me, I touch the trigger and have my reward for the four hours of tramping and trailing. And now, as I think of that half day's trail, I am certain it gives me more pleasure than it would had I shot him at the spring where I first discovered him, for then I would not have had the keen anticipation of coming excitement and sport which sometimes give more pleasure than the results themselves.

MAYNARD.

IN THE UPPER PENINSULA.

O'TRAIN, Mich.—*Editor Forest and Stream:* Thinking an item from this great game and fish resort, the Upper Peninsula of Michigan, would interest your readers, I offer you the following, my experience with a lucky Ohio editor, my part in the incident being that of "guide and companion:" My lucky man was Mr. J. H. Newton, editor of the Newark, Ohio, *Daily Advocate*. He came to this locality, to fish and hunt, in the latter part of August last. After engaging my assistance we made proper arrangements, providing ourselves with the necessary supplies, and started down the south shore of Lake Superior, in a small boat in a little inland lake called Beaver Lake, which is some twenty-five miles eastward of this place. On our way down we stopped at what is known as the old Bay Furnance dock, to catch trout and camp for the night. Around this old dock are occasionally to be found as large and fine specimens of speckled trout as swim in Lake Superior. The water, however, being still and deep, Mr. Newton was not very successful in catching them with flies or any of his artificial devices. Angle worms were not to be found here, and minnows were exceedingly scarce. After hard work I succeeded in capturing three small minnows, and with these Mr. N. was not more than fifteen minutes in landing three fine trout, averaging 2¼lbs. each. That evening and the next morning he took in all nine of these handsome trout, all weighing from 2 to 3lbs.—seven being taken with live minnows and two with artificial devices. We then went on to Beaver Lake, which is situated close to the shore of Lake Superior, where we went into camp. Here we found excellent opportunity for fishing and hunting. The little lake was full of small-mouthed black bass and the brook that carried its waters into Lake Superior, with its many little cataracts and cascades, was full of small trout. We found it an easy matter to take more bass and trout than we knew what to do with. Mr. N. one day took two fine small-mouthed bass (one with a fly and the other trolling with a phantom minnow) that weighed over 7lbs each. These were the finest specimens I had ever seen, even in this region. On the night of the 26th of August I took Mr. N. out on the little lake to hunt deer. He had never hunted deer before in his life, and it was plain that he was a novice. But the result showed that what he lacked in skill and experience he made up in pure luck. I had a Winchester rifle which I instructed him how to use, and after giving him such other instructions as he needed, I placed him behind the head-light at the front of the boat, and we started around a small bay or arm of the lake. We had scarcely proceeded half-way around the little bay, when the reflection of our lamp came in contact with a deer's eye. It resembled a ball of fire gliding on top of the water. In an instant another "ball of fire" was espied about ten feet behind the first one. Two deer had attempted to swim across the little bay, and were then directly in front of our boat. Our light confused them, and I rapidly pushed the boat toward them. Seeing they could not pass in front of us they turned about and started to swim from us. I pushed the boat forward as quietly as possible and gained upon them at every stroke. The deer again changed course and started to return to the shore they had come from. I followed close behind and continued to gain upon them until their heads and necks were in plain view, and Mr. N. had a splendid shot. In a whisper I told him to shoot. He raised the gun and commenced taking aim, but he seemed so slow about it that I began to get nervous. "Shoot," said I again, in a louder whisper. He continued to take aim, but to my utter disgust failed to pull the trigger. The two deer were swimming close beside each other and were fast approaching the shore, but at this instant one of them passed in front of the other, so that both were directly in line with the barrel of the Winchester, and Mr. N. was still taking aim at them as if he was determined to either make a sure thing of it or allow the deer to get away without a shot. Again I said "Shoot," and he finally blazed away. I instantly saw that he had killed them both, for they immediately dropped over in the water; but not knowing what he had done, Mr. N. threw out the old shell and again raised the rifle. "Hold on, they are both dead," said I. "The deuce they are," said he, looking forward in the utmost astonishment, whereupon he proceeded to give utterance to a series of ejaculations and exclamations, expressive of his surprise and astounding amazement, which he continued for about five minutes. In the meantime I pushed the boat forward to where the deer were bleeding and struggling in the water. One of them was a fine large doe and the other a yearling buck. The Winchester ball had crashed through the neck of the doe, breaking the spine, and through the head of the little buck. A more effectual shot could not have been made by the most skillful marksman and hunter, but my editor insisted it was only chance luck. The next day we carved an account of our exploit on the trunk of a tree close to our tent. We remained in camp some eight days and feasted on venison, trout, bass and huckleberries, which my editorial companion seemed to enjoy immensely. We could have killed more deer as we saw them every day, but Mr. N. seemed to think it would be cruel slaughter to kill more than we could use, and I cordially coincided with him in his humane views in this regard.

GUS DOUCETTE.

BEAR DOGS.

Editor Forest and Stream:

Your correspondent "Bruin," in issue of Jan. 20, says he has spent several hundred dollars for dogs, trying to get the right kind for hunting bears.

I have killed 73 bears, and the best dog I ever saw to follow and stop a bear was a little short-legged yellow cur. He would nip the bear's hind parts, and as the bear whirled to catch him, or threw himself backward for a grab, the little dog, always on the alert, would skip back just out of reach of his enemy's paws, and as soon as the game started to go, he would "chaw his bacon" again, and in this way so annoyed the bear that he soon came to bay.

A dog of great courage that will make a strong grab generally pays for his tenacity with broken limbs or his life. Still it requires courage in a dog to attack so large a beast as a bear, and the dog must possess a strong capacity for scenting, as the bear leaves a very small quantity of odor, especially after the track is twenty-four hours old.

A bear broke the chain of the trap in which he was caught last September, in the town of Phillips, Me., and the boy who went to tend the trap, took his little cur dog with him, and with the dog followed the bear two miles. When the boy came up the cur and bear sat a few feet apart eyeing each other, the dog barking just enough to let his master know he had him.

It is not common for a bear to tree when followed by dogs, preferring to stand a chance of embracing his enemy, and woe to the poor brute that gets into his clutches.

I know your correspondent's brother, the bear hunter of Roxbury, Me., and a successful one he is, too. Two years ago he killed nine bears in one oak grove. J. G. R.

BETHEL, Me.

Editor Forest and Stream:

Correspondent "Bruin" speaks with pride of his dog jumping on a bear's back after the bear had struck him with his paw. That will do to tell to marines. A hunter knows better—unless it was a cub that struck the dog. When an old bear gets in a blow on a dog, the latter "has had his day." A few years ago a bear got disturbed in his den, and all the dogs in several towns had a try at him with their owners, for fourteen days, and no dog brought the bear to a stand, but several got their backs broken. This was in Franklin county, Me. URSUS.

BIG-GUNS IN VIRGINIA.

Editor Forest and Stream:

There is the best authority for stating that parties in Alexandria, Va., have conspired to introduce into the State Legislature (which will soon convene) a bill authorizing State, district or county officers to sell licenses for use of large guns (now illegal) in shooting ducks, etc., and that they have secured the services of an able and well-known lawyer of that city to manage the affairs by lobbying and otherwise.

If such a bill should pass, and the license fee be set high, then a comparatively few pot-hunters and wealthy men may monopolize duck shooting in the State, and if the fee be moderate or low, then so many might avail themselves of the privilege as to keep the big-guns booming everywhere ducks venture to alight. In either event, the result would be nearly the same, for those fowl that escape death would seek safer and quieter regions.

The FOREST AND STREAM reaches a good number of those legislators who must vote on the proposed bill, and in that way and otherwise it may prove a defender of the interests of the great army of gunners who do not desire to kill for the sake of filling the market, and have neither inclination nor leisure to indulge themselves in licenses for wholesale destruction of water fowl of any kind. Give us your aid to frustrate the plan of the selfish few in the interest of the better many. H.

KENT SCIENTIFIC INSTITUTE.—At a meeting held recently in Grand Rapids, Mich., an election of officers of the Kent Scientific Institute of that city resulted as follows: President, E. S. Holmes: Vice-President, W. A. Greeson; Secretary, C. A. Whittemore; Treasurer, Samuel L. Fuller; Corresponding Secretary, E. S. Holmes; Director of Museum, W. A. Greeson; Curator, E. L. Moseley; Librarian, E. L. Moseley.

OPENING THE CHICKEN SEASON.

IN this famed valley of the Northern Red, where the earth lies spread out for miles on miles flatter than the flattest pancake, where waving fields of ripening wheat are interspersed with strips of meadow and grassy slew, where the hum of the reaper startles the timorous grouse, and the gayly-plumed mallard fans the morning zephyr with lusty wings, the opening of the autumn season is indeed a gala day with sportsmen. Excited gunners, eager dogs and conveyances of every description begin to swarm over the golden fields of bristling stubble long before silver-footed Thetis rises from her coral-studded ocean chamber to clinch the eastern sky, and ere the lark leaves her nest to greet the smiling morn are heard the whirr of wings and the booming of guns. The lawyer is there to file his ever ready demurrer, the scribe to keep the "cases," while the jolly medicine man comes prepared to "bind up the wounds of the afflicted," and when at early noon we gather beneath the shade to revel in sandwiches, titled monarchs could not possess lighter hearts nor better appetites.

The pale crescent of the harvest moon peeped out now and then from behind laggard clouds, and from the belfry tower the deep-toned bell clanged the hour of midnight, Aug. 14, 188—. Here and there the dim light of a dingy lantern or the rattle of carriage wheels announced the departure, countryward, of divers and sundry parties of sportsmen, each intent on circumventing the "other feller" in the selection of shooting grounds within easy drive of the slumbering city. Squire M., Jake B., Billy P. and the writer made up one of these parties. For days beforehand the proposed "grand opening" had monopolized conversation to the exclusion of everything else pretty nearly; the best locality, all things considered; the probable condition of the weather, all were discussed; the lack of greater diversity of opinion being largely due to the fact that only four took part in these preliminary exercises. But the auspicious moment arrived at last, and as we boarded the canopy-topped "Tinckin" behind a spanking pair of sorrels, a happier party of men and dogs it would have been difficult to find. A couple of hours' drive over a smooth country road, and we halt in close proximity to an inviting slew where M. and B. alight, while Billy and I restrain the impatient dogs, leaving the ubiquitous Jehu to hold the even ribbons over the scarcely less restive horses. Bangety—bang—bang! and a couple of hooded mergansers fall to a neat double from the "Square's" Baker, while Jake scores a teal with his right and a clean miss with the left barrel of his "s—sk—sky-scraping old S—S—Scott." The handsome William had alighted with two powerful setters in leash—for the expressed purpose of stretching his "bean poles," when, as the sharp reports awoke a sleeping shikepoke hard by, and the able-bodied descendants of Gordon and Llewellin began to sniff fun in the air, about six feet of humanity, strangely commingled with dog meat and maledictions, lay kicking and squirming amid the damp grass. To the interested onlookers the scene was ludicrous in the extreme, but no smile wreathed the countenance of the genial William, as he slowly picked himself up and eliminated the grass and dog hairs from his comely person.

Another half hour's drive and the "Square's" "pinter" comes to a beautiful stand near the edge of a freshly gardened wheatfield. The remaining two dogs, which, since the episode at the slew, had been kept in close confinement by way of punishment, were now released and backed the rigid pointer in fine style. The dexterity with which P. got his "Ithaca" in shooting trim was sufficient evidence that his ardor had not been dampened by his recent fall, even if the grass was wet, and I had scarce filled my pocket with shells and gotten well into line when a "chicken" rose with a bur-r-r, only to tumble headlong to his well-directed aim. Four more birds from this bevy of eight, all told, in due time found their way to our game pockets, while three, having run the gauntlet, escaped. After beating the cover carefully without an additional rise, we proceeded to find another covey. For some reason, somewhat to our disappointment, chickens did not prove so plentiful as we had hoped, which suggested that sundry pot-hunting scapegraces, devoid of the law-abiding honor of sportsmen, had, probably, carefully "reconnoitered" this locality before our visit. This hypothesis was very much strengthened by the fact that when, after the most diligent hunting on the part of the faithful and well-bred dogs, a stand was made and four guns were thrown into position in anticipation of a big covey, a lonesome cock or an old hen would flush wild and make off with much querulous sputtering, followed closely by half a pound of No. 8 shot as eight barrels cheered on his or her fast gathering speed.

Ten o'clock found us drawing near to a chain of pond-like slews, having only three ducks and thirteen chickens in the ice-box, and a dazzling sun was beating down upon us most unmercifully. As we drew near the first pond the suffering dogs, disregarding all commands, dashed through the heavy margin of grass and reeds, and were soon paddling contentedly in the cooling waters beyond, causing a couple of teal to take wing. One of them the "Square" carefully stowed away in the capacious game pocket of his shooting coat a few moments later, while the other gracefully tumbled to my right barrel. Sending the team to a neighboring farmhouse, where branching shade trees and a cool-looking veranda extended a mute invitation for a delightsome nooning, we proceeded to take in the slews by way of adding a trifle of keenness to an already tolerably robust appetite. Patiently and zealously we threaded the tangled slew grass without a shot, until, wearied with the exercise, we threw our tired limbs upon the soft meadow grass to rest and hold a council of war. With what a charming sense of solid comfort did we drink in the sweet perfume of the flowering meadow. But oh! how Old Sol did pour down his sizzling rays upon our already blistering necks. "Mark south!" Sure enough, there go seven bouncing mallards into a slew about half a mile from our resting place. Instantly every man is on his feet, the scorching rays of the sun forgotten, and with stealthy steps we draw near to reconnoiter. Cautiously each in turn takes a peek. There sit the mallards proudly floating upon the glassy pond. As the slew is some 300yds. in length, the "Square" and B. conclude to go round to the head of the pond, leaving the now exultant William and myself to "take 'em" as they come out, provided there are any left to come out after being interviewed by our veteran comrades-in-arms. Impatiently we wait, hugging the tall grass and semi-occasionally taking a peep at the unsuspecting ducks paddling well up the pound. Presently the helmet caps of the "Square" and his companion can be seen approaching from the opposite direction. The mallards begin to straighten up their long necks suspiciously, and a moment later bound into the air with one magnificent sweep of powerful wings. Three of them stop to the sharp reports of the two guns, while the remaining four, badly "rattled" and flying widely apart, come sweeping down the narrow pond directly for our stand. Now, if ever, was the opportunity for Billy and me to show the "Square" and Jake "just how it ought to be done." On came the ducks, and with finger on trigger we held our breath and waited. "Now's our time!" says P., and with the simultaneous reports of our arms, a pair of old drakes pitch into the grass; and as the remaining brace climb higher toward the zenith a couple of ounces of shot send the feathers flying skyward, while two inanimate mallards bowl headlong into a neighboring cornpatch. "Good boys!" comes from the further end of the slew, and we feel that the compliment is merited.

Twenty minutes later we were seated upon the shady porch of the farmhouse, and the manner in which a beautiful cold luncheon and a generous pitcher of rich, creamy milk disappeared would have created a panic in the average boarding-house. The party then repaired to a newly built granary, where tired limbs were stretched upon clean, sweetly-smelling pine boards, and men and dogs enjoyed an hour's refreshing sleep.

The arrival of another hunting "outfit" awoke us in time to be the eye witnesses of an impromptu scrape between the dogs belonging to our party and those of the newcomers. This trifling unpleasantness was, however, nipped in the bud, and as the western heavens unmistakably betokened a heavy thunder shower, we judged it best to hitch up and jog homeward, stopping to levy tribute upon any chance covey of birds the dogs might locate. The first few miles of the way proved uneventful, P. devoting his time to making valuable suggestions to the driver, while the balance of us found temporary relief from anxiety—as the muttering thunder grew momentarily louder and the heavens darker—in bursts of laughter at the interesting fragmentary dialogues which ever and anon took place between that worthy and Sweet William. As the harsh roar of the gathering storm increased in volume, the deep-chested, mettlesome steeds settled to their work and the long swinging trot had already left the "longer half" of the turnpike behind, when the necessity of forthwith seeking shelter forced itself upon our attention as great, splashing drops of rain rattled upon the buggy top and pitted the dusty roadway like so many bullets. "Just as I told you," apostrophizes the querulous William, "here we are a mile and a half from nowhere and a 'regular old he' cyclone upon us. We ought to have stopped when I wanted to, back there at the house by the creek." A hasty glance at the gloomy situation more than half verified P.'s ominous forebodings. Great masses of inky black clouds were rolling and tumbling and vomiting forth forked lightning, while the general roar of the fast approaching tornado was now and then drowned in crashes of thunder so terrible that it seemed as if the nervous horses would spring through their harness. Bad as the situation certainly was, the only thing left for us was to continue our already uncomfortable journey until we could make a farmhouse a little more than a mile further on, where, from the appearance of the outbuildings, we felt sure, shelter for our horses could be obtained. On we sped, quartering the now bursting tempest, the "Square" drawing the ribbons, while chunks of mud very plentifully bespattered everybody and torrents of rain and frequent down-pourings of savagely biting hail increased the discomfort of man and beast. Ear-splitting thunder claps, dazzling lightning, flying sheaves of grain, yelping dogs, swaying buggy and well-nigh frantic horses completed a picture, sublimely entrancing and long to be remembered; but thanks to the strong and skillful arm of "Square" M., the dilapidated "Timkin," with something of the mud-scow-in-action appearance, finally rolled up under the sheltering roof of a spacious shed. The dripping horses were quickly rubbed down and blanketed and each of us gazed into the mud-begrimed countenances of the others with a feeling of temporary relief, while the drenched and shivering dogs with drooping ears and tails hugged dispiritedly between trembling limbs sought the grateful comfort of a straw pile.

For a full hour we are glad to look forth upon the terrible tempest of whose fury we had lately been the sport, and when, at last, "the clouds roll by, Jennie," another start is made, notwithstanding that the rain still descends, though in somewhat less blinding sheets. A mile on our way a chicken is spied upon the sheltered side of a shock of wheat, while three elongated necks stretch up from the dripping stubble to view the strange caravan. This sight is too much for the "Square," who draws rein with the remark, "We came after chickens, you know," and forthwith prepares to "limber-up" his Baker. P. and I follow suit, and in exactly two minutes by the watch four more chickens are tossed into the buggy and the cavalcade moves on to close the chapter of our first outing, without mishap or further incident.

A. B. GUPTILL.

FARGO, Dak.

NEBRASKA NOTES.—Salem, Neb., Jan. 25.—We have had a very open winter, with but one snow to amount to anything. The few quail that were left after last winter's blizzards did well last summer; if we have no such weather this winter we will have some to shoot next season. Prairie chickens are doing well and seem to be as plentiful as last season. The "city chap from town" is exterminating our prairie chickens. He pays no attention to the law, but goes out with dog and gun in July and August and wipes out whole broods before they are strong enough to get out of the way. Robins, blackbirds and meadow larks are here yet, and act as though they intend to stay with us through the rest of the winter. Last night I heard a flock of geese going north.—J. F. L.

THE MAINE DEER LAW.—*Editor Forest and Stream:* No action has yet been taken on the petition before the Maine Legislature to permit the hounding of deer in that State, though it is pretty certain that it never can get beyond the committee. But the true inwardness of the movement is none the less apparent. The way the FOREST AND STREAM handled the matter last week editorially was simply grand, and such a strong argument is bound to be felt, even in the State House at Augusta.—SPECIAL.

SUCCESS WITH WILD CELERY.

SYRACUSE, N. Y., Jan. 28.—*Editor Forest and Stream:* Some three years since I wrote you making inquiry about wild celery, where to obtain the seed or bulbs preparatory to sowing or setting the same. In response I received a short note announcing that you were not sufficiently posted in regard to the matter to give me directions, or to post me upon the same. You, however, did send me a copy of your paper published Jan. 5, 1882, in which was an article on the subject, written by Mr. D. W. Cross, of Cleveland, Ohio. It was stated to me in your letter that this was the best article you had seen written upon the subject, and advised me to write to Mr. Cross, when I would most likely find out all he knew upon the subject, and get such instructions as he might be able to give in the matter.

I had for a number of years shot in the fall, at the pond north of this city known as Wood's Pond, or Big Sandy Creek Pond, on the bank of Ontario Lake, Jefferson county, and near Big Sandy Creek. I have always felt considerable interest in this pond. There is and has been for years there a heavy growth of wild rice, which proves attractive to ducks in the fall, especially of the more common class. There was no wild celery at this place. The result was that ducks calling for this kind of feed frequented this pond only in limited numbers, say redheads, canvasbacks, etc. I was, of course, much interested in regard to the growing of celery at this place. I wanted, if possible, to make this pond attractive for all kinds of ducks. I conversed with many who knew the ground well (perhaps better than I did). I was discouraged. It was said the ground was not adapted to its growth. Suffice it to say I wrote to Mr. Cross (who, by the way, proved to be very much of a gentleman as well as a sportsman). He knew, if not all, much about wild celery. He gave me many new ideas regarding its reproduction, and proffered to me much advice. I made an order through a friend of mine, for seeds and bulbs, and through his advice and by his directions sowed the seed and planted the bulbs at various points on the pond known as Big Sandy Pond.

In your letter to me you desired me to write and inform you of my success in the undertaking. Last fall, late in October, I went there again. I found the wild celery seed sown had taken fully and well. The bulbs also had proved effective and had come up in great abundance. But few parties residing there knew what it was. Examination showed, that in the short time since it was sown and planted it had come up in great profusion and that even now the plant has become quite abundant. It has taken root where I really had but slight hopes of its coming and is now proving to be quite abundant. Instead of the ground being unadapted for it, the reverse is true, and it grows splendidly. I find it grows well on the marsh ground when the water is less than a foot deep. I find it grows well on hard ground, shallow water, or on same ground, water 5 to 8ft. deep. In fact I find no difficulty in producing it anywhere about this marsh. I call it a grand success. There is no doubt but what the inhabitants will be perfectly satisfied in three years from now that they have all the wild celery on their grounds they want. At the present time it has become quite abundant and there is no doubt about its success. Poperly sown or planted, I have no doubt that it can be raised on most any marsh about the country. The seed is easy to get, and it is not hard to get the bulbs. A little care exercised in sowing and planting is about all required.

S. E. KINGSLEY.

THE MICHIGAN CONVENTION.

THE twelfth annual meeting of the Michigan Sportsmen's Association assembled at the Pioneer Rooms in the capitol at Lansing, Tuesday evening, Jan. 18. Delegates were present from the Bay County Sportsmen's Club, of Bay City; Kent County Sportsmen's Club and the Pottawatomie Club, of Grand Rapids; Kalamazoo Game and Fish Protective Association, of Kalamazoo; Battle Creek and St. Joseph County Field and Sporting Club, of White Pigeon. A number of individual members were also present, and a number of the members of the Legislature were present during the various discussions and some of them took part.

After the usual routine business of opening, the Association invited members of the Legislature and all others interested in the subject under discussion to attend and participate and then adjourned until the following morning.

On reassembling in the morning, Mr. H. H. Briggs, of the California State Sportsmen's Association, who was present as a visitor, kindly favored us with a description of the work done and the results accomplished by the California Association.

Resolutions of respect to the memory of Messrs. A. H. Mershon and A. J. Holt, deceased, members of the Association, were read, adopted and ordered spread upon the records.

The Association then listened to the address of the President, which was a resumé of the work of the Association for the past twelve years with a statement of its results as they appear on the Michigan statute book, and an earnest appeal for the appointment of game wardens.

The Committee on Law made a report recommending that the Association use its best efforts to induce the Legislature to pass laws.

1. Providing for game wardens.
2. Prohibiting spring shooting.
3. Making possession of game out of season *prima facie* evidence of illegal killing.
4. Amending the criminal trespass law so as to require owners of lands to post the same before they could prosecute a trespasser criminally.

Considerable discussion arose in regard to the details of the report, the manner of appointing wardens, their power, duties and compensation, spring shooting, etc. At the close of the discussion it was unanimously resolved that the Association earnestly request the Legislature to enact laws upon the subjects recommended by the committee, and particularly that it enact the game warden bill, introduced by A. L. Lakey, a member of the Association. After recess for dinner the Association listened to the reports of the committee on enforcement and publication, which were short. The publication of the next volume of the Association's proceedings was left in the hands of the directors with power to act.

The annual reports of the officers were then read and approved. The next annual meeting was ordered held at

Detroit, Jan. 19, 1888. The following officers were then elected: President, E. S. Holmes, Grand Rapids, Mich.; Secretary, M. Norris, Grand Rapids, Mich.; Treasurer, N. A. Osgood, Battle Creek. Director, four years, A.L. Lakey, Kalamazoo.

The following delegates were elected to represent the Association at the next annual meeting of the National Association for the Protection of Game Birds and Fish: E. S. Holmes, M. Norris, E. C. Lancaster, H. Widdicomb and E. C. Nichols, after which the meeting adjourned *sine die.* M. NORRIS, Secretary.

HOME-MADE EXPLOSIVE BULLETS.

Editor Forest and Stream:

An acquaintance of mine says, "You are liable to pick up a useful point from any darn fool," and you are partially indebted to the saying for this communication. I noted "Mark West's" inquiry concerning explosive bullets. Five years ago he answered in FOREST AND STREAM a letter of mine, and I freely acknowledge that I was benefited. Now, perhaps, I can give him a point in return. I have used explosive bullets for years, but only in one pattern of rifle—the military Snyder-Enfield .577 bore. The bullet in the service ammunition is very soft. In attempting to drill a hole in the point to make a "spatter ball," I discovered that in the interior was a cylindrical cavity about .18in. in diameter, and ⅛in. long. I cut the point of the ball square off so as to expose the hollow and reamed out the front slightly with an old woodscrew countersink. I then filled the hole in the front of the bullet with fine powder. Taking an iron, headless shoe nail, such as the old people here call a "sparrowbill," I pressed the point down through the powder till it stood firmly on the lead at the bottom, and the length of the nail being slightly less than that of the hole in the bullet, this left the head end flush with the bottom of the countersink. Then I took a Berdan shotshell primer (called "sauce-pan primers" by boys here), and with a punch seated it carefully but firmly on the nail head. This closed the cavity. The nail acted as an "anvil" to aid in igniting the primer. The very slightly projecting rim of lead kept the primer from being unseated by an unlucky blow, and in a magazine gun I should think it would prevent its being exploded by a blow from the butt of the succeeding cartridge. At the same time it does not injuriously affect the ignition of the primer, for in my opinion a bullet should not explode in an animal before touching a bone. There would be danger in one that did, and I would fool with no dynamite bullet.

The above described is as deadly a projectile as I would care to use, and I think one on that principle could be made for any rifle. Carefully planted, it would knock the life out of any animal that walks. Fired into a green white maple it exploded within an inch of the surface, and in the end of a dry spruce log on a line with the grain of wood within three inches. I have seen the main part of the bullet twisted into the form of a small rod of lead four inches long. If this description is not clear, and your correspondent would care to see a doctored cartridge, I could send one by express. L. I. FLOWER.

MACDONALD'S CORNER, N. B.

THE MEGANTIC CLUB.

A meeting for the purpose of organizing the Megantic Fish and Game Club, was held in the Parker House, in this city, on the evening of January 27. A number of enthusiastic sportsmen, who had visited the Megantic and Dead River Regions, and had enjoyed the rare sport that is offered there to all lovers of the gun and rod, had some time previously formed a temporary organization for the purpose of protecting the fish and game in that section, and as a result about 130 gentlemen had signified their intention of becoming members of the club when formed. The territory to be operated lies on both sides of the International boundary extending from the Spider Lake and Megantic region across to and including some of the Seven Ponds in Maine.

The party sat down to a beautiful dinner at 7:30 o'clock. It was expected that Col. Gustavus Lucke, United States Consul at Sherbrooke, P. Q., would preside, but in his absence Mr. Ubert K. Pettingill, of Boston, was elected chairman. It was voted that the association be called the Megantic Fish and Game Club, and that the objects of the association be the enforcement of the fish and game laws, the propagation of fish and game, the leasing, hiring and purchasing of lands and waters for hunting, fishing and shooting purposes.

The usual articles relative to the election of officers, qualifications for membership, etc., were gone through with and consented to as far as could be done at this meeting. It was discussed to place the capital stock of the corporation at $50,000 divided into 500 shares at a value of $100 per share, or a capital stock of $12,500 divided into 500 shares at a par value of $25, and subsequently place a premium upon the shares. In either plan it was decided to issue 200 shares at a value of $25, and after they were disposed of to issue 100 more at $50 per share; after these were all taken no more should be sold for less than their full value ($100), none of the remaining 200 shares can be disposed of till voted upon by the board of directors. This will give the club an available capital of $30,000, not including income yearly from assessments, and it was voted that an assessment sufficient to carry on the operations of the club, which, however, cannot exceed $10 in any one year, shall be levied on each share. To gain admission to the club a nine-tenths vote of all the members present at a regular meeting of the club is required, and the applicant must be the possessor of at least one share, but the possession of a share does not necessarily entitle a person to membership; in other words, any person may become a stockholder but not a member until he is voted in. The annual meeting of the stockholders must be held in Maine, the annual meetings of members and the annual dinner in Boston. The regular meetings of members for social purposes and receiving reports must be held on the second Tuesday of January, March, May, July, September and November; the May meeting in Sherbrooke, P. Q., the July and September meetings at the club house, the November meeting in New York and the remainder in Boston, which is constituted the headquarters of the club. Steps will be taken as soon as possible to incorporate the club under the juristion of the Province of Quebec. These officers were elected: President, Col. Gustavus Lucke, of Sherbrooke, P. Q.; Vice-Presidents, Ubert K. Pettingill, of Boston; I. O. Woodruff, of New York. Secretary, Heber Bishop, M. D., of Boston; Treasurer, Geo. C. Ainsworth, of Boston; Directors—Major W. A. Morehouse, Francis P. Buck, G. Henry Gorden and D. Thomas, of Sherbrooke, P. Q.; Hon. Henry Aylmer, of Richmond, P. Q.; Rufus H. Pope, of Cookshire, P. Q., and Alexander H. Ross, of Gould, P. Q.; Capt. C. W. Hinman, Erastus Willard, Dr. Fred A. Cook, Chas. S. Hanks, Col. S. Harrington, J. P. Bates and J. N. Frye, of Boston; Henry W. Nason, Prof. Alfred M. Mayer and John W. Mason, of New York; Clerk of Corporation, Mr. Harry Butler, of Portland, Me.

It was decided to leave the appointment of game wardens to the Executive Board, which will meet shortly, but at the urgent request of Dr. Bishop, who put forward the claim of the pressing needs of a paid warden at once, owing to the great depth of snow already in the region and the nearness of the close season, it was voted that the secretary be given the authority to select one warden on the Canadian side of the boundary at a salary not to exceed $2 per day, and his duties to commence immediately after receiving confirmation from Quebec. Dr. Bishop recommended Mr. Peter Matheson, of Winslow, P. Q., a former government game warden, for that situation, and he was unanimously appointed.

The appointment of a head fish and game overseer and resident manager was left over till the meeting of the Executive Board, together with other appointments of assistant wardens in Quebec and Maine. At this meeting also the constitution, by-laws, rules, etc., will be finally passed upon, leases and purchases ratified, the plans and specifications for the club house passed and a building committee and other committees formed.

It was voted that in consideration of the kindness and assistance rendered the club by Messrs. Chas. P. Hazeltine, L. A. Knowlton and Wm. H. Hall, of Belfast, Me., who have leased the exclusive hunting and fishing rights pertaining to their township, lying alongside the international boundary to the club, they be made honorary members with full privileges.

At the close of the meeting 155 of the 200 shares issued were taken by members and their friends, including a reserve for the directors in the Province of Quebec, and subsequently 15 more, and it is expected that the remaining 30 of the $25 shares will shortly be taken up. The company broke up a little after midnight feeling well pleased with the flattering success of their first meeting.

BOSTON, Mass., Jan. 31.

WHOOPING CRANES.

ONE evening in the latter part of November, 1884, (I was then living near the Missouri River) I took my single shotgun and my .32-cal. 18in. pocket rifle and went up to a small lake, expecting to get some ducks. Not finding any ducks on the lake and hearing some sandhill cranes making a good deal of noise out on the river, I went out to see if I could get one of them. When I came in sight of them they were in the edge of the water on the opposite shore from me and among them were four white cranes. As I had never killed a white crane I was particularly anxious to get one of these and wished for my .40-90 rifle, but had no great expectations of getting one with the .32 short. Walking up to within a few yards of the water I elevated the sights of the little gun, and drawing down to the barrel on the front sight, I fired at the nearest of the white birds, which I guessed to be about 100yds. away. At the report of the gun, the white cranes and a few of the sandhills rose and flew toward my side of the river, and when they came nearer I saw one of the white ones had a broken leg. They went down the river about 250yds. from me and the wounded bird settled in some shallow water, but the others went back to the main flock. I went down to get my crane, and as it was still able to stand I kept my shotgun at a ready; and when I came within perhaps 40yds. of it it got up and started for Mexico, but I sent a load of shot after it which caused it to come down before it had gone more than 250yds. It was not quite dead when I got to it, but was not able to fight. The rifle bullet had broken the left thigh and entered the cavity. It was a beautiful bird, and after taking it home I found that it measured 7ft. 2in. from tip to tip of wings and 5ft. 8in. from tip of bill to tip of toes and weighed 13lbs. It was larger than any sandhill crane I ever killed and was as good eating as the sandhills are. J. F. L.

SALEM, Nebraska.

Editor Forest and Stream:

In the FOREST AND STREAM of Jan. 13, Wells, of Victoria, Texas, asks how many of your readers have ever killed a whooping crane. I was up on the Platte in the spring of '84, trying to have some sport with the geese. One morning, soon after daylight, I discovered a pair of white cranes in some cornstalks a quarter of a mile away. My friend had a gentle old cow that I had successfully punched up within shooting distance of small flocks of geese, and I decided to try that scheme on the cranes. Just as I got the cow started and was stooped down to keep out of sight, in about as uncomfortable a position as can be imagined, my friend stepped out and said by way of encouragement, "You need not try that; men who have lived here fifteen years have never succeeded in getting a shot at one of those fellows." But with vigorous pokes of the gun barrel I went on with the cow until within about 100yds. of the cranes, when she suddenly changed her mind and ran away, leaving me in full view of the birds, which started at once. I shot the first barrel at one as they were leaving the ground, and although he was hard hit he got away; but the second one fell stone dead to the second shot with a No. 7 buckshot through the heart; distance (measured), 94yds.; weight a little over 19lbs. The toughest and most unpalatable bird any human being ever attempted to eat.

RANDOLPH, Ia. W. L. B.

CAMP GROUNDS FOR CHICAGO INQUIRER.—Fort Wayne, Ind., Jan. 24.—*Editor Forest and Stream:* In reply to inquiry of "Constant Reader," Chicago, Ill., for camping grounds, would advise him to go to the lakes of Steuben county, Ind. From Chicago take L. S. & M. S. R. R. to Waterloo, Ind., and from there to Pleasant Lake or Angola, distant but a few miles on a branch of L. S. & M. S. James Lake, near Angola, is all that can be desired, as is the chain of lakes reaching out northwest from Pleasant Lake. Hog Back Lake is a grand place to go to for hunting and fishing. Would be pleased to answer further if desired.—JOHN P. HANCE.

FEEDING THE QUAIL.

Editor Forest and Stream:

Now that winter is upon us with its snow and frost, poor little Bob White should receive a share of our attention, as sometimes he has hard work to get his daily rations. It is a charity to the little fellows to spare them a few quarts of grain during the winter, and in the summer they will return us thanks by piping a merry note on the old rail fence or stump of tree near our homes. A little chaff, mixed with some rye, wheat or buckwheat, or if chaff cannot be obtained, the sweepings of the hayseed from the barn floor, will help keep the little fellows from suffering and starvation. A pint of grain each day while snow and ice covers the ground will sustain fifty quail.

Care should be taken to feed them under heavy cover where hawks in passing over cannot see them; for where the hawk gets one to-day he will surely come again to-morrow. My way of feeding is to first find a heavy thicket of briers in the swamp or under hedges, and cut a small opening at the bottom, just large enough to get an old broom in. I sweep out the snow and lay the feed there. By scattering the chaff or hayseed around they will track it up and soon find the grain. It is a good plan to feed in the same place every day, provided it is where the hawks will not trouble them. Some parties make it a practice to put out cornstacks, and feed around the stacks, and make openings in the stacks for the quail to roost in. This, as I have learned by experience, is a great mistake, as the cornstacks always harbor mice, and in the night the cat, which is the quail's greatest enemy, prowls around the stack for mice and kills a great many quail, and finally drives them away from their feed altogether. It is also too exposed, as birds feeding on the snow show a great distance, and are an easy prey to hawks. I feed my birds every day all winter, not because it is necessary, but because I like to see them.

ALFRED A. FRASER.

THE CEDARS, Long Island.

THE NEW YORK GAME PROTECTOR.

Editor Forest and Stream:

Noticing recently your comments upon the non-enforcement of the game law, as respects ruffed grouse or partridge, I beg leave to send you herewith a communication received from the fish and game protector, Mr. Godwin, in answer to one of mine calling attention to complaints that had been made to me on the same subject.

It is a matter of considerable doubt whether any conviction could be secured under the present law, and I would say further that I have always found Mr. Godwin to be very prompt and active in noticing all infractions of the game law, and if you should have access to the District Attorney's office, I have no doubt you will find there several pigeon-holes full of complaints that have been made by Mr. Godwin, but which the District Attorney has not as yet found time to prosecute.

E. G. BLACKFORD.

NEW YORK FISHERY COMMISSION, New York, Jan. 26.

Mr. E. G. Blackford, New York State Fish Commissioner:

DEAR SIR—Your letter came duly to hand with one inclosed from the party living in Brooklyn, calling your attention to the fact that grouse were exposed for sale in the New York markets after Jan. 1, and wanting to know why the protector of game allowed it. Permit me to say in reply that at the commencement of the close season I had already found that they were so exposed, and upon investigating the cause found that a large number of dealers in game had letters and verbal opinions from a gentleman of this city (he being a lawyer and a prominent member of a game protective society, upon whose judgment and advice I think great weight should be given) that it was not probably intended under the law of 1886 to prohibit their sale during January, and he did not think it would be enforced. Such being the state of affairs I felt it necessary that I should, before taking any action in attempting to prosecute any one, seek proper advice in the matter, which I did, and found that under the letter of the law I had to prosecute. Such being the case I was not to be the judge, whether the law as it is was a good or a bad one; and not desiring to take advantage from any mercenary motive of the position the dealers had taken in good faith, and as I did not think it my duty to use my authority as protector to persecute them, I placed notices of my proposed action in the matter in several of the city papers, as you probably saw, giving them notice that the law required I should enforce the close season as it is on grouse. Since that time I have placed in the hands of the District Attorney of New York city suits for grouse in possession, the penalties of which amount to nearly $6,000. How soon any action will be taken and what disposition will be made of them, judging from the long delays in the number of cases I have already put in his hands for prosecution, I cannot tell. Respectfully yours, J. H. GODWIN, JR.,

State Game and Fish Protector for the Second District.

NEW YORK, Jan. 22.

AN EDITOR APPLAUDS FOR A POTTER.—The Hawkinsville (Ga.) *News* editor says: "Mr. W. A. Smith, of this county, gathered his gun on the day of the big snow and went out in the search of game. He struck the trail of a covey of partridges, and, getting the birds in a close bunch he pulled the trigger, killing ten. Pretty good for one shot."

GRAND RAPIDS, Mich.—The officers of the Kent County Sportsmen's Club for 1887 are: E. S. Holmes, President; L. D. Follett, Vice-President; A. B. Richmond, Secretary; N. Fred Avery, Treasurer; Directors, A. C. Horton, T. Stewart White, C. D. Spaulding, W. C. Dennison, H. Widdicomb. Practice shoots, Saturdays, P. M., during summer.

GRAND RAPIDS, Mich.—The officers of the Pottawattamie Club for 1887 are: President, E. S. Holmes; Vice-President, W. C. Dennison; Secretary, George H. Davidson; Treasurer, John Brennan. The directors are the above officers and Mark Norris and Henry B. Grady.

HAMMOND, Ill., Jan. 20, 1887.

U. S. Cartridge Co., Lowell, Mass.:

DEAR SIRS—To-day I made a test of shells and settled in my mind a long disputed fact in regard to the amount of times the U. S. shells could be reloaded. I took five shells from a box of 100, and shot them as fast as I could get them reloaded. The following is the result: First shell, 9 times; second, 11 times; third, 10 times; fourth, 13 times; fifth, 9 times. I could have loaded and fired some of them again, but the above result settled the question of their reloading qualities in my mind. I am sure all hunters and shooters ought to know of the good qualities of this shell, and I give you liberty to publish this, and will further say I am not in any way interested in any shell company, and give this letter for the benefit of all sportsmen. I am sure we are all seeking for the best, and if I can assist any one to find the best I will gladly do so, and this is my reason for sending your company this letter. Wishing you every success, I am, yours truly,

(Signed), L. S. CARTER.

THE MASSACHUSETTS ASSOCIATION.

THE thirteenth annual dinner of the Massachusetts Association for the Protection of Fish and Game was given at the Parker House, Boston, Tuesday evening, Jan. 25. President E. A. Samuels presided, and among the guests of the evening were Lieut.-Governor J. Q. A. Brackett, Hon. Halsey I. Boardman, president of the Massachusetts Senate; Fish Commissioners E. B. Hodge and Geo. W. Riddle, of New Hampshire, H. Brainerd, of Vermont, and E. A. Brackett. F. W. Putnam and E. H. Lathrop, of Massachusetts; Hon. Chas. Levi Woodbury, Hon. Patrick D. Dwyer and Mr. Chas. B. Reynolds, editor of the FOREST AND STREAM.

An unusually large number of members and others were in attendance, the list being as follows:

J. F. Stetson,	R. H. Jenness,
William F. Ray,	C. A. Lewander,
Charles J. McKenzie,	R. H. Fuller,
George W. Wiggin,	J. R. Glover,
Walton C. Taft,	William Prior,
A. B. Bradstreet,	G. H. Morey,
Joseph Warren,	D. T. Curtiss,
Samuel Hanson,	George A. Moore,
F. H. Johnson,	Herbert A. Rhoades,
S. M. Johnson,	Waldron Bates,
W. R. Davis,	Frank E. Simpson,
Francis Fitz,	H. H. Kimball,
Joseph Guild,	H. C. Litchfield,
James N. Frye,	C. G. Gibson,
Luther Little,	A. L. Carpenter,
James H. Jenkins,	A. W. Robinson,
Winthrop M. Merrill,	Mark S. Field,
C. A. Jones,	Nathan D. Blake,
Jay C. Smith,	Charles M. Blake,
E. B. Newton,	Levi L. Cushing,
B. C. Johnson,	George O. Sears,
J. R. Johnson,	William F. Alney.
Marshall Johnson,	Albert C. Hill,
J. H. Freeman,	E. R. Hunnewell,
Charles O. Pratt,	J. Walter Sanborn,
D. F. Eddy,	George W. Wadsworth,
James Zenas Loring,	George Loring,
J. W. Roberts,	Gen. Joseph R. Scott,
A. C. Walker,	F. R. Shattuck,
H. L. Roberts,	B. C. Clark,
Wesley Jones,	E. E. Small,
B. F. Nichols,	W. Hapgood,
Rollin Jones,	Charles Darrow,
Charles D. Appleton,	William S. Hills,
E. S. Tobey,	Thatcher Magoun,
Dr. W. S. Stroms,	John P. Woodbury,
Wm. H. Parmenter,	Charles E. Lauriat,
J. Allston Newhall,	Henry R. Beal,
Col. H. T. Rockwell,	William A. Garbett,
Walter W. Brackett,	Thomas J. Holmes,
John Fottler, Jr.,	A. M. Davenport,
O. P. Ricker,	Charles I. Goodall,
H. J. Thayer,	James Russell Reed,
John C. Tripp,	Chas. Langdon Gibson,
A. T. Jenness,	Capt. Gould.

The address of President E. A. Samuels was as follows:

"Gentlemen: It is again my pleasant duty to extend, in the name of the Massachusetts Fish and Game Protection Association, a most cordial welcome to our friends who are with us here this evening. We may all be proud, gentlemen, of such a gathering, for it shows that, although we are now one of the veteran associations, this being the 13th year of our existence as a society, we are not losing our interest in the objects for which we exist, but that we are as enthusiastic as ever in the work we have undertaken to do. The presence of so many distinguished gentlemen from far and near is also an encouragement for us and an assurance that our labors are appreciated by an intelligent portion of the community. The results of our past year's work are second in importance to none in the history of this association. Thanks to the labor of members of this association, in and out of the Legislature, we have at last on our statute books a wise, a strong law, a law for the better protection of our game and insectivorous birds that can be enforced, and we will cause it to be enforced, if work will do it. Already have we attained most encouraging success in the prosecutions of offenders, and we now see no loophole for the escape of evildoers. Our present law is, in my judgment, the best we have ever had, but it is not perfect. A provision that allows the selling of quail until May 1 is not wise, for so long as there is a market for any quail for four months after our close season begins, our own birds will be killed and sold. It is impossible, or next to impossible, to prevent it. In my opinion the near and utter extermination of this beautiful bird in this State is assured if the market is not shortened very considerably. I believe, however, it is the best judgment of this association that we had better be content, for the present, with the law we have, good as it is in nearly every respect, rather than endanger its many good features by endeavoring to have it perfected.

"The gradual but certain decline in our lobster fishery indicates the near exhaustion of one of the choicest and most valuable food products of our waters, the increase of demand, caused by a rapidly growing market, is telling surely upon the supply, and unless a halt is called, the lobster will become a luxury obtainable only by the wealthy. Modern methods of refrigeration and transportation have created a demand that is insatiable, and unless there is by law an absolute close season adopted by all the States that possess a lobster fishery, there will, before many years, be no occasion for such a law, for there will be practicably no lobsters to save. The Fish and Game Commissioners for this State favor the establishment by law of a close season during the most critical egg-bearing period, and our association will do a good work in advocating such a measure before the proper committee of the Legislature.

"The calls on us in various ways have been so many and so urgent that our expenditures have been unusually heavy. The money, therefore, that has been donoted to us by a number of friends came most opportunely, and the donors are entitled to the lasting and most sincere gratitude of our society."

Mr. Samuels then called upon the guests present, interspersing their speeches with the apparently inexhaustible flow of his own stories and wit and wisdom. What the speakers said was summarized as follows in the next morning's *Herald:*

Lieut.-Gov. Brackett was loudly applauded, and after thanking the association for the honor done him and extending to it the good wishes of the executive of the commonwealth, said that the society was organized for the promotion of the public good, and for the enforcement of the laws for the protection of fish and of game. Ignorance of the law excuses no man. If you shoot a book agent or a lawyer, or any other man who seeks to do you good for a slight pecuniary compensation, it is no excuse for your doing so ungentlemanly an action that you are ignorant of the law. In diffusing knowledge of our game laws you are doing a good work. Mr. Brackett then read extracts from the game laws, giving the various dates between which the killing of certain kinds of birds is prohibited, and humorously depicted the perplexities of a sportsman who goes hunting at almost any time during the year. "He sees two birds on a branch," said Mr. Brackett. "He looks at his calendar to see what day of the year it is, and then at his copy of the game laws, constantly carried in his hip pocket, and then he says to one bird: 'I'll see you later,' and to the other, 'Your time has come.' This association is doing worlds of good in disseminating knowledge for the benefit of the sportsman. Becoming serious, Mr. Brackett commended the association for its work in enforcing the laws, and wound up with two or three good fish stories, and urged his hearers to go on promoting the public good of the commonwealth as they have been promoting it in the past.

President Boardman of the Senate followed in a felicitous address. He remembered the work which President Samuels had done, and done so well, two years ago, for the protection of game. He told some good stories of his own early hunting experiences, and said he had come to the conclusion that hunting was not his best hold. He doubted if all present had caught as much fish or shot as much game as they had eaten to-night, but this all goes to prove the disinterestedness of the members of the association. He painted in bright colors the pleasures of hunting and fishing, and thought that their reward, if it did not come through well-filled bags, it might at least be found in rounded cheeks, elastic muscles and glowing health. He said that in an economic point of view, it is more important to preserve the fishing interests of Massachusetts than the game. The use of traps, seines and weirs would result in the killing of the goose which lays the golden egg if not speedily checked. The work which the association attempts to do is of great difficulty and of great value. Whatever of judgment and study can be brought to the question are all needed to secure the purposes which these gentlemen are struggling for. Mr. Boardman promised his hearty co-operation in the good work being carried on by the association, and sat down amid applause.

Mr. E. B. Hodge, Fish and Game Commissioner of New Hampshire, said that the good which such an association can do is illimitable and can never be reckoned up in dollars and cents. Who can calculate the amount of work done in unseen channels by deterring men from breaking the game laws? Referring to what had been done in New Hampshire, Mr. Hodge said that a law had been passed prohibiting the exportation of game birds from that State, and had resulted in decreasing the snaring of those birds some seventy-five per cent.

Commissioner Geo. W. Riddle, of New Hampshire, said that the influence of the association had extended all over New England, and that New Hampshire's commissioners would endeavor to do all in their power to assist the society in its work.

Prof. F. W. Putnam, of Cambridge, followed in a brief speech. It had been a part of his work, he said, to get the fishermen of the State to make returns of the number of fish they catch. If is very difficult to make the fishermen understand the importance of making such returns. The statistics show that not only are the lobsters doomed to go, but all the fishes in our waters are bound to go with them, unless some measures are taken to stop their ruthless destruction. The seines and the pounds are very dangerous to our fisheries. Something must be done by the Legislature to restrict their work of destruction, and protect the fishes in the bays as well as in the streams. The salmon have already been brought back to the Merrimac, and something should also be done to get the shad back into our streams. It remains for this association to create a healthy public sentiment, which will bring to our statute books laws relating to fisheries even better and more stringent than those relating to the protection of our game.

Hon. Charles Levi Woodbury talked about deep-sea fisheries. He brought out a hearty laugh over the adventures of Captain Jonah of Biblical fame, but said that those stories were nothing in comparison to those narrated by the two modern Bracketts. The lobster was learning something. He could shrink up into a 10-in. limit in the trap and get himself thrown over again to be given a chance to grow. There are hopes that either this or the next Congress will pass some law for the protection of the mackerel in the spawning season. He thought that a short close season should be established. The sea fishery has to proceed slowly and carefully. Two years ago, at a meeting of this society, a movement was inaugurated to protect American fishermen. Where are we now? Last night the telegraph brought us the glorious news that the Senate, by a vote of 47 to 1, had agreed to stand by the American fishermen. The same bill will probably go through the House, and we shall see that the whole power of the United States will not only protect the fish, but will protect the fisherman as well.

Mr. A. Brainard, Fish and Game Commissioner of Vermont, came next and spoke of the hand-to-hand contests which the officers had had with poachers at home and the great difficulty which the Commission had encountered in enforcing the law. Vermont has a law prohibiting the snaring of game birds, he said. He humorously referred to the gigantic lobster industries of Vermont and sat down amid shouts of merriment.

Mr. Chas. B. Reynolds congratulated the Massachusetts Association on its persistence in good work and said its influence cannot be bounded by Massachusetts or New England, but radiates throughout the country.

Mr. E. E. Small spoke of the protection of the deep-sea industries. There is not one law upon our books for the protection of the great staple fisheries, he said. He advocated a law that would prevent the setting of a trawl in Massachusetts Bay for ten years, a law which would prevent seining during the spawning season of the mackerel. The mackerel are hounded throughout the whole season. Every barrel contains from 30,000,000 to 40,000,000 eggs. It is an experiment worth trying to give these fish a chance to deposit their eggs, and see if the mackerel catch cannot be increased thereby. During April and May the haddock throw their spawn, and should be protected. Let the society do its best to create a healthy public sentiment in this matter, which will bring the needed legislation. Referring to the international question, he said the Senate has at last passed a law to the effect that every American seaman is an American citizen and every American shall be protected, and congratulated his hearers on the brighter outlook for the American fisherman on account of this manly stand.

Commissioner Lathrop, of Massachusetts, wanted to enforce the lesson that the primary object of the association was to educate the public as to the importance of the preservation of fish and game. From this city has radiated over the country the sentiment that the song birds of America must be preserved. He then spoke of the protection of salmon in the Connecticut River, and said it had been the effort of the Commission to educate the people at the mouth of that river to aid Massachusetts in the protection of these fish. The Massachusetts Commission has become tired of putting fish into the river only to have them fall into the traps and pounds of the Coenecticut fishers, who are killing the goose which lays the golden eggs. To protect game birds, educate people not to eat game birds out of season, and then Boston will no longer be a "dumping ground for the game birds of the West." Let the Western States enforce non-export laws, and they will need no longer to complain of the "dumping grounds of Boston."

It was a representative gathering of Boston's business and professional men, whose dignity would have graced any assembly even though convened for graver purposes than this festal gathering, where the talk was of field and stream experiences, and to "give and take" fish stories was the rule of the hour. There was a noticeable proportion of silver-haired gentlemen among the hundred odd who sat down to the two long tables to discuss the menu. The menu cards bore original and handsome designs, provided for the occasion by Messrs. Beckman and Punchard, the Parker House, proprietors and the menu was as follows:

* MENU. *

Blue Points, Deep Shell.

SOUP.

Green Turtle. Puréc Game.

FISH.

Chicken Halibut, à la Hollandaise. Smelts, à la Tartare.

REMOVES.

Saddle Venison.

Wild Goose. Capon, Purée Celery.

ENTREES.

Oyster Croquettes, Bechamel. Chartreuse Grouse.

Lobster Croquettes, Cardinal.

Spaghetti, au Gratin. Fried Bananas. Apple Fritters, Wine Sauce.

Roman Punch.

GAME.

Redhead Duck. Black Duck. Quail.

SWEETS.

Charlotte Russe. Omelette Soufflée. Grape Meringues.

Biscuit Glacé.

Oranges. Bananas. Apples. Grapes. Dry Fruits,

Ice Cream. Sherbet. Coffee.

THE OHIO ASSOCIATION.

AT a meeting held at Columbus, O., Jan. 12, the Ohio Game and Fish Protective Association was organized. The convention was attended by delegates from a number of clubs from different parts of the State, the Sherman Gun Club, of Columbus, taking prominent part. The objects of the association are set forth in the constitution:

ART. II.—The object of the Association shall be the protection and increase of game and fish, the bringing about of the enactment, by this and other States and Territories, of laws for the protection and increase of game and fish, and for the better enforcement of such laws.

Officers were elected as follows: President, Gen. W. B. Shattuc, of Cincinnati; Secretary and Treasurer, Dr. Wm. Shepard, of Columbus; Corresponding Secretary, Geo. L. Graham, of Columbus. Vice-Presidents: District No. 1, J. P. Murphy, Cincinnati; No. 2, Col. L. A. Harris, Cincinnati; No. 3, Seth W. Brown, Lebanon; No. 4, Edwin Best, Dayton; No. 5, 6 and 7 were the only ones not represented by appointees; No. 8, H. B. Ingalls, Huntsville; No. 9, Dr. T. B. Cotton, Mt. Vernon; No. 10, E. D. Potter, Toledo; No. 11, Hon. J. A. Turley, Portsmouth; No. 12, A. D. Corwin, Waverly; No. 13, C. H. Damsel, Columbus; No. 14, W. P. Mickey, Shelby; No. 15, C. E. Vergess, Lowell; No. 16, E. Z. Hays, Coshocton; No. 17, W. H. Gorbey, Bellaire; No, 18, L. C. Cole, Massillon; No. 19, Jules Vautrot, Warren; No. 20, Dr. W. C. Jacobs, Akron; No. 21, E. C. Beach, Cleveland. Law Committee: J. P. Murphy, Cincinnati; E. L. Taylor, Columbus; H. B. Ingalls, Huntsville; L. D. Waters, Akron; W. H. Harris, Cleveland. Delegate to attend the convention to be held at Ionia, Mich., Mr. W. R. Leflet, of Toledo; delegate to represent the Association at the National Association, B. F. Seitner, of Dayton. The next annual meeting will be held at Dayton, January, 1888.

OLD AND NEW RIFLES.

Editor Forrest and Stream:

These long winter evenings give one ample time to review, in memory's mind, the many hunting scenes of years gone by, as well as to post up on the improvements constantly being made in the utility of arms. To hold trade old firms of standing and reputation are compelled to be up and doing. In reviewing an article from the pen of J. J. M. in Dec. 31, 1885, number, I am led to think his ideas in answer to "Mississippi Lowlands" and Mr. Van Dyke, were well taken, and would apply with equal force to counteract certain statements recently made as to the wonderful merits of the muzzleloader as a hunting gun. Surely the day for selling muzzleloading hunting rifles is past; all admit that. It has been a nauseating pill for the muzzleloading devotees to swallow, and as might have been expected, drew forth from a certain few all the invective threats imaginable. The breechloader, however, has come to stay, and is well liked. It has the merits, and as J. J. M. remarks, what the late arm now being furnished the English army did at Enfield, putting ten consecutive shots into a card 5×9in. at 500yds., proves that there is nothing in the mere

mechanism of the breechloader to prevent its fully equaling the accuracy of muzzleloaders.

It is claimed that the muzzleloader made the flattest trajectory in the FOREST AND STREAM test at 200yds., and is for that reason the best hunting rifle. By referring to that report I notice that a muzzleloading gun of 14lbs. 12oz. weight, charged with 130grs. of powder to 270grs. of lead, made a trajectory at 100yds. of 6.399in., while a breechloader, double-barrel, of 8lbs. 13oz. weight, with 110grs. powder and 310grs. lead, made a trajectory over the same distance of 7.930in. Now I ask, with all candor, what the probable effects would have been had the powder and lead been changed from one gun to the other before firing? Does any one suppose that the results would not have been changed? If not, then why was this target rifle, burning almost one of powder to two of lead thrown, put into competition with light guns throwing from three to four times as many grains of lead as they burned of powder? Secondly, if some of the many firms of breechloading guns had anticipated the catch and sent in a 20lbs. gun loaded with 150grs. powder and carrying a ball of 200 or 250grs. lead, and it had reduced the trajectory down to 5in. at 100yds., would it be good argument to say that the breechloader was the better gun for hunting for this reason only? I think not, as I have yet to learn that the ratio of one of powder to two of lead, may it be ever so necessary, can be used to advantage in either breech or muzzleloading hunting rifles. For example, take a .40-cal. gun weighing 8½lbs., about the standard weight of English guns, load it with 60grs. of powder and 120grs. lead and you have all the recoil allowable to do good work, while the ball is entirely too light for hunting deer or doing steady work at target. What is the remedy? Cut down the powder charge and increase the lead, when it will suit nine customers out of ten. It is the same in furnishing a gun for the plains. While they order a 10lbs. gun carrying 60 to 90 grains powder, a ball of 180 grains would not suit them. Trajectory is sacrificed for more lead. Many prefer a ball of 400 to 500 grains in weight. Put one-half this weight of powder behind the ball and we have 200 or 250 grains powder. This would require a gun of more ponderous weight than one hunter in a thousand would like to go hunting with. Any firm turning out such ponderous weapons would soon be compelled to go into bankruptcy for lack of custom. And still it is possible that now and then an enthusiast could be found writing columns in praise of them. Claiming that they could be used equally well for hunting game, or with extreme accuracy at target. I don't think from what I can learn, however, that the change would warrant many firms in ordering new, or repairing old machinery to fill all O. K. orders received for this class of work. The position is so ludicrous and untenable that only a certain few extremists ever venture to uphold it. It would be like Bogardus substituting the old Queen's arm for one of W. W. Greener's late hammerless ejector guns before going into a glass ball match with some worthy competitor striving for champion honors. CAP LOCK.

FREWSBURG, Jan. 26.

Sea and River Fishing.

Address all communications to the Forest and Stream Pub. Co.

THE ONEIDA LAKE NETS.

Editor Forest and Stream:

I have received several copies of your paper containing an article headed "Good for Nothing Game Protectors," and in reply thereto beg leave to state a few facts, so that if you have occasion to again write upon the subject you may not unwittingly repeat the injustice of your editorial of Jan. 6.

When I commenced work on Oneida Lake there was only one bay that was not crowded with nets, and it was stated, I believe, that any man's life was in danger who should be bold enough to interfere with these nets. It was rarely they were disturbed, and even then only under cover of night or by parties sufficiently strong to repel any attack upon them by fishermen. The vindictiveness of these men to any one interfering with these nets is well known, not only at Oneida Lake, but on all other waters whether in New York, or Maine or elsewhere. It follows as a sequence, and seems to be an inherent trait of character that when their illegal business is disturbed, boats have disappeared, cattle have been killed, barns and belongings to persons believed to have opposed or interfered with these desperadoes, have been burned. In the face of all this and against the advice of friends I undertook to break up and prevent netting in Oneida Lake, and on several occasions did risk my life in seizing nets, and time and time again was warned and threatened.

For two years before my appointment I worked without compensation, when I could have received hundreds of dollars if I had abandoned the lake. I was, however, determined to carry out my work, but at the time of my appointment I had learned from experience that neither I nor any protector could do effective work without other facilities than a mere rowboat and a single assistant. You will readily see that looking after thirty miles of water, covering over fifty thousand acres, is no boy's play; and will just as readily appreciate the absolute necessity of a steamboat to meet the emergencies. Unfortunately, the State of New York does not furnish steamboats, and I must do so at my own expense or abandon the work. No person familiar with Oneida Lake, its length and breadth and numerous bays and uncertain water, would expect me or any protector to accomplish decided work with ordinary facilities; but with a steamer bought with my own money, manned by my own paid help, without one dollar of expense to the State, and with only slight assistance from any person, it is expected and demanded that I shall use my boat for the exclusive benefit of the public, and failing to do so I am excoriated, spitted and condemned.

It may be thought a good joke by some, but it is not a pleasant or consoling situation to be awakened in the dead of night to find the incendiary with torch in hand to burn your house. Yet that is just what occurred on my boat. It is not one of the hopes of life, while doing your duty, to be met with a Winchester in the hands of a desperado who threatens to make a target of you. Yet that is just what occurred to me on the banks of Oneida Lake, while attempting to enforce the laws forbidding illegal fishing. It is not quite so comfortable and restful to remain in a swamp at night in the rain, to get evidence against men having no regard for law or the rights of others, as it is to be under your own roof with peaceful surroundings. Yet that is just what I have done these last three years time and time again.

I would have you bear in mind that the most of the nets used in Oneida Lake have leaders from thirty to forty rods in length, with traps that will hold a ton of fish, and that to raise these traps to the deck of the steamer requires the combined efforts of three men, and that such nets are sure death to all fish, except the smallest, the only consoling thought connected with them being the fact that these identical fish, so caught, find a ready market in the city of New York.

In 1883 I captured 21 of these large nets, besides a number of smaller nets, and commenced several suits for penalties in Oneida, Onondaga, Oswego and Madison counties. In 1884 I captured 57 nets valued at over $3,000. In 1885 I captured 84 nets valued at over $3,500, and in 1886 I captured 57 of these nets in Oneida Lake, probably worth $2,500.

Since the purchase of my steamer I have used it over 100 full days in doing my official duty, and that, too, without one dollar of expense to the State, and with no further compensation than that received by any other protector.

I have now awaiting trial five cases in Onondaga county, seven in Madison, and eight in Oswego; with all of which I have thus far borne the traveling and hotel expenses of my witnesses, and it is in only one case that any of these counties have been called upon by the District Attorney for an advance of trial expenses; although the law expressly states that the District Attorney may do so. My actual expenses for 1886 exceed my allowance $111.69, and I have yet to look after the several cases referred to above.

It is true the counties are liable, to an extent, for services rendered in their boundaries, but the economic spirit so prevalent in all county boards asserts itself in auditing the accounts of game and fish protectors. For instance, one of my accounts of $28 was reduced to $9, and this is illustrative of others.

The simple, plain, unvarnished fact is, that the State appropriation is not commensurate to the absolute necessary expenses and services and time of capable men.

So you see that the road to Jordan is really rough and hard to travel. I neither ask nor expect any consideration or commendation to which I am not justly entitled, and by all sense of honor and right I should not be condemned unless I am guilty. WM. H. LINDLEY,

State Game and Fish Protector.

CANASTOTA, N. Y., Jan. 24.

SYRACUSE, N. Y., Jan. 27.—*Editor Forest and Stream:* Mr. Lindley has just got a judgment of $100 and costs each, against six men, for fishing with nets in Oneida Lake. I write this that you may know that he is not idle, although apparently so to some.—ONEIDA.

LANDLOCKED SALMON.

Editor Forest and Stream:

Permit me to trespass on your columns, so far as to ask a little more light on the habitat of the above named variety of the species *Salmo*. When I read your statement a short time since, that "he was a native of the State of Maine and did not exist elsewhere except transplanted," I mentally added, "in the United States," after elsewhere, supposing that to be your meaning, as I do now. Now in your columns of Jan. 6 both Mr. Hallock and "Monatiquot" give a pretty wide range to this species, which agrees exactly with verbal information given me by Commissioner E. B. Hodge, of New Hampshire, who has taken them in the very waters mentioned by "Monatiquot".

Mr. Hallock, in his "Gazetteer," also speaks of them as found in the Averill Ponds, in northern Vermont, near the Canadian line, and I have been told that they are also found in Maidstone Lake in northern Vermont, about twenty miles south of the Averill Ponds. These are the only two places "in the United States" where I have ever heard of them being taken, except in Maine, until they were planted in them.

I have already written you of the great improvement in size produced by transplantation of this fish from Grand Lake Stream to Squam, Newfound and Sunapee lakes, and I believe that this difference in size is the only reason for the statement that there are two varieties of them in Maine. Now, I know nothing about them personally, except in Maine and New Hampshire, but I have formed the idea that they are a distinct and widespread Boreal or almost Arctic variety of *Salmo*, found only in one or two instances south of latitude 45, as in Sebago Lake, which is about on the 44th parallel, but known to exist in various places in the British Dominions and likely to be found in many more. I have very great doubts about there being any "landlocking" about it, and am very sick of the jaw-breaking misnomer, as I consider it. We might as well call it by its Indian name, the winninish, as call the great lake trout *Salmo namaycush*.

Again, in your issue of Jan. 20, is another letter from Mr. L. H. Smith speaking of the trout of Lake Superior, in which he says he may have made a mistake in calling the red trout of that lake, the lake, the landlocked salmon, and in your comment you state that there are only two varieties of lake trout in Lake Superior, viz.: the *namaycush* and the siscowet. Now, in Messrs. Orvis & Cheney's "Fishing with the Fly," in the article entitled "A Trouting Trip to St. Ignace Island," the author gives on page 100 a list of ten local names for varieties of trout found in the lake, and which he suggests are partially hybrids, but in which in addition to the "lake trout," or *namaycush*, and the siscowet, he also mentions the red trout or "pugwashoo'neg," and speaks of the high color of its flesh and its superior excellence for the table.

Again, on pages 113–114, he refers to it as being spoken of by the local fishermen as a landlocked salmon, and of its remarkable similarity to the *Salmo salar* of the St. Lawrence, or even more to the one of the Frazer River.

Now, I can see no similarity in the mottled and vermiculated livery of any of the proper fresh-water trouts, with these yellow spots, even if they have not the crimson ones, to the sober black and white garb of the true salmon or his fresh-water cousin, whom we now have under consideration, nor can I consider it possible for any mistake to be made about this matter of resemblance, and I fully believe that careful research will locate the *Salmo winninish* all the way north of latitude 45° or 46°, from the Atlantic to the Pacific. Mr. Hallock knows more about him than almost any one, and I hope he will give us some more light on this subject and the benefit of his opinions on the question. Tell your correspondent "Mabie," of Whitby, Canada, that if his trout has red spots and a square tail, he is a brook trout; if yellow spots only, and a forked tail, he is a lake trout, or *namaycush*.

VON W.

CHARLESTOWN, N. H., Jan. 28.

[Our late ichthyological writers, Bean, Jordan, Goode, and others whom we follow, give only three trouts to Lake Superior. These are the brook, the lake, and the siscowet, and Jordan ("Synopsis of the Fishes of North America") says of the latter, p. 318: "It is probably a local variety rather than a distinct species."]

LOCH LEVEN TROUT.

THIS variety, or species, for its exact status is now in dispute by the anglers and ichthyologists of Great Britain, is a trout which takes its name from the lake in Scotland where it is found. It is described by Günther ("Catalogue of Fishes of the British Museum") as a distinct species under the name of *Salmo levenensis*, but it is claimed by many that they are identical with the common brown trout, which is the brook trout of Europe, *Salmo fario*. Others go still further and claim that the sea-trout, *Salmo eriox*, and the Great Lake trout, *Salmo ferox*, are all identical with the brown trout, but vary in form and color only.

At the Howietown fishcultural establishment of Sir James G. Maitland, at Stirling, Scotland, the Loch Leven trout has been selected as the best of all the species for cultivation. The hatchery is about twenty-five miles from Loch Leven, and being the same elevation, the temperature of the water is about the same. Last year Mr. Maitland presented a quantity of eggs of this fish to Prof. Baird for the United States Fish Commission, and these on arriving at Cold Spring Harbor were sent according to orders from Washington to Mr. Frank N. Clark, at Northville, Mich., and to the hatchery of the Bisby Club in Oneida county, of which Gen. R. U. Sherman, of the New York Fish Commission, is president. None were retained at the Long Island hatchery because they had been supposed to be a trout requiring the deep waters of lakes, a belief which was afterward found to be incorrect, as it was learned that the fish had been introduced into the streams of England.

As near as we can learn at present, outside of form and color, the only difference between the Loch Leven trout and the brown trout is in cæcal appendages to the stomach, those blind sacks which have a vermicular appearance, and if this be true we should not think this one fact of importance enough to give them specific rank, and that their proper designation in this case would be *Salmo fario* var. *levenensis*.

Sir James G. Maitland has this winter presented to the United States Fish Commission 48,000 eggs of the Loch Leven trout, which sustained some damage to the upper trays in transit, but of which about one-half will be saved. These have been assigned by Prof. Baird to the Cold Spring Harbor station, where they are now in process of hatching.

At a meeting of the Linnean Society, of London, last month, Dr. Francis Day read a paper on the Loch Leven trout, in which he said: "These fish are known by their numerous cæcal appendages, and up to their fourth or fifth year they are of a silvery gray, with black, but no red spots. Subsequently they become of a golden purple, with numerous black and red spots. Undergrown ones take on the color of the burn trout. Remove these fish to a new locality, and they assume the form and color of the indigenous trout. In 1883 a salmon parr and Loch Leven trout were crossed, and the young have assumed the red adipose dorsal fin, and the white-edged margins to the dorsal and ventral, also the orange edges to both sides of the caudal—all colors found in the brook trout, but not in the salmon or Loch Leven tront. The maxilla in this form not extending to behind the eye, the absence of a knob on the lower jaw in old breeding males, and the difference in the fins from those of *Salmo fario*, were shown to have been erroneous statements."

IMPROVED SALMON.

Editor Forest and Stream:

A new and interesting problem in fish propagation has come up, growing out of the fact that the salmon which enter the Restigouche River in Canada, being of as many different sizes and clans as there are tributaries of the main stream, are used indiscriminately by the government fishculturists for breeding purposes. There are in all five (5) clans, and the question at issue is, whether the fish are likely to deteriorate or improve by the miscegenation. My attention was first called to the subject by Dr. J. H. Baxter, U. S. A., of this city, who owns a magnificent fishing privilege on the Restigouche, and he has submitted to my examination some correspondence and references which show that it has already received some incidental attention from U. S. Fish Commissioner Baird, State Commissioner Atkins, of Maine, Gen. W. Y. Ripley, and several others interested in fish propagation in this country and Canada. This simple statement, as I have written it, is of itself of sufficient interest for comment, as the investigations which are likely to result from incipient inquiry will probably lead to something of practical value in the production of estimable fish stock. When they will materialize for permanent economic advantage is a question of time and patient study.

Physically, as far as experiments have reached, the effect of introducing new blood in breeding animals and crossing plants of the same species from different localities, is found to tend toward improvement; and this is the written opinion of Commissioner Atkins, in respect to salmon; referring, I assume, especially to their commercial and edible qualitities. There are others who hold to the belief that mixed fishes—large stock crossed with small—must be of inferior size, and more than that, deficient in the game qualities demanded for good sport. They claim that observation has discovered that such products are hybrids, barren and bereft of the natural instinct or desire to return periodically to the sea after spawning, though I think this has not been sufficiently proven. Such opinion, however, is based upon the asserted fact that the number of kelts (spent fish which remain in the stream without going to salt water) is annually increasing, and that the average size of Restigouche salmon is less than it was six years ago, and that their game qualities are less conspicuous than they formerly were and at present quite inferior to those of the salmon of the York, Dartmouth, Marguerite and other rivers, where artificial propagation is not prosecuted to a like extent, or not at all.

All the foregoing testimony has its value. The facts must be accepted, while the inferences to be drawn may vary. Without professing to be wiser than other men, and not being a practical fishculturist, although I have watched the progress of fishculture from its beginning on this continent, I am free to say that the pith of the question immediately lies as between the inherent superiority of wild salmon over those which are, so to speak, domesticated; of those which breed naturally and feed naturally over those which are manipulated and to a certain extent fed. There are some, indeed many, ani-

mals and plants whose quality and traits are improved by cultivation and domestication, but salmon do not come under this list. Their natural virility and *elan* are "improved" out of them. I have no doubt that domestication tends to eliminate the instinct to go to sea, so that they stick to their flesh-pots just as domesticated wild geese do to the barnyard. Their edible qualities may be improved, in the opinion of some, but their characteristics will be changed. Even their size may be increased, like stall-fed cattle; but like deer in a paddock, or falcons on the wrist, their natural traits are modified. They are genuine *ferœ natura* no longer. Their "game qualities" are gone. I have no idea that the salmon products of crossed clans are barren, but it is quite probable that the instinct of procreation is suppressed—first by the unnatural alliance; second, by the artificial manipulation; and third, by the loss of generative energy resulting from prolonged absence from the salt water.

Günther, I see, notes a marked frequency of hybridism in the salmon family, with regard to which he says: "As with other animals, the more certain kinds of fishes are brought under domestication, the more readily do they interbreed with other allied species. It is characteristic of hybrids that their characters are very variable, the degrees of affinity to one or the other of the parents being inconstant, and as these hybrids are known readily to breed with either of the parent race, the variations of form, structure and color are infinite." Promiscuous breeding is assuredly less desirable than selection, and it may at least be said with regard to the progeny of the mingled clans of the Restigouche, that the type will not be constant or the size uniform, but will indrive rather to variations such as we perceive, for instance, in the human family, where strains are not generally respected.

Washington, D. C. Charles Hallock.

SALMON IN THE HUDSON.

Editor Forest and Stream:

I have just read the letter of Mr. Chas. T. Bramble, in last Forest and Stream, pleasantly commenting upon my communication to the Eastern New York Association, and I will explain why I drew the conclusions that I did in regard to the presence of salmon in the lower Hudson in September. Prof. Goode says: "In America the southern streams seem to yield the earliest fish (salmon). In the Connecticut they appear in April and May, in the Merrimack in May and June, in the Penobscot most abundantly in June and July, although some come as early as April, and in the Miramichi from the middle of June to October. I can only account for this seeming paradox by the theory that, while salmon are not harmed by extreme variation of temperature, they may be averse to sudden changes, and though strongly impelled to seek the spawning grounds, are prevented by the cold."

From the above Mr. Bramble will see that what may be true of the movements of salmon in one river may not be true of the movements of salmon in another river far removed.

Prof. Goode does not state that salmon come into the streams that he names at other times than during the months given, nor does he state that they do not; but I assumed that they did not in any appreciable quantities. I was the more ready to do this because, in the case of the Miramichi, at least, the limits of the salmon run seem to be given.

If this is true my conclusions are sound and in no way differ from the observations of Mr. Bramble (which are corroborated by Prof. Goode as above), for the Hudson is located further south than any of the rivers named in the quotation, and certainly the run of salmon should take place as early in this river, provided it was a salmon stream, as in the Connecticut, and should extend no later.

Glens Falls, N. Y. A. N. Cheney.

WAYS OF THE SEA FISH.

Editor Forest and Stream:

In your issue of Jan. 20, Mr. S. C. Clarke, of Georgia, has his say in regard to the New England fisheries, charging the menhaden fishermen with destroying their food, etc. The mistake Mr. Clarke makes, and all others that have not made a study of the fishery question, is in attributing scarcity of fish to man, which theory has been exploded by Huxley, Baird, Buffon, Goode and other scientific and disinterested authorities time and again. To rescue Mr. Clarke from the quagmire in which he is floundering, we will cite for his benefit a few facts from the many in our possession.

Sea bass were plenty on this coast thirty years ago; thousands of barrels were taken in the Scoconnet traps and sold for manure. Soon after they left and were gone twenty-five years. They made their appearance in 1882, and have been as plenty as of old ever since.

Codfish have been selling from vessels in New York city this winter for less than one cent per pound. Within the last ten years codfish and mackerel have been very plenty in Cape Cod Bay, and it is a safe prophecy to make that they will be plenty again within the next ten years. Since 1880 mackerel have been so plenty it hardly paid to catch them. A false prophet (Rice by name) delivered a lecture before a learned body in Boston during 1878 or '79, stating that mackerel were gone never to return, unless taking them in purse seines was prohibited.

Sheepshead many years ago were plenty in Narragansett Bay, but not one has been seen here during this generation. Scup made their appearance in 1800, were mostly gone during 1870, were plenty as ever before known in 1874, and have been plenty and scarce twice since that date. Squiteague used to be plenty in Narragansett Bay, left and were gone about thirty years; came back during 1870 in unheard of quantities, and since the latter date have been off and on once or twice. Tautog were mostly frozen during 1856; it was hard to find a specimen the following summer, but in five years they were as plenty as ever; were again frozen during 1875 and were plenty again during 1880; have since disappeared, and small tautog which will be a large crop during 1889, made their appearance last spring.

The last strange phase in the fish supply is the appearance of young sea herrings in immense quantities between Cape Cod and Delaware Bay. The farmers of Rhode Island hauled hundreds of barrels of them ashore in mosquito netting last fall, and used them for manure. Another stranger is the butter-fish, which seem destined to crowd out the scup, for the off-shore waters between the Delaware and Cape Cod seem to be full of them. D. T. Church.

Tiverton, Rhode Island, Jan. 24.

CHATEAUGAY AND PLUMADOR.

THE heat of July was an excuse, but a longing which is born, not bred, in every sportsman, for that state of primitive life was the true reason for my trip to the home of the trout.

Those who have read that delightful letter of "B." in Forest and Stream of Nov. 19, 1885, will need no description of the route, the beautiful lake, nor of Dick Shults, the unique acanthopterygian who keeps at Indian Point. That is rather a long word, but it is so expressive. As his hotel is 1,600ft. above the level of the sea, words which contain much gas are apt to expand. Dick's house is not grand, but is an excellent place for those who are willing to leave behind them the dust of the city to breathe the balmy odor of the great woods. The table fare is excellent. This is not an advertisement, but a slight acknowledgment of favors which are alike to all.

After dinner on the day of our arrival, we repaired to the piazza to talk over plans for the campaign, and here, sad to relate, I received the startling information that had I come the week before or could I wait until the middle of August, fishing would have been or would be better. Brother fishermen, we get toughened to such news, but for all that, bear me witness that it does hurt. We build great expectations, cover them with tinsel and get on our knees to worship them. Then some unfeeling noodle pricks them with a needle of experience and the collapse is so sad. My visions of trout like a shark dwindled into trout like a minnow, and sadly I selected my smallest flies and weakest leader as most fit to allure the pigmies I had journeyed 200 miles to conquer.

Everything being ready Dick rowed me to the mouth of Rocky Brook, and talked incessantly, stopping at intervals to take breath and set the spring for another tune. "Now," said he, "cast over there in the channel," which I proceeded to do again and again with gradually lengthening line, when with startling suddenness something seized the fly. A minnow, eh? I've struck a splended trout and my rod is bowing gracfully in acknowledgment of his backwoods salute. Back and forth he flashed rather than moved, when of a sudden the strain ceased and my flies came viciously back in my face. Dick looked at me for a moment and I could detect the symptoms of a brutal sneer; then he quietly said, "Mr. S. that was a lunker." The floodgates were open, and while he talked I silently untied the forty-eleven double bow knots which had somehow been tied in my leader, and resumed casting. Success was fair, though no more monsters disturbed our equilibrium. Trout of 4 to 6oz. were caught, until a sudden dash of rain told us to quit. It rains wonderfully easily at Chateaugay; no clouds are needed; a little fog peers over the mountains and then it rains. We reached the landing well satisfied. Our catch was cooked and we sat down to a nicely prepared supper.

The next morning (Sunday) dawned bright though breezy, and from the front piazza I viewed a prospect which is worth a journey in itself. The Ellenbury range to the north, Lyon Mountain to the east, W Mountain to the south and numerous other peaks fitly frame the lake, an ever-changing picture of which none can ever tire. Glorious Adirondacks. God made you beautiful, but man is trying hard to despoil your beauty with railroads and the smoke of charcoal kilns. The beautiful and the practical are here not wisely betrothed; unless New York forbids the banns, soon there will be no place within her borders where one can say "Behold what the Lord hath wrought." The Iron Company is building a railroad through to Paul Smith's; and between the locomotive and the dogs, the deer now so plenty will ere long live only in the traditions of the guide.

Monday morning Dick brought forward my guide to be, and introduced him as George Cook, adding in that truly modest way so characteristic of other great men, that George, as a guide and fisherman, was second only to R. M. Shults. Cook was a spare man of moderate stature. My experience with him afterward proved that in his specialty he has few equals. In one thing his superiority is so great that none can question, that is in catching chubs. He can catch them when other men have to content themselves with trout, and he has the good sense not to chuckle over it either. His other virtues are taciturnity (at intervals).

Several days passed pleasantly. Rocky Brook, West Inlet, Cold Brook and South Inlet yielded good though varying sport, and many warrior of the spring holes gave his life—a victim to the Canada, Montreal or Jenny-Lind. When the "conditions" are right, plenty of good fish may be taken from Chateaugay by one who knows how to cast a fly. There is fly-casting and fly-casting. The difference is as great as between the music of a Cremona in the hands of an Ole Bull and that of its namesake on the back door yard fence.

One afternoon we started for Plumador. George had for several days been dropping into poetry, and something had to be done, especially as the stanzas were set to music. I knew that if he was allowed to drop into poetry he would be apt, like Mr. Wegg, to get above his business, so we started. Up South Inlet we paddled, through and under the alders which arched the narrow stream so close to the water that it was only with much difficulty that we could force our way. After traversing what seemed about fifteen miles of winding stream I asked how much further it was to where we were to spend the night. "Only about a mile further," said George. I picked a dry stub out of my ear, rubbed my nose just then slapped forcibly by an overhanging branch, and pushed on, thinking how true it was that the longest road has finally an end. Another thought struck me and I asked how far we had come. "About two miles," he answered. "Only two miles?" I exclaimed, "is it any better the rest of the way?" "Worse," said he; and he told the truth, as he always does.

About sunset we arrived at the Springs, and after mooring the boat George took the pack and led the way to a little log cabin fifty rods from the stream. This was his base of supplies and starting point for fall deer hunts. After supper he told story after story of great success, sore privations and hair-breadth escapes. Finally I asked whether there were any panthers there. Some, he said, and then went on to tell how about a year or so ago while sleeping in this very cabin one came on the roof and how he expected every moment that it would break through the frail bark. I asked no more questions but laid down and tried to sleep, which thanks to fatigue I did quickly, in spite of nervousness. Suddenly a tremendous clawing on the roof awoke me. Mercy on us, thought I, the panther has come for us now, sure. George was sitting beside me scratching matches, which somehow failed to ignite. "Strike a light," said he, "and we will get him." "Get him!" I murmured, "I only hope he won't get us." Meanwhile the clawing approached the door which, in the pitchy darkness, I could hear creaking as it slowly opened. Just then the lamp was lighted, revealing not a panther but a large porcupine hanging by the doorpost. He dropped down and got away into the bushes, not, however, without a stroke from a piece of rotten stump, which we found in the morning filled with quills. The following day I cautioned George about walking too fast through the woods, as I had a sore knee and did not wish to strain it. So he promised to go very slowly, and as it was only six miles, with moderate exertion we would get into camp by noon and I could rest half the time. The direction, as he said, was due west and almost as direct as the crow flies. Never has my faith so cruelly suffered. When we started out we went nearly due east, and when I asked the reason George said it was always necessary in the wood in order to get a good start and acquire momentum. We finally reached Plumador at one o'clock, six miles in seven hours, but I firmly resolved never to go there again on the air line route.

Plumador is a beautiful lake or pond, about a fourth of a mile in diameter and nearly round, quite shallow and fringed with rushes, excepting the eastern shore, which is rocky. It is framed in by the grand primeval forest, and abounds with excellent trout. A recent storm had stirred it, so that it was far from clear; but so calm it lay and still that one could hardly think that its bosom had ever been rippled by the paddle or that its shores had echoed to the crack of the rifle. On the opposite shore was the bark shanty on a gentle slope, seeming to invite us to rest from that dreadful six-mile walk. But the pond must first be crossed, so I stretched myself on the mossy bank while George went to get his boat, which was safely hidden from stray seekers. He was gone so long that I sank into a quiet doze. Thought was busy, and the witchery of Cooper's Mohican came over me. Nucas was outlying on the track of the Mingo. The caw of the slow-flying crow was the signal of Hawkeye, and I seemed to hear the splash of the beaver startled by the singer's silent figure. George was returning, and the splash of his oars completed the spell and awoke me at once. Yet the dream did not instantly vanish. Perhaps on this very spot the beautiful sisters had rested on their long weary ride, while their dusky captors caught fish for their evening repast. Could these silent shores tell the story of things they have seen during the ages, what a tale would they unfold. Tribe has succeeded tribe, and all have passed away, but the beautiful lake remains. She spreads her sparkling circle still unchanged. The trees look old with long sprays of moss hanging from their boughs like hoary beards. The lake smiles youthfully in the sun. Men act their part, grow old and moulder away. Lakes and rivers never grow old.

We soon crossed to the other shore and gladly reached the hut, which was a rude shed of bark, the back closed by boughs piled loosely, the front open. This gave excellent ventilation, especially when the wind blew strong. One great charm of the Adirondacks is the air; there is always plenty of it and some to spare. George then built an excellent bed of balsam boughs. It was very soft and balmy, but I found myself on the bare ground in the morning, while George was cozily curled up in the middle of it. When we awoke in the new day all was still. A duck quacked in the rushes; birds piped in the treetops a homesick-looking chipmunk perched himself on a neighboring stump and eyed us with mild curiosity.

The lake invited us; and breakfast finished, we sought the most attractive looking spots, but cast I ever so deftly, not a rise could be had. Flies were changed without success and we finally made up our minds that the trout must have gone visiting. We went back to camp and spent the remainder of the day in loafing.

The next morning a gentle breeze was ruffling the water and playing tunes in the trees while we were breakfasting on the remains of canned beef, dry bread and no fish. On calling George's attention to the latter fact he promised that it should not occur again, if he had to come down to worms for bait; but as the camp needed some repairs he thought best to "fix up" before trying the lake. Everything finally being to his mind we sallied forth a little before noon, a nice breeze from the west making the lake dance and sparkle, while great masses of cloud caused shadow to chase sunshine over the water and changed the forest alternately from muddy brown to vivid green.

George had declared that we should have some trout; and we did. Near the inlet is a large patch of water lilies, covering perhaps half an acre, in water 6ft. deep. My first cast raised a fine fellow, which I failed to hook. At a second attempt he met his fate. This was the beginning of fun. The water seemed almost to boil wherever my flies touched the surface. Few of the trout hooked weighed less than half a pound. Several times two were taken at a cast, weighing over a pound each. As I did not wish to overdo it, I soon ceased casting excepting when a promising wake gave token of a larger trout than the average. This was a success and I had several royal battles with beauties, some of which drew the spring of my pocket scales down to the 2lb. notch. But more days were to come, and as we had all that could be cared for, and more than could possibly be eaten, I reluctantly told George to row to camp. He did so, grumbling, however, at the "pusillanimous foolishness," as he called it, when jerked trout was almost equal to herring.

For dinner I ordered boiled trout to his utter astonishment. "Why!" he said, "they are not fit to eat; you mean broiled." "No," I said, "put a good-sized piece of butter in the water and don't let them boil to pieces." My recipe as to the butter is modeled after my mother's recipe for mince pies. "Put in all the spices you dare to, then shut both eyes and throw in another handful." Butter is generally so scarce in the woods that there is seldom danger of overdoing this, and trout so cooked are to my taste most delicious.

This was one of several days of unmixed pleasure. We had found the home of the trout, and when conditions of wind and water were right the sport did not fail us. One day, casting near a bunch of lily-pads, I allowed my fly to sink somewhat deeply, and giving a gentle twitch, was about to recover, when with a mighty swirl my leader was taken off as though cut with scissors. Quickly rigging another I tried vainly to raise him again. He was thirty feet long and weighed a ton. If you doubt it, ask George.

The days passed quickly; and one morning I stepped into the boat for a final fish. After two hours of sport we returned with twenty-six splendid trout, which weighed, as taken from the water, a few notches over twenty pounds. These were cleaned and packed carefully in cool moss for carrying out. Camp was broken up, the lake crossed, the boat carefully concealed as before, and soon the forest veiled dear delightful Plumador from our view.

And so are hidden from the present our joys of the past. Some day we part the shrubbery on the top of the "divide" and fix our gaze on the gone before. While writing I have been sorely tempted to change the past to the present tense, so fresh and vivid all its scenes have been. I hear the night wind sighing in the trees, the owl hooting dismally from the swamp, the crackling of the camp-fire as a sudden gust catches and tosses the flame. I watch from my balsam bed the gray glory of the coming dawn, until the uprisen sun first whitens then chases away the smoke-like fog hanging so closely to the slumbering lake. I breathe the odor of the woods. Then the fury of a winter storm raging without tells me that months have passed and months must come before my wrist will feel again the spring of the pliant rod, or my ear hear the swish of the flying line and the splash of the eager trout. Truly 'tis not all of fishing to fish.

H. E. S.

SYRACUSE, N. Y.

MOOSEHEAD LAKE TROUT.—*Editor Forest and Stream:* Those petitioners who have asked the Maine Legislature to extend the close time on trout and landlocked salmon in Moosehead Lake to May 15, or up to June 1, as their petition at first read, are understood to have been given leave to withdraw by the Committee on Fisheries and Game. The story is that a body of sportsmen, together with some of those interested in the hotels and steamers on Moosehead Lake, were desirous of preventing the taking of the usual large quantities of trout in the early spring by bait-fishing, and that they resolved to petition the Legislature to make the close season longer for that purpose. The petition was signed by a number of prominent fly-fishermen from both New York and Boston, and set forth the damage to the trout from the practice of this early bait-fishing. The measure was opposed by several prominent sportsmen, who like to go to the lakes early, among them the Hon. Hannibal Hamlin. It seems that the force was too great against the measure. Even the Commissioners are understood not to have favored the measure, though they of course believe in giving the trout all the protection possible. But from a matter of principle they are against special legislation for localities, not only because more difficult to enforce, but because of the injustice to those who wish to indulge in bait-fishing.—SPECIAL.

THE FOREST AND STREAM has been complimented by having a new brand of cigars named after it by the well-known manufacturers Messrs. Wm. Eggert & Co., of Pearl street, this city. The familiar vignette of the paper ornaments the cover of the box, and the manufacturers say that they have made the brand worthy of its name.

SUBSCRIBERS who may chance to receive mutilated or defective copies will confer a favor by returning them to this office, and others will be supplied in exchange.

A PAIR OF WADING TROUSERS.

ABOUT Christmas time the expressman left a package for me which contained a pair of wading trousers with boot attachment. There was no card, nor even an express mark on the package to denote who had been so kind as to send them. Coming well under the armpits of a rather short man, they must give him the appearance of Adonis and add a charm to the landscape wherever he may be. The boots fit well and should the wearer slip on a mossy stone and then conclude to lie on his back in the stream and cool off for a while, there is room for several gallons of water and a half bushel of chubs in the legs. All efforts to locate the unknown sender of the trousers have failed. I wish, however, to thank him for his kind remembrance, and to send him the first trout caught while wearing them. Can it be that at some time I have said that rheumatism had of late followed wading, and its horrid spectre appeared to view at every opening in the bushes and that the dancing shadows on the trout pools often suggested the shooting pangs which come later? If so some friend has sent this present as a solution of the difficulty, perhaps to wean me from a later fondness for boat fishing on lakes and to try and bring about a reconciliation for an earlier love. As ordinary rubber boots are a delusion and a snare to the wader, keeping the promise of dry feet to his eye but breaking it to his hope, there is no compromise between low shoes, which let the water in and out, and wading trousers which keep it out. After thanking the unknown donor and admiring the present for a while, I sat down at the desk to try how they would fit on the bank of a stream. The following soliloquy was found on the table next morning:

To wade, or not to wade, that is the question:
Whether it is better in the legs to suffer
The slings and arrows of rheumatic torture,
Or wear rubber trousers in the cold wave's wetness,
And by protection end them? To wear, to sweat,
No more; and by wearing to say we end
Sciatica, and the rheumatic stings
That flesh is heir to—'tis a consummation
Devoutly to be wished. To wade, to slip;
To slip, perchance to fall; aye, there's the rub;
For in that slip on back what waves may come,
When we have slid from off a mossy stone,
And fill our trousers to the very neck,
Must give no pause; there's still the boat
That bears us dryly on the wood-bound lake:
For who would bear the pinchings of neuralgia,
The doctor's visit, the hypodermic syringe,
The drowsy opiates and the nurse's poultice,
When he himself could all these ills avoid
By use of boat? Who would heavy trousers wear,
To slip and sweat under a weary load;
But that the dread of something after damp;
The dancing imps along sciatic nerve,
The fiendish tortures, whose most dread return
No angler e'er desires, puzzles the will:
And makes us rather bear the ills we have,
Than fly to others that we know not of?

F. M.

IMPROVED CARE OF ANIMALS.—Every thoughtful observer must have marked how in late years the devices for the comfort of our dumb servants have improved. Better cars for their transportation, better yards for their keeping, better stables, stalls and feed for their comforts. People find that it pays to keep good stock and to keep them well. Interest and humanity both demand good keeping. This extends to their care in sickness as well as in health, and this improvement reaches further than is generally supposed. Strolling into an extensive establishment where some of the best stock in the country is kept, a fine animal was brought from his stall evidently suffering from severe colic. He could not stand a moment, scringing with pain, pawing and could be hardly kept on his feet. The foreman, eyeing him for a moment, stepped to a little case, opened it, took a small bottle, and with a little bent glass tube ejected a few drops upon the tongue. The horse was soon easier, and after a second dose in half an hour began nibbling his hay. "That's the way we do it," said the foreman; "no hottling, no balling, no bleeding or blistering for any disease, only Humphreys' Veterinary Specifics. They cure every time. We have not for years used any other medicines, and don't lose any stock from sickness." They are being used everywhere.—*Adv.*

THE MAINE COMMISSION.

FROM the report of the Commissioners of Fish and Game of the State of Maine, for 1886, we have already quoted the interesting article on lobster protection in our issue of Jan. 20, and in the next issue we gave an extract concerning the alewife. The report opens by saying that the two years that have passed since the last session of the Legislature have severely tested the new fish and game laws then enacted, while the increased pecuniary benefit has evidenced the wisdom and foresight of the lawmakers, and then follow some extracts from FOREST AND STREAM and other papers which are inserted to show the approval of the laws by persons outside the State.

Of all the rivers of the Atlantic slope of the United States the Penobscot is the only one which furnishes salmon eggs in sufficient quantity to provide them for stocking other rivers, and had it not been for the work of the State and the United States fish commissions there would be few or no salmon left in the river to-day. The increased population and facilities for transportation, together with the obstruction of the water courses by mills, and all those other encroachments of civilization, including the rapacity of the fishermen, would have thinned the annual runs of salmon to a few stray fish, had not propagation come to the rescue. The Commissioners say:

"No salmon ever ascends above the tide-water dam at Bangor that is not a breeder seeking its spawning ground. These fish should be protected. To be angled for with hook and bait or flies is all the license that should be permitted. But the law has been openly set at defiance. Parties from Massachusetts have been induced by the avarice of persons on the east branch of the Penobscot to participate in the felonious sport of netting our brood fish. Not only have the fish been netted, but dynamite has been and is used as an effective means of fishing by the local poachers. Application was made to the last Legislature to again legalize netting two days in the week on the east branch. The question was asked in response: 'Would they guarantee to enforce the law if granted?' The answer was: 'No.' The Penobscot can be made self-sustaining if the State will provide money to protect the salmon from destruction when above tide-water. If not, then provision must be made for 1,000,000 of salmon fry to be turned into the river and tributaries annually. By adopting one or the other of these two methods alone, can the salmon in the Penobscot be preserved from utter extermination. The benefit to the inhabitants of upper Penobscot from visiting sportsmen to fly-fish for salmon, would far exceed in value all the salmon captured by net, spear and dynamite, while an equal opportunity is open to them to fish by legal methods with their visitors. The testimony of many men can be adduced in Bangor and Calais, who never dreamed of the possibility of taking a salmon with what was termed a fish pole, who are now converts to the rod and fly, and fierce opponents to any other methods above tide water, such is their enthusiasm for the newly-experienced delight of killing a salmon in a fair struggle of skill. Salmon do not spawn oftener than once in two years, a portion ascending the rivers each year. Since the enforcement of the law forbidding netting near the dams on the Penobscot and St. Croix rivers, the salmon collect at every tide in considerable numbers, undergoing a sort of preparatory acclimation before making a lengthened journey to their spawning grounds in the fresh water, thus affording excellent sport to the angler. Both the St. Croix and the Penobscot, if proper means of protection are furnished, will yield an increased revenue to the State from the advent of anglers to enjoy this noble sport, which with us is free to all."

Salmon planting in the Saco has been a success. The first plant was made in New Hampshire in 1879, and this has been followed at other points on the river, and in 1886 "salmon of large size have appeared in considerable numbers at the mills at Saco, and at the dam at Bar Mills, where a fishway is urgently called for by the local inhabitants." In 1886 there were planted 1,200,000 salmon fry in the waters of Maine. Of this stock Prof. Baird contributed 500,000. The distribution was: 700,000 to the Penobscot, 200,000 to the St. Croix, 100,000 to the Saco, and 200,000 to the Kennebec. Of those contributed to the St. Croix, Mr. Frank Todd, of St. Stephen, has always paid for the hatching and distribution. The salmon works at Orland purchase the fish from the nets at market rates, and after stripping them of their eggs the parent fish are returned to the waters, a system of great benefit to the river.

The landlocked salmon has not been found in Maine waters unaccompanied by the smelt, which seems to be their favorite food. The smelt spawns in the spring and its young are hatched about the time the young salmon begin to feed. The Commissioners have never known the landlocked salmon a marked success in any waters, unless there was a plentiful supply of dwarf spring-spawning fishes. "If there have been marked failures they have arisen from an insufficient supply of food adapted to the new-born fish. In Rangeley Lakes there are red fins, blacked-nosed dace, and doubtless other dwarf fishes. The landlocked salmon is a success in Rangeley, as is evidenced by a fine show of salmon at the spawning grounds near the village. Many landlocked salmon fry have been planted at Moosehead; the dwarf fishes are doubtless to be found there, but in both cases, at Rangeley and at Moosehead, we shall never be entirely satisfied with the plant until a strong colony of smelts is introduced into both waters. A foolish notion is widely entertained that a surplusage of fish food (or minnow food, perhaps, will be better understood) will injure the fly-fishing. Just the contrary is the fact. Trout and salmon will rise to the fly even with minnows in their mouths. Webb's Pond, in the town of Weld, is noted for its fine pickerel and trout. The tributary inlets of the ponds are large and of swift running water over a gravelly and rocky bottom, affording abundant protection to the trout from the vile pickerel. The pond is full of smelts, indigenous to the locality. Ten years since we commenced stocking this pond with landlocked salmon. Some few of the fry we introduced were from Sebago salmon eggs, but the main supply was from Grand Lake Stream. The increase of these fish in their new locality is truly wonderful, many of all sizes from 1 to 8lbs. being yearly taken on both fly and bait. In the spring of the present year, a spent male salmon was taken, that weighed 11lbs. 2oz. This fish in full condition must have weighed 15 or 16lbs., probably more. On a recent visit of the Commissioners to the pretty little village of Weld, they found the people quite elated over their great run of salmon on the spawning grounds."

Sebago Lake has been a great source of expense and trouble. It required more money for wardens to protect it than the Commissioners had. Their only resource to save the few salmon left in Sebago waters has been to build a weir, stopping every fish as near the mouth of the river as possible, to take the spawn of every ascending salmon and hatch the product at a house built at a convenient point for the purpose, all to be turned back into Sebago waters. Sebago may thus be made one of the most popular fishing resorts in the country, and of inestimable value to Portland and all the railroads centering there. The demand for landlocked salmon fry has been far in excess of the supply or its possibilities. The device contrived to check poaching on Crooked River was a fence weir built directly across the river near its mouth, with a plank walk on top, to enable a man with a rake to clear away any refuse collecting between the rails of the fence, endangering the safety of the structure from any suddenly occurring autumn freshet. From time immemorial the spearing of these fish has been the only method of taking them by the local inhabitants, and is continued down to the present day, until the fish have become nearly extinct. Weir has been amply sufficient to take and hold all the ascending fish. If the lake could now number one salmon to an acre of water, the Commissioners should have required weirs capable of holding as many hundreds as they have now units.

It seems that as many landlocked salmon can be bought at the rivers as there are funds to pay for, while at Grand Lake Stream the waters are limited and the crop of parent fish is proportionate. A new field has been opened at Crooked River, Sebago Lake, the large size of the fish taken there yielding many hundreds of eggs per fish more than those at Grand Lake Stream, one female taken there weighed 25lbs., and an increase in the future supply is looked for.

THE INDIANA COMMISSION.

IN his report, recently issued, Mr. Enos B. Reed, Fish Commissioner of Indiana, says: While on the subject of carp, permit me to say that since testing them as a food fish I have quite changed my mind regarding them. From my own experience, and the experience of others related to me, I am led to believe that the carp is about as edible a fish as swims, when it has been properly raised and properly prepared for the table. No fish taken from a pond all mud would be palatable, and the misfortune is that carp ponds are not properly built or supplied with sufficiently pure water. If it should be asked, could not other fish be as profitably raised as carp? I would answer no, for the reason other fish cannot be so easily propagated, and there is none save the pike that grow so rapidly. When a 3in. carp in one year will reach to a growth of from 12 to 14in. and be fit for table use, the wonder is not that there is such a demand for carp, but why there is not a carp pond on every farm in the State. Each year adds to their growth until they reach the weight of good-sized shoats, and are fully as palatable. It has been said, by those who profess to know, that carp will eat whatever a hog will. Certain it is that they will eat almost anything.

In my opinion there are no fish that could be introduced into our rivers, creeks and lakes of a superior quality than those, I might say, "native and to the manor born." We have four or five different varieties of fish of as excellent a flavor as can be produced anywhere. I might name the small and large mouth black bass—as gamy as any fish of their size that swim, reaching to the weight of four, five and six pounds—the goggle or red eye—in some localities called rock bass, a most juicy and toothsome fish and long lived withal. The crappie or bachelor, or Campbellite—a delicate fish, and none sweeter if eaten on the same day that it is taken. Then there are small perch and sunfish and the dace, which latter, though small, are equal to any trout that ever were caught. The lake perch—raccoon or striped—which are so abundant, is a most solid fish, the roe of which—and almost every raccoon perch seems to have a roe—is like the pie of four-and-twenty blackbirds, "fit to set before a king"—and we are all kings in this country. I do not mention the mud and channel cat, which some fishermen affect to despise, while the latter is as rich as a whitefish.

All these fish are plentiful—or would be if left alone—in the river, creek and lake from one portion of the State to the other—but the misfortune is they are not let alone, but are subject to the vandals of the seine and dynamite, who have been accustomed to laugh at the laws made for the protection of the finny tribe.

If I was asked to say in one word what was needed in order to make fish more plentiful in our streams, I would say, "Protection! Protection! Protection!" Let this be provided and Indiana needs precious little else. But how can we have fish in plenty when in some of the counties a Grand Jury does not indict those who are known to seine and dynamite and the prosecuting attorney is afraid to prosecute?

There is not a lake or a stream in the State which, if protected from the seiners and dynamiters for from two to four years, would not be full of edible fish that would seek the bait and ask to be "taken in out of the wet." Then might the fly-fisherman or the live-bait angler ply the gentle art with success and to his heart's content.

FISHING ON A FOGGY MORNING.—Casting a meditative glance toward where the sun had gone down, the old rounder began: "Well, gentlemen, I had a little experience of my own once. I went down the Chattahoochee River, in Decatur county, to visit an old friend. He had often told me of the splendid fishing there, and I was anxious to try it. It was late in the evening when I got there, and I retired early so as to be ready for the fun next day. I asked how far it was to the creek, and they told me it was only a few hundred yards just beyond the fence. By light next morning I was up and secured a good tackle and a few sawyers. I started off toward the creek. The fog was so heavy, for it was woods' burning time, that I could not see any distance, so I groped my way as best I could across the little clearing. Reaching the fence I climbed over, and picking my way carefully, for I did not want to fall into the creek, I proceeded slowly down the slope until I thought I must be near the water's edge. Baiting my hook I threw it forward, and just about time enough for it to strike the water I felt a pull, and with a jerk I brought in a fine fellow. For ten minutes I stood there and pulled them in, and then, fearing that I would spoil one day's sport, I regretfully retired, and by accident I reached the house through the fog. After breakfast the fog lifted and we got ready for a day's enjoyment. You may imagine my surprise when on going to the place where I had caught so many early in the morning, I found it was a full 100yds. from the bank of the creek. The truth is, I had not touched the water, but just stood there and caught them out of the fog.—*Atlanta Constitution.*

AN ATTEMPT TO KEEP TERRAPIN.—Mr. Edward H. Strong was in Chestertown recently, and gave some interesting information about the diamond-back terrapin. Mr. Strong is a farmer, but, living near the water, and being fond of all the sports which it affords, spends a great deal of his time in his famous canoe, the Mayflower. He states that terrapin are easy to catch in the spring, but the trouble has always been how to keep them until winter, the time at which they are in demand. If you confine them in a pond of water they will become very poor and very often die; if kept in the air they are sure to die. The high price they bring in the city during the winter is the result of the difficulty experienced in preserving them from the spring until the winter. It is nothing unusual for fine diamond-back terrapins to bring from $50 to $75 per dozen in Baltimore or New York city during the Christmas season. Last spring Mr. Strong caught a great many, and resolved to try several experiments in order to see whether or not he could find a successful plan of keeping them. About the 1st of June he placed seven in an iron box and hermetically sealed it; he put nine in a wooden box that was not air-tight, and then took twenty-six or twenty-seven and buried them in the earth about 18in. deep. A few days ago he determined to examine the terrapins. All of those he had put in the iron and wooden boxes were dead, while all those he had buried were alive, fatter and in better condition to eat than when they were buried last June.—*Baltimore Sun, Dec. 5.*

The Kennel.

FIXTURES.

DOG SHOWS.

Feb. 8 to 11.—Southern Massachusetts Poultry Association Dog Show. Fall River. A. R. G. Mosher, Secretary.

March 8 to 11.—Second Annual Dog Show at Buffalo, N. Y. J. Otis Fellows, Secretary, Hornellsville, N. Y.

March 22 to 25, 1887.—Spring Show of the New Jersey Kennel Club, Newark, N. J. A. C. Wilmerding, Secretary, Bergen Point, N. J.

March 29 to April 1, 1887.—Inaugural Dog Show of Rhode Island Kennel Club, Providence, R. I. N. Seabury, Secretary, Box 1333, Providence.

April 5 to 8, 1887.—Third Annual Show of New England Kennel Club, Boston. F. L. Weston, Secretary, Hotel Boylston, Boston, Mass.

April 12 to 15, 1887.—Thirteenth Annual Dog Show of the Western Pennsylvania Poultry Society, at Pittsburgh, Pa. C. B. Elben, Secretary.

May 3 to 6, 1887.—Eleventh Annual Show of the Westminster Kennel Club, Madison Square Garden, New York. James Mortimer, Superintendent.

FIELD TRIALS.

Feb. 15, 1887.—Inaugural Trials of Tennessee Sportsmen's Association. Entries close Jan. 10. R. M. Dudley, Secretary, No. 84 Broad street, Nashville, Tenn.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **4606.**

THE BEN HILL—LILLIAN HEAT.

Editor Forest and Stream:

Careful investigation of this National field trials business has forced me to the conclusion that FOREST AND STREAM has not demonstrated its usual clear-sightedness in dealing with one of the offenders.

Your able and fearless report of the disgraceful proceedings was nothing more than one expects from a paper which occupies the proud position of indisputable pre-eminence in matters canine. It is not over that report we differ, nor yet over your lucid and forceful editorial, furnished at a time when at least one of your contemporaries was dodging about in search of its overcoat. But I do think, as do others with whom I have conversed on the subject, that certain parts of your footnote to Mr. Bryson's letter, as well as subsequent requests for information, lack the generosity of feeling usually employed by you when seeking or distributing knowledge.

We have recently been informed that Mr. Bryson is an "honorable gentleman," and he probably feels aggrieved and discouraged by the course you have pursued in trying to force from him facts which, if made public, might lead to the punishment of the givers of "something valuable" as well as the receivers.

Mr. Bryson has done more than any other man for field trials in this country; he is a practical man, and he knows more about the vulpine doings of certain persons than any other being, excepting, perhaps, the Chicago leader and editor. Tired of having to shoulder the responsibility and disgrace which association with these people naturally involves, Mr. Bryson's conscience yields at last to the ever increasing pressure put on it, and he comes forward and frankly tells what has been done in the past, and what may be done again in the future. The boodle alderman who turns State's evidence earns immunity and saves his bacon; and yet you insist that this "honorable gentleman," after having disclosed facts such as have never been divulged by any other person, is doing wrong just because he doesn't find it convenient (I think that is the proper word to use) to let you have the last link in the chain of evidence—the link that might bind the future and the past by an inseparable, if not uncomfortable, bond.

I feel confident that FOREST AND STREAM, after having given more careful consideration to some of the facts in this case, will become a generous advocate of pardon for Mr. Bryson, and will exonerate me of any intention of attempting a defense of an unworthy subject. Mr. Bryson writes: "Lillian will beat him (Ben Hill) ninety-nine times in every hundred," and, "I contend the circumstances which caused Mr. Stephenson to have Ben Hill pulled was a greater wrong than the pulling." Here is a straightforward and manly acknowledgment of things which have hitherto been held sacred by certain parties. Mr. Bryson, a successful competitor at National trials, knows that dogs which cannot fairly win more than "one heat in a hundred" have by some mysterious (to us) process been transformed into winners, and he and his friend, Mr. Stephenson, in order to avert a ninety-nine-to-one-chance victory in the Ben Hill—Lillian heat, ordered Mr. Bevan to pull Ben Hill. Messrs. Bryson and Stephenson having a big "say" in the appointment of the judges at these trials, should know when it is necessary to make sure doubly sure. Don't you see? Remember, please, that I know nothing of the judges at these trials, and don't wish to. My defense of Mr. Bryson is based solely on evidence supplied by prominent members of the club.

If ninety-nine-to-one-chance dogs had not been successful at previous trials Messrs. Stephenson and Bryson would not have had reason to fear Lillian's defeat. Ben Hill would not have been pulled and the dog-loving community would have been spared disgraceful exposures. Undoubtedly, as Mr. Bryson states, "the circumstances which caused Mr. Stephenson to have Ben Hill pulled was a greater wrong than the pulling." Thanks to Mr. Bryson, all this is perfectly clear.

Now sir, perhaps you can tell us where to find full recorded particulars of these ninety-nine-to-one-chance victories. I have not examined the back numbers of your esteemed contemporaries, the *Turf, Field and Farm* and *Breeder and Sportsman*, but of the other old established papers devoting a column a week or more to dog matters, only one (FOREST AND STREAM) has a record for having exposed trickery and fraud at field trials. The evidence supporting this statement is voluminous and conclusive.

Do you, sir, suppose that Mr. Bryson is ignorant of these facts? There is not a grain of evidence to show why he should be. By your courtesy I will continue my queries and ask, have you forgotten that within the last few years certain snipe-nosed, dish-faced, light-eyed, prick-eared, tucked-up, small-boned, ring-tailed, leggy rabbit-coursing dogs have been entered for competition at our shows, and under ninety-nine-to-one-chance judgments have been juggled to the front when competing against English setters? How these worthless looking brutes were written up by a certain paper, their defects magnified into sterling qualities, and the judges who placed them complimented for their sound judgment, must be fresh in your memory. FOREST AND STREAM and *Sporting Life* effectually put a stop to that business; but how about the other papers?

When and where did they ever give particulars of this unsavory business? These facts, the astounding ones disclosed by Mr. Bryson's letter, and perhaps many others of the same color, are in Mr. Bryson's possession; his insinuations are founded thereon. Certain papers failed to report crooked work of which Mr. Bryson was an eye-witness. The reporters were either blind, or incapable, or they were silenced by some means. No newspaper would send a blind reporter to a field trial or to a dog show, and at least one of our papers which has always withheld information that was not complimentary to a certain clique, has frequently advertised its reporters as practical men. To what, then, does all this point? It seems to me that Mr. Bryson instead of insinuating should have affirmed. His reasons for not having done so are best known to himself and the delinquent reporters. Mr. Bryson has told so much that it is only fair to suppose he would tell the balance could he do so without personal inconvenience. His conduct is most commendable inasmuch as he has clearly shown that ninety-nine-to-one-chance dogs, when owned by the right parties, do scoop in the boodle at certain trials; and that a dog may be ninety-nine-times better than an opponent and yet not be able to win unless the heat is made absolutely airtight by fixing the handler of the ninety-nine-to-one-chance dog; and that at least one reporter has been "sweetened." Truly "the circumstances which caused Mr. Stephenson to have Ben Hill pulled was a greater wrong than the pulling." Mr. Bryson has told his share; let some other penitent supply the missing link. It's the "circumstances" you want to be after. CHAS. H. MASON.

NEW ROCHELLE, Jan. 29.

Editor Forest and Stream:

I have never attended a field trial, but have read your reports with a great deal of interest. The Ben Hill—Lillian affair appears to me to have been an outrage and I sincerely hope that the National Association will deal with the perpetrator of it in a manner that will prevent such occurrences in the future. Mr. Bryson's letter in your issue of Jan. 20 leads me to believe the matter to be worse than your report of it makes out. We are given to understand that Ben Hill is a very ordinary dog, yet his owner found it necessary to "pull" him in order that he might not beat Lillian. Is it possible that the field trial merit of Lillian that we have heard so much about has all been earned under similar conditions? If so a very great wrong has been committed, as it is well known that it takes a lot of money to purchase a dog of the breeding she represents, and a portion at least of the value is supposed to be represented by actual field merit proven by honorable competition in public. Is it possible that other records have been obtained in like manner? Mr. Bryson's insinuation about "pay-me handsomely" reporters leads me to believe that there are strong grounds for suspicion in the case and that he may know something of the matter. I therefore second your demand that he make a clean breast of it and give us all the facts in order that we may know just where we stand, and so far as possible make a revision of the records. ALTOO.

BROOKLYN, Jan. 26.

Editor Forest and Stream:

You are quite Puritanic in your ideas, and want "an eye for an eye and a tooth for a tooth," and contend that Mr. Stephenson should be punished regardless of the cause that provoked the act. I think in every case the cause should first be well weighed before the act itself is reached. Suppose a burglar should enter your room, and in a struggle with him to protect your property he should kill you; his crime would be murder and punishable by death. But suppose you should kill him, would you think you had committed murder and deserved the same punishment he did? Although you had committed the same act he had you would be honorably acquitted and he hanged. In reply to the criticism of "Inquisitive," I will say Mr. Stephenson refused to make any charge for handling Lillian, both before and after the trials. What he did receive was a present some days after the trials, and he was perfectly ignorant of what it would be until he received it. His interest in Lillian was a handler's, which is often regulated by the winnings. His interest in Ben Hill was an owner's, and could not be lessened by his being handled by another. I received all the entries in the All-Aged stake and Mr. Bedford received the money. I knew Mr. Stephenson entered Ben Hill, Lady C., Noble C. and Minnie S. in person, and the entrance money came out of his pocket. I did hear another person claim to have entered Ben Hill, but I now have written evidence from six of this man's nearest neighbors, who are the best citizens of the county, which convinces me to the contrary. Mr. Stephenson was at a fire, soaking wet and threatened with a chill (but Bob Gates was not with him; what if he had been?); it was raining and totally unfit to run the heat. As one good turn deserves another, why was not Mr. Rose, Daisy F. and the judges sent to hunt him up if he had bolted?

Dr. Young is not related to Mr. Stephenson, but is a cousin of Mrs. Stephenson. If his winning first prize is due to this relationship would it not be well to inquire if his grandfather did not at some time give the grandfather of one of the judges at High Point a chew of tobacco, or some of his remote ancestors trade horses with the ancestors of one of the judges at Grand Junction in '85 and Canton in '84? "Inquisitive's" informant must have been quite nervous about the revolvers being handed around. The first I heard of them was when I saw it in print. If they were being handed around they failed to give me one or notify me "to be ready in case of emergency." Drowning men catch at straws, and frightened children scream at their own shadows. Straws are saw logs compared to the imaginary cobwebs "Inquisitive" clutches at when he suggests these surmises to be facts. If the committee based their decisions on such facts (?) as these no wonder they made such a blunder. They should have dealt with facts and not the fancies of a frightened brain, which could see phantom revolvers floating in the air "ready for an emergency." The rule is exactly as I quoted it, and for once I agree with "Inquisitive" its purpose and spirit should be considered. I have answered all of "Inquisitive's" questions to the best of my ability, and wish to ask him only one, which he can easily answer without betraying his identity. Do you reside at Knoxville? If you do, mail me a card from there with "Inquisitive" written on it by yourself.

Now, a few words about reporters. I do not think my expression conveyed the idea that all reporters could be bought. I had no such intention, as I have the highest regard for an honest, independent reporter, one who would scorn any attempt at bribery and treat it as an insult; one who would consider it base to eulogize an advertiser's dog above its merit and detract from the well-earned laurels of another from spite or revenge. Whenever a paper unjustly writes up some dogs and writes others down it matters not whether it is from favoritism, envy, jealousy, revenge or bribery, its report should be treated with contempt by the public and looked on as an imposition on their confidence. D. BRYSON.

MEMPHIS, Tenn.

ANOTHER LARGE MASTIFF BITCH PUPPY.—*Editor Forest and Stream:* I have a mastiff bitch puppy, sired by Ilford Caution, which, at 7mos. of age, weighed 106lbs. Why won't Mr. Haldeman give us the measurements of his puppy? Weight is not all we are striving for. Below are some of the measurements of mine: Length from tip of nose to stop, 3¼in.; girth of muzzle, 13in.; girth of skull, 22in.; girth of neck, 22in.; girth of body behind forearms, 33in.; girth of loin, 28in.; girth around stifle joint, 19½in.; girth below elbow, 10½in.; girth of forearm, 9in.; girth around pastern, 6¼in. This puppy is not for sale.—E. H. MOORE (Melrose, Mass., Jan. 28).

A PLEA FOR PUPPIES.

Editor Forest and Stream:

We sent our promising puppies to the shows last spring, healthy, strong, and so full of life that they could hardly be persuaded to take any pace slower than a gallop. During the first day they were frisky and jolly, excited by the strange sights and babel of sounds, and quite wide awake until 10 o'clock emptied the hall of people. Then they seemed to think it was cold and very far from home. The next morning they were brought into the judging ring, but already the novelty had departed; teazing and caressing visitors had worried them, breakfast had not had its usual relish, they had missed their early game of romps out in the exhilarating morning air, and with utter indifference most of them faced the judge, one or two even declining to stand up and greet him. Then back to their stalls they went, very proper and quiet, without tugging at their chains or giving the attendants any trouble. The day wore away and with it all their energy. Sleep, happy sleep, was all they craved, and visitors could hardly rouse them for a friendly hand shake. A kind friend whom they remembered enough to greet with hoarse bark of welcome, gave them a run around the hall, and even took them out into the street for a blessed half hour, so that they were quite fresh and bright when evening thronged the hall with people again. But how wretchedly weary and forlorn were the poor things when the third day began. So meek and apathetic had they become that they swallowed pills without a murmur, and even submitted to the administration of a generous dose of salt with which a wiseacre sought to revive them and make them "show up" better. Two walks they had, out of doors, and one in the hall, besides other kind attentions, and really seemed like themselves for a time. But at night they pined for a change of air, and all the tedious hours of the fourth and last day they were so dull and stupid that visitors found them very uninteresting and openly wondered that such dogs had won any prizes. At last the show came to an end, the pups were hurried from their benches and into their crates to catch the midnight train, homeward bound. More weary hours in the crowded car, and home at last, drooping, dispirited, worn out, thin and languid. In a day or two they seemed to regain something of their former condition and spirit, but within a week all were ill with distemper, and the disease had also attacked some of their stay-at-home kennel mates. For months our kennels were only a series of hospitals, and several besides the unfortunate prize winners succumbed to the dire disease.

This is no fictitious case, but a statement of sad fact. How many other breeders can tell a similar tale? The spring shows are at hand and more victims are being prepared for the sacrifice, for what breeder worthy the name lacks ambition, and what breeder thinks he has no puppies to show? Since there will be puppy classes and puppy entries to fill them can we not do something to ward off distemper? Gentlemen of the bench show committees, will you not think of the puppies as well as the grown dogs in making out your schedules? Would it not be a good thing to let all puppies go home at the close of the second day, while they have some strength with which to combat distemper should it attack them? I am told that this plan has succeeded admirably, and I wish it might be tried at our shows this spring. Brother breeders, have you all resolved never to show any more puppies after the losses of last year? Or have you forgotten your trials and are you ready to exhibit a few more grand puppies presently. What do you say to a two-day limit for puppies and a four-day limit for grown dogs? Or would you prefer to have no puppy classes? A SUFFERER.

OUR FIELD TRIAL.

Editor Forest and Stream:

We, who live so far from the scenes of the great field trials that we cannot conveniently avail ourselves of the opportunities to judge of the merits of our dogs that those contests would afford, concluded recently to inaugurate a series of local field trials to decide which of us possessed the best trained dog. Christmas day, selected for our first meet, dawned clear and balmy as May. Many of the owners and handlers of the dogs entered had been up late the night before assisting in the distribution of presents to the children from the various Sunday school Christmas trees in the city (so they said), and in consequence of the fatigue incidental to these festivities, failed to appear in time for the start. However, two enthusiastic individuals with their canines were promptly on hand, and nothing daunted at the paucity of contestants, determined to carry out their part of the programme. As the negroes, with their "Zulus," have potted all the birds in the immediate vicinity of town, it was necessary to go some distance to find suitable grounds for the contest. The dogs that came to the scratch were Webster's celebrated liver and white pointer Dash Blank and "Guadalupe's" famous English setter Count No-Account.

A little difficulty was experienced at the outset, as the dogs on being put into the back part of the wagon at once began to fight like a couple of Kilkenny cats. They were separated eventually, after having been admonished with a club, one was left in quiet and safe possession of the rear part of the wagon, and the other given a seat in front. Arriving on the ground, the brace was put down (I believe that is the correct phraseology) near an extensive hedge, and immediately got to work. After a short run Dash Blank pointed and drew on, working out a bevy that was running in the hedge. The Count lay down to bite a grass burr out of his foot. He was kicked up by his handler, and exhibited a fine burst of speed getting out of the way. Seeing Dash standing rigidly on a point and looking in his direction, the Count evidently concluded it was a challenge and went for him in fine style. Alarmed at the tumult the bevy—a large one—flushed with a great racket, which attracted the attention of the fighting dogs, who left off chewing each other and lit out after the birds. After running the best part of half a mile, unmindful of the vigorous blowing of whistles and shouting on the part of the handlers, the dogs having failed to catch any of the birds, returned and lay down in the shade to rest. One chase was scored against each dog.

After cooling off they were sent on and shortly came together on a point close to the hedge. Webster, to order, flushed, but it was a cotton tail rabbit which he missed very neatly with both barrels. He also missed the dogs, but it was a close call for all concerned. After the dogs discovered they could not catch the rabbit they returned, got down to business again and, in a short time, were racing up and down the hedge in pursuit of a bevy that would neither flush nor stand still long enough for the dogs to get in a respectable point. Webster was ordered to flush, but he couldn't. The hedge was of Cherokee rose, 12 to 15ft. wide and averaged about 8ft. high. In the expressive language of Dash's owner, "if they didn't want to flush, they didn't have to." He also suggested that a mark be scored against the birds, but as that was a proceeding I could not recollect ever having seen chronicled in the published reports of field trials, I objected, and advised that he fire into the hedge and scare them out. This advice being acted upon proved entirely successful. The birds were marked down in the middle of the field, but as soon as they touched the ground they set out in a run for the hedge on the opposite side and succeeded in getting there ahead of the dogs. It was a pretty race, but the birds won by about five dog lengths. One mark was scored against each dog for not beating the birds and getting between them and the hedge.

Arriving there we found both dogs pointing beautifully. The bevy was flushed without much difficulty, and as they rose four shots rang out almost simultaneously. One bird dropped, winged and started to run, but Dash had his eagle

eye on it and after a short chase caught it. On being ordered to retrieve he laid down and began to chew the bird. Webster got to his dog as quickly as possible, but alas! all that remained of the bird was an unrecognizable mass of flesh and feathers. When excited, as on this occasion, Webster has a peculiar manner of addressing his dog. He said: "Dash blank your Dash-blanked hide; I've a great notion to shoot your Dash-blanked head off."

The Count next made a fine point to a single, which his handler flushed and winged. The dog was sent to retrieve and worked very prettily. After catching the bird he brought and laid it at his handler's feet, when it jumped up and ran into the hedge, where it was safe from further pursuit.

Dash now made a point at the hedge, the Count backing him nicely. Webster approached cautiously, and spying a cotton-tail under the brush in front of the dogs, he blew its head off at about 10ft. distance. After much scrambling and scratching Dash succeeded in getting under the thorns far enough to get hold of the rabbit and draw it forth. The Count immediately seized the game by the opposite end and a tussle began for its possession, which resulted in its being torn in two. This was such a palpable error on the part of both dogs that it could not be overlooked, and while we were debating as to how it ought to be scored the Count lay down and ate his half of the rabbit.

They next started a jack-rabbit, and away they flew in a race for life and death, the rabbit in the lead, Count second, and Dash a good third. A couple of charges of No. 8s sent after them failed to stop any one of the trio. The dogs, with their embarrassing peculiarities being out of the way, the handlers got in some good work on the birds, making a fine bag. When lunch time arrived we adjourned to the wagon to enjoy that intermission, and see if we could hear anything of the dogs. We found them under the wagon with lolling tongues and panting sides. After treating them to refreshments from the end of a stakerope, they were tied to the wagon and left there for the balance of the day, which the handlers put in with the birds.

After comparing notes on the heat it was decided a draw. The dogs appeared to have equally good noses and each paid about the same amount of attention to the commands of his handler. It was admitted that Dash Blank could get furthest into the hedge, but this was offset by the Count's superior retrieving, and as we were not at the outcome of the race after the jack-rabbit, that event was not taken into consideration. I am convinced that very few field trials result so satisfactorily to all concerned as did ours. We propose to renew the contest on the first favorable opportunity, when we hope for a larger attendance and an increase in the number of entries. Parties from abroad wishing to enter their dogs should apply care of FOREST AND STREAM to GUADALUPE.

VICTORIA, Texas.

BOSTON DOG SHOW.—Boston, Jan. 29.—*Editor Forest and Stream:* The Bench Show Committee of the New England Kennel Club have completed their premium list, which is to be ready for the public in a few days. The statement is made that it is exceedingly liberal. Some of the more noticeable features of which is the large amount of money offered, the addition of a third prize in all classes, a large money special for the best kennel of not less than four dogs (one owner); and the club stud dog medal when two best of his get are shown; also the insertion of a new rule allowing puppies to be withdrawn on the second day of the show. The list of judges is as follows: Messrs. James Mortimer, Babylon, L. I., mastiffs, St. Bernards, and pugs; John Davidson, Monroe, Mich., pointers, English setters, greyhounds, deerhounds and foxhounds; W. H. Pierce, Peekskill, N. Y., Irish and Gordon setters; A. Clinton Willmerding, New York, spaniels; T. R. Varick, Manchester, N. H., bull-terriers; Ronald H. Barlow, Philadelphia, Pa., bull-dogs, fox-terriers, Newfoundlands, dachshunde; S. T. Mercier, England, collies; H. F. Schellhass, Brooklyn, N. Y., beagles; Edward Lever, Philadelphia, Pa., Skye, Scotch, Bedlington, wirehaired and Irish terriers, toy spaniels and Yorkshires. The benching will be in the latest English fashion, introduced by Spratts Patent, Limited, and has open wire-work partitions, porcelain-covered feed and water dishes, class numbers, prizes, etc., etc. The addition of these novelties will assuredly prove a great attraction, and add much to the success of the show.—BENCH SHOW COMMITTEE.

BUFFALO DOG SHOW.—There will be a dog show at Buffalo, N. Y., March 8 to 11; Mr. J. Otis Fellows has been appointed superintendent. He writes that there will be 72 classes provided for with premiums of $10 and $5, and $5 to puppies in the open classes and a sweepstake of $5 in the champion classes with $5 added. There will also be some valuable special prizes.

THE ENGLISH FIELD TRIAL DERBY.—The entries for the English field trial Derby, to be run in April, closed with 149 nominations, 84 pointers and 65 setters.

KENNEL NOTES.

Notes must be sent on prepared blanks, which are furnished free on receipt of stamped and addressed envelope. Sets of 200 of any one form, bound for retaining duplicates, are sent for 30 cents.

NAMES CLAIMED.

☞ **Notes must be sent on the Prepared Blanks.**

Robert's Mark, Mary Anderson, Lady Queen, Madam Langtry and Kent Queen II. By Clifton Kennels, Jersey City, for liver and white pointers, one dog and four bitches, whelped Jan. 27, 1887, by Robert le Diable (Croxteth—Spinaway) out of Kent Queen (Dash III.—Daisy).

Claudius, Belle of Waverly and Jule. By T. H. Dwyer, Waverly, N. J., for liver and white pointers, one dog and two bitches, whelped Nov. 26, 1886, by Nick of Naso (A.K.R. 4391) out of Polly (Beaufort—Nymph).

Go Bang. By Thos. Johnson, Winnipeg, Man., for liver and white ticked pointer dog, whelped May, 1886, by Bang Bang out of Phœbus.

Gretna. By Thos. Johnson, Winnipeg, Man., for liver curly-coated retriever bitch, whelped Nov. 20, 1886, by Old Don (Regent—Betsy) out of Lucy (King Coffee—Lady Truth).

Flounce. By W. S. Brown, New York city, for orange and white English setter bitch, age and pedigree unknown.

Blanche. By Jas. E. Maddrah, West Winsted, Conn., for white bull-terrier bitch, whelped May 8, 1886, by Count (A.K.R. 3178) out of Miss Doonie (A.K.R. 2193).

Sagamore Norah. By Sagamore Kennels, West Medford, Mass., for black, white and tan English setter bitch, whelped Dec. 13, 1886, by Joe (A.K.R. 4567) out of Bessie II. (A.K.R. 3965).

Flossie. By F. M. Shelley, Sheridan, N. Y., for white, black and tan beagle bitch, whelped Oct. 11, 1886, by Racer (Rally—Lill) out of Maggie (A.K.S.B. 3211).

Speculation. By F. M. Shelley, Sheridan, N. Y., for white, black and tan and ticked beagle dog, whelped Aug. 11, 1886, by Ringwood (Ranter—Beauty) out of Fanny.

Madge. By Dr. Wm. Jarvis, Claremont, N. H., for red and white Irish setter bitch, whelped May 25, 1886, by Elcho, Jr. (Elcho—Noreen) out of Meg (Elcho—Rose).

Cassius, Hercules, Brutus, Evangeline, Corinne, Lucretia and Erminie. By Jacob Meyer, Newark, N. J., for tawny and white rough-coated St. Bernards, three dogs and four bitches, whelped Dec. 10, 1886, by Tell II. (A.K.R. 5835) out of Flora II. (A.K.R. 3016).

Bingo, Bigingo and La Petite. By Geo. W. Fisher, Catawissa, Pa., for stone fawn pugs, two dogs and one bitch, whelped Dec. 20, 1886, by Tom Thumb (Boggie—Darkey) out of Bijou (Dandy—Little Nell).

Alpine Kennel. By J. H. Long, Boston, Mass., for his kennel.

BRED.

☞ **Notes must be sent on the Prepared Blanks.**

Myrtle—Gus Bondhu. H. Merriam's English setter bitch Myrtle to A. M. Tucker's Gus Bondhu, Jan. 18.

Dora Gladstone—Gus Bondhu. A. M. Tucker's (Charlestown, Mass.) English setter bitch Dora Gladstone to his Gus Bondhu, Dec. 25.

Lynn—Gus Bondhu. E. E. Hayden's English setter bitch Lynn to A. M. Tucker's Gus Bondhu, Jan. 21.

Bessie II.—Gus Bondhu. A. M. Tucker's (Charlestown, Mass.) English setter bitch Bessie II. to his Gus Bondhu, Jan. 27.

Amie—Otho. B. H. Warder's (Springfield, Mass.) rough-coated St. Bernard bitch Amie (Tell—Noma) to Hospice Kennels' Otho (A.K.R. 483), Dec. 8.

Apollonia—Otho. Hospice Kennels' (Arlington, N. J.) smooth St. Bernard bitch Apollonia (A.K.R. 4418) to their Otho (A.K.R. 483), Dec. 3.

Clio—Otho. Alta Kennels' (Newport, Ky.) rough-coated St. Bernard bitch Clio (A.K.R. 1441) to Hospice Kennels' Otho (A.K.R. 483), Dec. 25.

Belline II.—Hector.—Hospice Kennels' (Arlington, N. J.) smooth-coated St. Bernard bitch Belline II. (A.K.R. 3033) to their Hector (A.K.R. 4425), Jan. 29.

Tipy—Tom Thumb. Wesley Baughart's (Catawissa, Pa.) pug bitch Tipy to Geo. W. Fisher's Tom Thumb (Boggie—Darkey), Dec. 5.

Topsy—Tom Thumb. William Swartzwelter's (Catawissa, Pa.) pug bitch Topsy to Geo. W. Fisher's Tom Thumb (Boggie—Darkey), Jan. 20.

Queen V.—Argus II. H. W. Thayer's (Franklin, Mass.) Gordon setter bitch Queen V. (Gem—Rose) to Geo. E. Brown's Argus II. (Argus—Beauty), Dec. 9.

Bredna—Dash B. Manitoba Kennels' (Winnipeg, Man.) English setter bitch Bredna (Mark—Betsy) to their Dash B. (Dash Bryan—Lilly), Jan. 22.

Cambria—Mark. Manitoba Kennels' (Winnipeg, Man.) English setter bitch Cambria (Cambridge—Pet Laverack) to their Mark (Druid—Star), Jan. 24.

Novelette—Royal Prince II. Manitoba Kennels' (Winnipeg, Man.) English setter bitch Novelette (Royal IV.—Novel) to F. Leonard's Royal Prince II. (Sir Alister—Novelty), Jan. 24.

Village Belle—Bacchanal. F. C. Wheeler's (London, Ont.) fox-terrier bitch Village Belle (Volo—Beauty) to A. Belmont's Bacchanal (Belgravian—Bedlamite), Jan. 1 and 5.

Jeanette—Don Quixote. H. E. Burkmar's (Rockland, Me.) pointer bitch Jeanette (A.K.R. 2475) to F. W. White's Don Quixote (Robin Adair—Lady Belle), Jan. 23.

Noreen—Elcho. Wm. Jarvis's (Claremont, N. H.) Irish setter bitch Noreen (Garryowen—Cora) to his Elcho (Charlie—Nell), Dec. 29.

Romaine—Elcho, Jr. Wm. Jarvis's (Claremont, N. H.) Irish setter bitch Romaine (Elcho—Rose) to his Elcho, Jr. (Elcho—Noreen), Jan. 24.

Ruby—Elcho, Jr. W. G. Simons's (Manchester, N. H.) Irish setter bitch Ruby (Berkley—Siren) to Dr. Wm. Jarvis's Elcho, Jr. (Elcho—Noreen), Dec. 17.

Lorna—Elcho, Jr.—Wm. Jarvis's (Claremont, N. H.) Irish setter bitch Lorna (Elcho—Rose) to his Elcho, Jr. (Elcho—Noreen), Nov. 26).

Bess—Sarsfield. G. H. Parkinson's (Middletown, Conn.) Irish setter bitch Bess (Glencho— ———) to Wm. Jarvis's Sarsfield (Garryowen—Currer Belle II.), Dec. 14.

Red Flash—Sarsfield. H. B. Draper's (Catskill, N. Y.) Irish setter bitch Red Flash (Glencho— ———) to Wm. Jarvis's Sarsfield (Garryowen—Currer Belle II.), Dec. 25.

WHELPS.

☞ **Notes must be sent on the Prepared Blanks.**

La Duchesse. Hospice Kennels' (Arlington, N. J.) rough-coated St. Bernard bitch La Duchesse (A.K.R. 3022), Jan. 11, five (two dogs), by their Otho (A.K.R. 483). One bitch dead.

Lady Pluto. Geo. H. Whitehead's (Trenton, N. J.) cocker spaniel bitch Lady Pluto (Obo II.—Blackie III.), Jan. 7, five (four dogs), by American Cocker Kennels' Doc (A.K.R. 3795).

Bijou. Geo. W. Fisher's (Catawissa, Pa.) pug bitch Bijou (Dandy—Little Nell), Dec. 20, four (three dogs), by his Tom Thumb (Boggie—Darkey).

Lorna. Dr. Wm. Jarvis's (Claremont, N. H.) Irish setter bitch Lorna (Elcho—Rose), Jan. 26, twelve (five dogs), by his Elcho, Jr. (Elcho—Noreen).

Flora II. Eugene Taylor's (Lynch's Station, Va.) English setter bitch Flora T. (Rebel Wind'em—Fleeta), Jan. 6, six (five dogs), by Henry Colquitt's Comedy (Dashing Rover—Trinket).

Lucy. Manitoba Kennels' (Winnipeg, Man.) English curly-coated retriever bitch Lucy (King Coffee—Lady Truth), Nov. 20, six (one dog), by their Old Don (Regent—Betsy).

Belle. Manitoba Kennels' (Winnipeg, Man.) English setter bitch Belle (Cable—Bredna), Jan. 6, six (four dogs), by their Royal Prince II. (Sir Alister—Novelty). One dog living.

Dudley Rage. F. C. Wheeler's (London, Ont.) fox-terrier bitch Dudley Rage (Pickle II.—Frantic), Jan. 5, five (three dogs), by A. Belmont's Regent Vox (Tackler—Sandy Vic).

Kent Queen. Clifton Kennels' (Jersey City) pointer bitch Kent Queen (Dash III.—Daisy), Jan. 27, twelve (six dogs), by Highland Kennels' Robert le Diable (Croxteth—Spinaway).

SALES.

☞ **Notes must be sent on the Prepared Blanks.**

Doc—Rhea whelps. Black cocker spaniel dogs, whelped Nov. 24, 1886, by American Cocker Kennels, Camden, N. J., one each to Thos. F. Hickey, Trenton, N. J. and Samuel Margerum, same place; one black, white and tan dog to Harry Curnow, Philadelphia, Pa., and one black with white frill bitch to J. D. Baldwin, Philadelphia, Pa.

Nick of Naso—Polly whelps. Lemon and white pointer dog, whelped Nov. 26, 1886, by Thos. H. Dwyer, Waverly, N. J., to Geo. L. Wilms, Jersey City, N. J., and two bitches to W. Hepsley, Jersey City, N. J.

Royal Prince II. Blue belton English setter dog, whelped January, 1884, by Sir Alister out of Novelty, by Manitoba Kennels, Winnipeg, Man., to F. Leonard, Pawtucket, R. I.

Daphne K. Lemon and white pointer bitch, whelped May 26, 1884, by Currier's Prince out of Currier's Chip, by Fred W. White, Worcester, Mass., to Wm. A. McCausland, Washington, Pa.

Royal Prince and Luretta II. Liver and white pointer dog and bitch, whelped Aug. 4, 1886, by Croxteth out of Van, by R. G. Hall, Portland, Me., to S. G. Bennett, North Woburn, Mass.

Romaine (A.K.R. 638). Red, white spot in cheek, Irish setter bitch, whelped June 17, 1881, by Elcho (A.K.R. 295) out of Rose (A.K.R. 295), by G. F. Wells, Boston, Mass., to Dr. Wm. Jarvis, Claremont, N. H.

Miss Bracket. Liver and white pointer bitch, whelped June 30, 1886, by Bracket out of Rosa (A.K.R. 1443), by J. H. Phelan, Clifton Kennel, Jersey City, to M. Fielder, Newark, N. J.

Rosa. White and liver ticked pointer bitch, whelped May 2, 1882 (A.K.R. 1443), by Clifton Kennels, Jersey City, to J. P. Cartwright, Augusta, Ga.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

CONSTANT READER, Frostburg, Md.—The defect will probably not at all interfere with the dog's usefulness in the stud. Both organs are probably present, one not having descended.

RIFLE.—What had I better give my 3yrs. hound for worms? He is in fair condition, but they appear to annoy him and he "passes" them as often as I have observed him? Ans. Diet your hound for 24 hours, giving nothing but milk. At the end of this time give one teaspoonful of powdered areca nut rolled into a ball with lard. This may be forced into the throat far enough to prevent the dog from throwing it out. After three hours give a thorough purge of castor oil, a tablespoonful. You may commence treatment with a purge also.

B. F.—My Irish setter seems to be in good health but sheds his hair badly. He does not scratch at all, so the trouble cannot be caused by mange. What shall I do for him? Ans. Give your dog two or three doses of castor oil or two or three of calomel—5-grain doses. Then commence with 5-drop doses of Fowler's solution of arsenic morning and evening in food. Keep up treatment for one month and report.

M. R. G.—1. I have a bitch 9yrs. old. She has never had puppies. She is very fat. Would it endanger her life to have puppies now? 2. What is best book for breaking or training puppies? Ans. 1. It would be better to have the bitch thinner. It would probably not endanger her life, however, to have pups. By exercise, cathartics and limited diet you should be able to bring her flesh down. 2. Hammond's book, "Training vs. Breaking," is the best.

H. S. C.—My fox-terrier bitch has been shedding her coat very badly for the past two weeks; vomits sometimes two or three times daily; at times the matter seems digested, at others indigested, and again nothing but greenish fluid; otherwise she seems very well and lively, but rather subject to shivering for no apparent reason. Ans. Give 10grs. of calomel in two doses—morning and evening. Diet her, feeding very little meat. Give 5 drops of Fowler's solution of arsenic in the food morning and evening for 3 or 4 weeks.

J. S. W., Toronto.—I have a spaniel bitch, 10½ mos. old, which will, I suppose, soon be coming in heat. I do not want to breed her. Please say if I can give her anything to shorten the period. Her hair also comes out badly. Is there any way of stopping that? Ans. When the bitch comes in heat you might try ten-grain doses of bromide of potash in solution daily. The best way to keep her from breeding is to tie her up during the heat where dogs cannot get at her. Give five-drop doses of Fowler's solution of arsenic morning and evening to improve the skin. Keep the bowels free.

F. E. P., South Boston.—My two beagles stuff up in the nose, and sneeze very hard and almost constantly, especially toward evening. Otherwise they are in good health and active. The older dog has been this way for nearly two months, and the other has just begun. They have a habit of scratching the inside of the ear a good deal, also. There is no smell, and I can see no eruptions nor matter. Can a puppy of 6 mos. have canker in the ear? Ans. Very likely the puppies have canker. Get the following: Of bromo-chloral and of laudanum one dram each; of water six drams. Mix. Drop a little in the ears night and morning after cleansing. Give four drops of Fowler's solution of arsenic night and morning in the food. Keep the bowels in order with syrup of buckthorn in teaspoonful doses.

Rifle and Trap Shooting.

Address all communications to the Forest and Stream Pub. Co.

RANGE AND GALLERY.

REVOLVERS.—New Haven, Conn.—Is there now on the market, or is there likely to be soon placed on the market, a neat, well balanced, well made and accurate shooting revolver, with which satisfactory target practice can be had, whether the target be stationary or moving? I am aware that there are plenty of revolvers now for sale, but they are all nearly worthless for practical purposes, both on account of their general make-up and the ammunition which they use. Many alterations and improvements are needed in both before any degree of perfection can be attained. [There are now on the market revolvers with which accurate work can be done. See report in our issue of Nov. 25, 1886, of work done at Conlin's gallery, this city, with Smith & Wesson and Colt .32cal. revolvers.]

NEW YORK, Jan. 27.—The challenge of Mr. Dorler, of the Zettler Rifle Club, published in your paper, was accepted by Mr. Snellen, of the Essex Rifle Club, of Newark. Terms, 150 shots each in the Zettler gallery, 150 shots in the Essex gallery, Newark; 12-ring target, usual gallery conditions. Following are scores of first 150 shots, in Zettler gallery:

Dorler.											Snellen.

A NEW CREEDMOOR.—A special meeting of the board of directors of the National Rifle Association was held during the past week to hear the report of the committee appointed to examine a plot of ground on Staten Island that has been offered to the Association for a rifle range. For a long time there has been a feeling against Creedmoor on account of the high rate charged by the Long Island Railroad Company, and the great amount of time required in getting to and from the range. In view of these facts Lieut. Zalinski has been quietly examining several sites that might answer as a rifle range. In his report, as chairman of the committe, he stated he had succeeded in securing the refusal of a piece of ground containing 100 acres, which he considered admirably adapted for a range, and that Mr. Erastus Wiman, on behalf of the Staten Island Rapid Transit Company, had guaranteed to sell round trip tickets at thirty cents each, and also erect a station on the railroad within five minutes walk of the range, where all trains should stop. Lieut. Zalinski also stated that he had been promised several thousand dollars toward the purchase money if the Association decided to buy the property, and that he thought the balance of the money required could be raised by an appeal to the public. The meeting adjourned till Feb. 15; in the meantime a survey of the land will be made by a Government engineer.

MASSACHUSETTS RIFLE PRACTICE.—Col. Horace T. Rockwell, Inspector-General of Rifle Practice in the State Guard of Massachusetts, has submitted an interesting report of the work performed, while the comments of such an experienced shot as the captain of the now champion military team of the country are worthy special attention. He puts the growth of rifle practice in the State in a clear tabular form, as follows:

	1883.	1884.	1885.	1886.
No of qualifications, sharpshooters	94	96	78	121
No of qualifications, first class	133	184	204	271
No of qualifications, second class	253	268	362	431
No of qualifications, third class	139	156	234	317
Requalifications	780	1273	1915	2757
No qualified or requalified during the year	509	644	878	1159
Issue of badges, all classes, aggregate	545	795	1058	1442
Marksmen in service close of year	51	66	66	68
Co.'s performing armory practice	42	64	65	66
Co.'s performing field practice	37	54	56	63
Co.'s entering teams, State match				150;

The list of sharpshooters for 1886 is: Highest possible score, 150; requisite for qualification, 129; viz., 43 at each of three distances, 500, 600 and 800yds.

1 Col H T Rockwell, A I G, staff commander in chief.....160
2 Capt C W Hinman, I R P, 1st brig.....141
3 Capt J B Osborn, 2d M, 1st brig.....132

16 Priv F D Gartlett, Co D, 1st corps cadets.....136
17 Priv L Grant, Co D, 1st corps cadets.....148
18 Sergt C A Parker, Co D, 1st corps cadets.....140
19 Priv M W Daulton, 2d corps cadets.....136

Taking the foregoing record by itself, a degree of progress is indicated greater than that recorded in any previous year. But other striking evidences of improvement are to be found in the averages of performance at the State rifle matches, in the scores at the mid-range match held for the first time this year, and in the success of the team sent to Creedmoor. On the whole, it may be said that more interest has been shown and better results achieved than ever before.

Of the 100 rifles, latest pattern, received early in the year, it was possible to distribute only 56 to companies; and, as one of the objects of obtaining them was to place in the hands of the most expert men fit arms with which to enter into national competitions, the distribution was made upon the basis of the record of the highest class of marksmanship in the companies. This accomplished the purpose in the fairest way possible; but when the time came for our State matches it was felt by some that companies holding the new rifles possessed an undue advantage. It is my judgment that individual work at 200yds. depends very much less upon the arm than upon the individual capacity and habitual practice with the piece used, and that the "advantage" (at the distance named) of any particular arm is somewhat fanciful. Nevertheless, I deem it desirable that a sufficient number of the new rifles be obtained to place at least two in every company in the militia.

I have obtained returns from the entire militia of the State of some useful details of their armory arrangements, the provision made by local authorities as to targets and the expenditures of ammunition over and above State allowances. From these it appears that there are very few companies which have not provided themselves with permanent appliances for armory practice; but that quite a large number have thus far been unable to secure any co-operation from their town authorities in respect to facilities for field practice. This is one of the matters which regimental inspectors may be expected to assist in rectifying.

It also appears that a majority of the companies, and particularly those which show the result of faithful work, use a great deal of ammunition beyond that furnished by the State. Probably much of it is reloaded ammunition; and it would hardly be possible that companies should continue their large expenditures if they were to purchase fixed ammunition at factory prices. It is desirable that the use of reloaded ammunition shall be encouraged and it is but just that those companies which are doing so much at their own expense should be assisted as much as possible. Therefore, while recommending that the general issues of ammunition be made upon the same basis as heretofore, I recommend an additional issue, in cases indorsed by regimental inspectors and approved by superior officers of the materials for reloading (excepting shells and powder) to such an extent as may be found within reasonable limits of expenditure.

MANCHESTER, N. H., Jan. 2.—The challenge rifle match, 100 shots per man, between T. T. Cartwright and O. W. Horr, of Springfield, Mass., and A. B. Dodge and C. D. Palmer, of this city, which was to have been shot to-night, did not take place because of a request from Mr. Cartwright that the match be deferred, as he was to shoot a money match to-day, and believed that the shooting of a match the night before would unfit him for the more important event of to-day. Mr. Palmer put in a practice string of 100 shots Thursday night, scoring a total of 480, making a run of 34 consecutive bullseyes, and again a run of 21.

Jan. 24.—The match between T. T. Cartwright and E. T. Stephens for a purse of $40 was shot Saturday and resulted in a very close and exciting contest, considerable money changing hands on the result. Mr. Cartwright's friends took all bets offered. The scores were as follows:

Cartwright.										Stephens.										
5	6	8	9	8	7	9	6	7	9-74	6	9	8	8	7	9	6	7	7	6-73	
4	5	8	6	9	9	6	4	7	5-63	6	7	7	6	6	6	7	8	8	5-66	
7	7	10	7	6	10	7	6	10	7-213	5	9	6	6	6	5	6	9	7	7-69—208	

Mr. Cartwright used a Bullard single shot rifle. He also shot a single shot match with T. B. Wilson, both using military rifles, the result being 358 in the latter's favor, decimal count, and 219 to 218 Creedmoor count. Mr. Wilson used a Springfield rifle and Mr. Cartwright a special military made by the Bullard Arms Company. The distance was 200yds. off-hand on the Hinman target.

Jan. 25.—The weather conditions for rifle shooting were first class this afternoon, yet with the exception of C. D. Palmer the riflemen who gathered at the West Manchester range shot below their average. Mr. Palmer did some very fine work and succeeded in making the best 10-shot card of his life. There was a team shoot with the Maynard Rifle Club of Chicopee Falls, Mass., but the scores made are withheld until after Saturday next as the Maynard club will not shoot its scores until Saturday. The prize shooting resulted as follows:

C D Palmer	10	8	8	9	8	10	6	10	10	10—89
"	7	10	10	9	8	9	4	7	10	9—83
F J Drake	5	8	6	7	6	9	6	10	10	10—73
"	7	8	5	5	5	8	8	5	6	8—69
W Morris	9	5	10	10	6	7	7	6	9	4—73
A A Dodge	8	8	7	6	9	5	6	8	6	8—71
G A Leighton	6	3	5	9	7	6	7	8	6	7—66
W J Schonland	4	3	6	5	8	2	3	8	6	2—47

There were several other riflemen participating in the shoot who did not finish cards.

Jan. 29.—The second rifle match between A. B. Dodge and Clarence D. Palmer, of this city, on the one side, and T. T. Cartwright and O. W. Horr, of Springfield, Mass., as their opponents, took place this evening, the conditions being the same as in the first match, viz., Creedmoor target, off-hand, 50ft., bullseye ¾in. in size and each man 100 shots, which gives a possible 500 per man. The first match was won by the Manchester representatives and they also won this evening's contest by an increased lead. The shooting of Mr. Dodge was phenomenal. He consumed an hour and five minutes in the making of his string, while Mr. Palmer put in his 100 shots in 43 minutes, besides doing his own marking and loading. The scores follow:

A. B. Dodge	5545555555—49	C D Palmer	5555554555—49
	5555555555—49		5455555554—47
	5555455555—49		4555454455—46
	5545555545—48		4555444545—45
	5555555555—50		5545555554—48
	5545545555—47		4545555555—48
	5555555555—50		4555554455—47
	5455555544—47		5555455545—48
	5555545554—48		4555544554—46
	5555555545—48		5555545554—49—473
Total of both			960

The score of the Springfield riflemen was. T. T. Cartwright, 457; O. W. Horr, 457; total, 915; a lead of 46 for the home experts. In the first match Mr. Dodge made 473, Mr. Palmer 474, total, 952; Cartwright 451, Horr 461, total, 912.

The next team match in the Bullard Arms Company's series will be shot Feb. 1, weather permitting, when the range will be open all day. The team will consist of Messrs. Dodge, Palmer, Boothby, Colby, Leighton, Paul, Drake, Temple, Partridge, Knowlton.

SPRINGFIELD, O., Jan 21.—The Springfield Rifle team held its regular weekly shoot at the range on Perrin's farm, south of the city, this afternoon. The shoot was at 200yds, off-hand. Some of the boys did not shoot as well as usual, probably because the sudden and severe changes in the weather during the past week had unstrung their nerves. Henry Croft, Sr. carried off the palm, his score of 90 out of a possible 100 points in his second series of 10 shots being very fine. Mr. Croft attributes his success in that series of shots to the use of "patched balls," which are as perfect in every way as it is possible to make them. Following the detailed score:

H Croft, Jr.	8	8	7	7	9	9	6	5	8	5	7—71
	6	7	10	8	9	9	8	8	8	6	8—82
	10	6	8	9	10	7	8	8	10	6	8—81
	6	9	9	10	7	8	4	7	6	10	7—76
J E Perrin	10	9	8	7	10	5	9	5	7	3	7—70
	7	5	6	10	7	7	6	6	6	7	6—67
	10	5	8	5	8	5	9	8	5	5	5—68
C H Rice	3	5	8	9	4	7	6	8	6	8	5—65
	5	6	9	6	5	6	5	6	10	6	6—64
	7	8	7	4	6	5	10	5	8	9	6—66
J C Trimmer	7	9	8	4	7	6	5	7	8	5	6—66
	10	5	6	8	5	6	7	7	7	7	6—68
	5	7	6	6	8	7	9	8	8	5	7—72
H Duke	10	7	9	10	5	6	5	5	8	8	5—73
	7	8	5	6	6	6	9	9	4	3	6—64
	7	7	4	5	7	6	9	4	5	9	6—65
H Croft, Sr.	10	10	9	10	10	6	9	7	9	10	9—90
	8	9	8	5	10	6	8	6	6	7	6—73
Smith Davis	6	8	6	5	7	5	3	9	5	6	6—60

ST. LOUIS, Jan. 23.—M. A. Thurber won the medal of the St. Louis Pistol Club's weekly shoot with a score of 110 out of a possible 120. The shooting was very close and exciting, the winner getting there by just one point. Following are the scores:

M A Thurber	11	10	10	11	11	12	11	12	10	10	—110
F A Fodde	12	10	11	11	12	12	10	11	11	9	—109
O Neuhaus	11	12	11	11	12	10	9	8	12	12	—108
W Bauer	10	11	10	12	11	11	10	12	10	11	—108
W E Field	12	11	11	10	9	12	10	9	12	11	—107
W J Laird	12	8	12	12	10	11	10	11	11	10	—107
W G Sims	11	12	11	11	9	11	10	9	10	12	—106
L V D Porter	12	12	12	9	11	12	10	8	10	10	—106
W J Wells	9	11	12	12	10	11	11	11	10	9	—106
A E Beegal	10	10	9	11	12	11	12	10	10	11	—106
W H Hetel	10	9	12	11	9	11	12	8	10	11	—103
W A Jones	11	10	11	12	10	9	11	8	8	12	—102
W H Bonnell	11	12	10	9	11	7	10	10	10	10	—100
W B McDoncll	9	12	9	7	7	11	9	12	12	10	—98

Jan. 29.—The struggle to-night between W. J. Laird and W. G. Sims, for the medal of the Pistol Club, was very exciting, and after shooting off two scores was finally won by Laird. In the first score they tied on 110; in the shoot-off Laird made 109, when Sims again tied; in the last shoot Laird made 110 and Sims dropped to 106. Scores:

W J Laird	11	10	12	10	12	10	11	10	12	12	—110
W G Sims	12	11	12	12	9	12	10	11	11	10	—110
A E Beegel	12	12	8	10	11	10	12	12	12	10	—108
F A Fodde	11	11	12	10	9	11	11	11	10	11	—107
W L Wells	11	10	11	11	12	11	12	9	12	8	—107
M A Thurber	10	11	11	11	9	12	12	12	9	8	—105
W E Field	6	12	12	11	12	11	12	11	9	8	—103
W Bauer	11	11	12	9	10	8	9	10	11	11	—102
W Hettel	8	10	10	10	12	9	9	12	11	9	—100
W H Bonnell	11	11	11	12	11	8	9	8	9	8	— 98
W Clark	11	10	8	11	9	7	10	10	11	11	— 98
O Wallace	7	12	6	12	10	11	9	10	6	9	— 92
J G Schaaf	7	10	6	8	7	7	10	8	7	7	— 77

SAN FRANCISCO, Jan. 16.—The following scores were made to-day by members of Co. G, N. G. S. C., at the 200yds. range, Sharps military rifles:

Capt Hall	4443555554—42	Pvt McMillan	2323444444—36
Sergt Mott	4444442244—36	Pvt McKenna	3443445434—37
Sergt Sewell	5444444444—41	Pvt Klein	3324355433—35
Corp Quinn	3422434453—35	Pvt Viemeister	3334452254—35
Pvt Bouse	4445444444—41		

Scores of honorary members, same range:

Capt Coffey	4444454444—41	Sergt Little	4544444533—40
Sergt Hughes	3444545544—42	Corp Hughes	5544455545—45

Jan. 23.—Notwithstanding the exceptionally fine day for rifle shooting there were no regular matches among the rifle teams at Shell Mound Park ranges. R. G. Moore of Company A and F. P. Coulter of Company F of the Fifth Infantry, however, engaged in a practice shoot at the ranges, and made creditable scores as follows:

200yds.		500yds.	
Poulter	4454445554—44	Poulter	5555455545—48
	5444554546—45—89		3454545454—43—91
Moore	5545555444—45	Moore	5455454355—45
	5554444444—43—88		4555554554—47—92

At the ring targets:

Moore	25	17	19	20	23	15	17	18	17	19	—190
	22	21	15	22	14	20	24	10	16	23	—187—377

	17	19	16	19	22	19	23	17	18	15	—185—384

WHITWORTH.—The death of Sir Joseph Whitworth, the famous rifle inventor, which took place at Monte Carlo on the 22d ult., was announced from London on the 24th. Sir Joseph Whitworth, Baronet, F. R. S., was born at Stockport, England, in 1803, and when fourteen years of age was placed under the care of his uncle, a mill owner in Derbyshire. When twenty-two years old he went to London, thoroughly dominated by the idea of attaining perfection as a mechanician. Sir Joseph's name first came prominently before the public when he exhibited his plans and other improvements at the Exhibition of 1851. In 1853 he was a commissioner to the exhibition in New York, and in 1854, when the English Government was anxiously seeking to perfect its military armament, Sir Joseph turned his attention to the improvement of the rifle, and it is his work in this direction which has made his name most widely celebrated. At a time when the Enfield rifle was considered an admirable weapon, the performances of the Whitworth rifle astonished everybody. The rifle was not stumbled upon by accident, but was accurately thought out from the first. His success in this direction soon made him a competitor with Sir W. G. Armstrong in his efforts to produce perfected ordnance and projectiles. The system of polygonal rifling invented by Sir Joseph is still in use to-day. In his great works at Charlton street, Manchester, may be seen regiments of steel ordnance and an army of those flat-headed steel projectiles which Sir Joseph has persistently advocated. In 1868 he founded the "Whitworth scholarships" in mechanical science, thirty in number, of the annual value of $500. He was made a baronet in 1866.

DENVER, Col., Jan. 29.—A special from Pueblo to the *News* says: Colorado lawyers have made use of the Supreme Court decision on the invalidity of criminal convictions by information to obtain the release of Hamilton, alias Burton, from the penitentiary at Albany, N. Y., where he is serving a sentence for robbing a mail stage near Alamosa in 1881. He had built a pile of brushwood across the road in the woods, and set up blackened sticks in such a way as to look like gun barrels pointing at the coach. Having stopped the coach, Hamilton made all the passengers form in line. He then made motions back toward the supposed band of riflemen, telling them not to shoot until he ordered them to do so. While the supposed riflemen were covering the passengers with their guns, the latter were robbed of their valuables by Hamilton, who escaped into the mountains.

NEWARK, Jan. 27.—Our Own Rifle Club shot this evening on the new range at No. 93 Mercer street for the club trophy, a diamond badge for teams. Each man fired ten shots, with a possibility of scoring fifty. The result was as follows: Team No. 1—G. Snellen, Captain; Ferd. Freiensehner, 44; Weider, 39; Friedenbeit, 41; Klem, 29; Kiefer, 37; Snellen, 47; total, 237. Team No. 2—John W. Gill, Captain; Limberger, 39; Bertram, 39; Drexler, 36; Dietzel, 38; F. A. Freiensehner, 42; J. W. Gill, 37; total, 231.

WALTHAM, Mass.—The several companies of firemen in Waltham have organized a rifle tournament; 30 matches will be shot, 3 each week. The contest opened Jan. 25.

THE TRAP.

Scores for publication should be made out on the printed blanks prepared by the Forest and Stream, and furnished gratis to club secretaries. Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

BUFFALO, N. Y., Jan. 26.—The long talked of pigeon shoot between Jacob Koch, of this city, and George Radger, took place at the Buffalo Driving Park, $250 a side, 60 live pigeons, 21yds. rise, 80yds. boundary. The Canadian led up to the 17th bird, after that he lost:

J Koch.....0110111101111111111111111101011111111111101011111113—43
G Rodgers.....1111011111111101101011110111111011111110111100—39

BROOKLYN, Jan. 28.—The last regular meeting of the Long Island Gun Club took place to-day at Dexter Park, Jamaica Plank road. Out of the large number of members present, thirteen put down their names to compete for the silver cup and money prizes. The birds were supplied by Chas. Durrier, and proved such good ones that out of the 195 shot at 48 escaped, only to be knocked down by the scouters who lined the fence. Mr. Brown, 26yds., did the best shooting and won the cup, after tieing with Pfender. As it was the last shoot of the season the prizes were afterward awarded for the best individual scores. Each man had to shoot at eight of the twelve meetings to entitle him to a chance for a prize. They were awarded as follows. Class A, H. Knebel, $50; Class B, E. Tipping, $20; Class C, E. A. Vroom, $10. Some sweepstakes were shot afterward. Tipping and Pfender divided the first, Brown and Knebel the second, and C. Crecknell took the third. W. Mills was trapper and handler. Score of shoot:

E Tipping, 25yds	1110010—4	P Post, 25yds	0000000—0
H Knebel, 25yds	0010110—3	E Vroom, 23yds'	0100111—4
J Akhurst, 24yds	0101101—3	P Pfender, 25yds	1101111—6
W Green, 27yds	0111011—5	J Smith, 24yds	1011000—3
M Brown, 27yds	0111111—6	F Remsen, 23yds	1111015—5
R Jones, 24yds	1010011—4	I Siscord, 24yds	1111000—4
R Midmer, 25yds	1000110—3		

In shooting off the ties Brown won first and cup, Remsen second.

RALEIGH, N. C., Jan. 26.—Match at live pigeons between Chalmers L. Dick of Johnstown, Pa., and E. B. Engelhard, of Raleigh; 22 birds, 5 ground traps; 5yds. apart; 28yds. riser 5 minutes allowed to retrieve birds; use of both barrels; English rules. Dick used a 10¼lb. 26in. Lefever gun, 10-bore; Engelhard a 10lb. 30in. Parker gun, 10 bore. Score:

Dick	1011111111111111011111011—19
Engelhard	1111111101111001011111118

Dick had right quarterers 7, left 11, incomers 2, drivers 10. Engelhard right quarterers 8, left 7, incomers 2, drivers 10. The wind was blowing almost a gale, and the birds were strong and fast flyers.—S. I. J.

BALTIMORE, Jan. 22.—A clay-pigeon shooting match was contested between the Arlington and Pimlico gun clubs, at Arlington, Baltimore county, this afternoon. The following is the score:

Arlington Club.		Pimlico Club.	
D E Ensor	0101111111111—13	W Bland	1111111111111—15
J O Devries	1111111011111—14	P Bland	1110111001011—11
E Bland	1111111111111—15	E Bowers'ks	0101101011111—11
D Bland	0001111010101—9	S Bland	1011110111111011—12
	51		49

Another match will take place soon.

TORONTO, Jan. 23.—The Owl Gun Club is only in its third season, but has a membership of between forty and fifty, the majority of whom are wing shots of more or less ability, some being among the best in the country. In fact the Owls are a very flourishing institution. To-day they dined—at night, as became them—and at their own roost, 171 King street, east, where comfortable and commodious rooms have been taken. The tables were placed in the billiard room and were elegantly laden with a choice cold collation. Union jacks were draped over the windows and trophies of the chase with works of art illustrative of natural life adorned the walls. Conspicuously placed on the cross-table in front of the chairman, Mr. T. H. Tabor, vice-president, was the handsome and costly Moore challenge cup, which, by the way, was originally made on the order of FOREST AND STREAM as a championship challenge trophy of America. Flanking the chairman were Mr. J. Humphreys, president of the Owls; Ald. Maughan, George Waring, John Wilson and James Douglas, while around the table were John Townson, Robert Chariton, J. C. Unwin, Charles Kemp, W. J. Dwyer, H. Townson, A. J. Symon, William Unwin, F. Mallett, A. H. Lockhart, James Maginn, W. Smith, L. Longbotham, F. Fensom, William Douglas, George Orr (the bicyclist), A. Trebble, Charles Doherty, Jr., and P. Clark. The eatables having been disposed of, a few toasts were proposed and responded to, and then, Mr. Lalor retiring from the chair in favor of Ald. Maughan, the most interesting part of the programme was carried out. This comprised some excellent solo and duet singing by Messrs. Humphreys, Lalor, Wilson, Wells, William Douglas and T. Carlyle, the last named accompanying himself on the bango, and also performed during the evening some exceedingly clever feats of legerdemain. Mr. Charles Doherty, Jr., was the accompanist, and favored the company with a capitally-played piano solo. The whole performance was thoroughly artistic, and much enjoyed by those who had the good fortune to be present. Indeed it was a revelation to the guests and to many of the members themselves, who had no idea there was so much talent in the club. Ald. Maughan, in winding up the proceedings, said that he thought that the "Owls" was almost a misnomer, and that the "Nightingales" would have been more appropriate, and he isn't far wrong. The Owls will have a shoot at Eglinton on election day, Feb. 22, when one of the events will be a match at 15 birds for $25 a side, between W. Dwyer and J. Maginn.

Jan. 22.—The Toronto Gun Club held a very successful shoot at the Woodbine this afternoon. Snowbirds were shot at, 20 to each man. Mr. A. Elliot won the first prize with 19 killed, Mr. Leroy coming next with 18. There were several 17s and 16s. In fact the shooting was particularly good all round. A large number of members were present.

Jan. 24.—A shoot took place at Eglinton to-day. The second sweep was at 9 blackbirds, three prizes. Score: W. Filstead, 9; J. Baillie, 7; S. Carruther, 7; W. McDowall, 7; T. Lowden, 5; A. Jewell, 4; R. Dickson, 4; J. Leroy, 4. Third sweep.—T. Lowden, 8; J. Baillie, 6; W. Filstead, 5; A. Jewell, 5; S. McKillop, 4; R. Dickson, 4; J. Leroy, 4; W. McDowall, 3. McKillop and Jewell shot a match at 6 birds, McKillop breaking 5, Jewell 3.

THE NEW ENGLAND TRAP SHOOT.—An extensive shotgun trap-shooting carnival is to take place on the grounds of the Wellington Gun Club, Wellington, Mass., May 30, 31, June 1, 2, 3 and 4, under the auspices of the New England Shooting Tournament Association. It will eclipse anything ever before attempted in the line of shooting with shotguns. It is hoped to have an international contest, and an invitation has been sent to England, requesting that country to send a reprcsentative team of ten men to meet an American team of the same number. In the shotgun

TORONTO, Jan. 27.—It is 16 years since a few thorough sportsmen met together and organized the Toronto Gun Club. From the first the enthusiasm was so great that the success of the organization was assured, but of late years the club has made great strides, and in spite of the organization of two or three other clubs in this city, the father of them all has gone onward and upward, until to-day it numbers no less than 150 active members. To-night the annual meeting of the Toronto Gun Club was held in the club rooms on King street. There were between 50 and 60 members present. The president, S. W. Downey, being in the chair. Business of a domestic nature occupied the club for two hours, during which reports were presented, showing the institution to be very flourishing, both in membership and financially. Then the election of officers took place with the following result: President, G. Pearsall; Vice-President, J. Wightman Millar; Secretary, J. E. Beswick; Treasurer, R. J. Kidd; Executive Committee, F. Martin, G. H. Briggs, A. Elliott and J. Worden; Auditors, J. C. Forman and J. Wright. Votes of thanks to Mr. Downey, who had occupied the presidential chair for three years, and other retiring officers closed the proceedings.

ON DIT.—A match is set down between L. B. Campbell, of Little Silver, N. J., and W. W. Leves, of Elizabeth, to shoot at 35 live birds each man, at Dunellen, Feb. 8, 2 P. M., for $100 a side; birds to be furnished by Campbell, 30yds. rise, 5 traps, dio to be thrown previous to each shot, one barrel, gun below elbow until bird is on the wing; boundary, back the club grounds as shown by the line of stakes; in all other cases the boundary is to be 1yd. from fence. $50 forfeit has been placed in the hands of Alfred Heritage. W. C. Budd and Wm. Graham, we are informed, are both entered for the big sweep for $100 per man at the tournament of the Middlesex Club, at Dunellen, Feb. 22, and a return match between these redoubtable shots similar to last match, is positively asserted. The match to take place on the grounds of the Jersey City Heights Gun Club at Marion, some time during the month. Also a match is being arranged between the Coney Island Rod and Gun Club and J. C. H., 15 or 20 men each club, 10 birds each; for the birds, glory and a good time.—JACOBSTAFF.

WELLINGTON, Mass., Jan. 29.—The Wellington Gun Club held its regular weekly shoot this afternoon, a goodly number of gunners being present to participate in the sport. In the medal match Shumway won in Class A, Wardwell in Class B, and Wilson in Class C. Following is the result of the other events: 1. Six blue rocks—Stanton and Moore first, Shumway, Snow and Schaefer second, Warren and Brown third, Sanborn and Wardwell fourth. 2. Six clay-pigeons—Shumway first, Warren and Moore second, Snow third, Wardwell and Short fourth. 3. Six clay-pigeons—Snow first, Sanborn second, Kimball third, Shumway fourth. 4. Six blue rocks—Shumway, Stanton and Sanborn first, Moore and Snow second, Wilson third, Schaefer fourth. 5. Six blue rocks—Swift and Moore first, Shumway and Ames second, Wardwell and Schaefer third, Warren fourth. 6. Six blue rocks—Stanton first, Snow second, Shumway third, Schaefer fourth. 7. Ten clay-pigeons—Swift first, Stanton second, McCoy and Wardwell third, Wilson fourth.

FITCHBURG, Mass.—The Fitchburg Rifle and Gun Club will hold a shooting tournament on its grounds Wednesday, Feb. 16. The principal event of the tournament will be the tenth competition for the climax diamond badge, now held by H. W. Eager, of Marlboro, a member of the Worcester Sportsman's Club. The events will be at artificial targets. All the principal shots of New England are expected to participate in the tournament.—G. W. WEYMOUTH, Sec'y.

MASSACHUSETTS RIFLE ASSOCIATION.—The third competition for the elegant gold badge in the Macomber badge shoot, will be held at Walnut Hill range, Wednesday, Feb. 9, at 10 o'clock, A. M.—J. E. LEACH, Sec'y.

EXTRACT from letter received by the U. S. Cartridge Co., Lowell, Mass., from Mr. Frank Hart, of J. Heart & Co., bankers, Doylestown, Pa., dated Jan. 21, 1887: "I have about come to the conclusion that your .22 short rim-fire cartridges are the most reliable in the market, and they are beginning to be appreciated by those who know where a bullet ought to go when they pull the trigger." —*Adv.*

Canoeing.

THE REGATTA PROGRAMME.

Editor Forest and Stream:

As the Regatta Committee have published their programme for the 1887 meet and have requested comment on same before its final adoption, I would inquire why they still keep the triangular course for all sailing events. It is admitted by all that the test of a boat's sailing qualities lies in windward work; but can you get windward work at all times with a triangular course? Take the trophy race at the 1886 meet as an example, the only windward work was one long leg and a short one; not enough by any means to test the sailing qualities of a canoe. Why not make the course 2 miles to windward or leeward and return? The starting line is stated to be 50ft. in length. This, I think is entirely too short, and to attempt to start 40 or more canoes across a line of this length would be an utter impossibility without numerous fouls, and even then the foremost boat to cross the line would be 100 and probably 200yds. ahead of the hindmost. As the first leg is to the windward the starting line could just as well be 500 as 50ft. and give all the canoes a more even start. A canoe starting from any point on the line would have exactly the same distance to travel to reach the windward buoy. This starting the canoes to windward, if the course is a true windward one, is a good move on the part of the committee, as it does away with jockeying for position and blanketing to a very great extent.

Our club expects to have a very good delegation at the next meet, even if we do have to travel 1,200 miles to reach it, and we are solid for a windward course and a starting line broad enough for all to get somewhere near an even start. MADELEINE.

JACKSONVILLE, Fla.

CANOE VS. SAILING BOATS.

Editor Forest and Stream:

Certain editorial remarks in your paper of Dec. 20, under the heading of "Canoes vs. Sailing Boats," are calculated to place me, at least, in a false position, and therefore I am forced to state that, while fully agreeing with you in regard to the excellence of square stern sailboats, sneakboxes and counter stern sharpies for various purposes, I do not now advise, nor have I ever advised, that anything but a canoe, as defined in t e first sentence of Rule I in the Sailing Regulations of the A. C. A., should be admitted to the privileges of the Association.

My proposition was and is, that a new class of canoes be admitted of sufficient beam to render them safe and comfortable under sail, and when managed by inexperienced persons who really take their lives in their hands every time they go sailing in a canoe 15ft. in length by say 28 to 31in. beam.

In other words, I insist that a canoe of the Association "must be sharp at both ends, with no counter stern or transom, and must be capable of being efficiently paddled by one man."

Now, I can efficiently paddle a canoe 48in. in width, but some men may not be able to do so. Therefore my suggestion was, and is, that a limit of beam in the proposed new class be fixed somewhere between 36in. and 48in., on a limit for say 15ft.

Further than this, I believe that no sailing canoe should be allowed in a race of the A. C. A., if her hull, including centerboard, weighs more than 140lbs., and no ballast should be used. Any canoe, of necessity, becomes a "sailing canoe" the moment a sail is hoisted over her.

Now, fellow members of the A. C. A., I beg of you to weigh this matter carefully, banishing from your minds mere personal feeling, and see if it would not be for the best interests of our Association to give us a new class with a little more beam.

Thirty-six inches would be a great gain in the direction of safety. Thirty-eight inches beam would insure us a fine comfortable little cruiser under sail, and an efficient paddler as well. Nobody desires to force you to give up your narrow boats, but we, the minority, would like to enjoy our kind of sailing without being regarded as outside the fence. Think it over, gentlemen.

ROSLYN, N. Y. THOMAS CLAPHAM.

Editor Forest and Stream:

I am in favor of wide canoes. I am building one. It will be 12ft. long, 90in. beam, perfectly flat flottom, perpendicular sides, 3in. deep amidships, 9 at bow and 7 at stern. She will be fitted with the Novelty Folding Centerboard (a new thing), 7sq. ft. immersed area, and will carry for cruising 150sq. ft. of sail. She will be an able paddler. True, she will be rather slow, but by running a plank out over the bow to sit astride of (ballast the stern to trim) and paddle *à la* Grant Edgar and sneakbox, she will go. She will be named the Stiletto. OMI.

A LIGHT CANADIAN CANOE.

Editor Forest and Stream:

Inquiries have appeared in some of your late issues respecting the value of canvas canoes for tramping and portaging. As one having considerable experience in such matters, allow me to place the result before our brethren of camp and rod. I have tried the canvas boat, and find it fairly light and easy to portage; but it requires too much care in the water for real comfort. Running rapids with it is out of the question, as a snag might be fatal to it; and on a long trip the canvas is apt to wear, to become soaked and heavy, and lose its paint and waterproof properties. Pretty much the same objections apply to a birch bark, though it is easier to mend, but is not quite so easy to carry. I have also tried a light skiff, 60lbs. weight, to carry and be carried by two; but for rough portaging it is very awkward, especially where the ground is rocky or much second growth prevails.

I heard great things of a composite canoe; wooden planks with canvas hinges, but it seems to have been more or less a disappointment. So last spring found me still searching for the desideratum, a craft light and handy enough to make portages a pleasure, and still enough to permit of casting a fly or landing a maskalonge, with strength enough to stand occasional rocks or snags and the wear and tear of protracted cruising. I write this for the benefit of brother campers, in the full belief that my search is ended successfully.

The Kyd, the present companion of my tramps, was built to order for me by the Ontario Canoe Company, of Peterborough. She is 11½ft. long, 28in. wide over all, and built of tongued and grooved cedar strips, 1in. wide and 3-16in. thick. She is decked in 3½ft. bow and 3ft. stern, and has a 2in. coaming around the well. The decking is of very thin cedar, the coaming of hard wood. With two tin air tanks 2ft. long in each end, she only weighs 30lbs., and is easy to portage either on the head or by slings around the shoulder. Her strength is immense, and owing to her peculiar construction she has never leaked a drop, and will not short of actual smash of the sides. Her width and flat bottom render her very steady, and she has proved herself quite equal to the swells on Lake Ontario. One word more in her favor, she was cheap; a big matter when connected with success in other particulars. By using oiled linen decking and omitting the air tanks, her weight might be still further reduced.

I trust that this may be the means of robbing the portage of its terrors for many an outer, and of making it, as it ought to be, a pleasant change from the *far niente* of the camp. OLD RUG.

A CANVAS CANOE.

Editor Forest and Stream:

Some time ago I saw in the columns of your entertaining paper an inquiry relative to canvas canoes. Having built one several years since and used it continually from the time it was finished until the present, the following may benefit the inquirer and others:

If I remember rightly I gleaned my information as to model and details of building from an article written by Mr. Stephens in the *Scientific American*; at least it was in the winter of 1880-81 that the boat was built and launched about May 1, 1881. The size of the boat was 12½ft.x36in., 12in. deep amidships and 16in. at stem and stern, and it was built as follows: The keel was a piece of white oak 1in. square by 11ft. long, fastened by screws to the stem and stern pieces of hackmatack, cut so as to be 1in. thick where they were fastened to the keel, and shaved to less than a quarter of an inch where they cut the water and above, and curved so as to make just 12ft. length of boat over all. A single mould 36in. long, 12in. deep, set crosswise in the center of the keel and fastened securely, served to give the proper sheer plan and shape, to which was tacked the middle of two strips of white oak, 1x¼in., the ends of the latter being then bent around to the stem and stern pieces, which had, of course, also been securely braced after being screwed in place and made plumb. Of these thin oak strips I had provided a dozen, six for each side, and they were fastened to the ends by small brass screws below the waterline, and iron above. After the first two were on, however, running from the top of the mould in the center to the top of stem and stern, and making a beautiful sheer, I placed in the ribs.

These were made from some rock elm, two pieces of which I bought from a wagon maker for fifty cents, they being, when I bought them, 6ft. long, ¾in. thick and 3in. wide. With a rip saw I cut them into nine or ten pieces, each ¾in. wide, ¼in. thick and 6ft. long. I then marked out on a large sheet of white blotting paper, about 2ft. square, used on office desks, the shape of what I considered the rib should be, beginning at the center ribs and making the ribs aft and forward of the mould in the center alike. After they were marked out on the paper I cut them out with a pair of shears, laid them on a wide board, drew the plan of them on that, and then drove nails 3in. apart down the line on the board, one on each side, from the top to bottom of the rib plan. Then having steamed the elm strips in a wooden box or trough 4in. square and 6ft. long, made for the purpose, into which I inserted the spout of a common tea kettle through a hole bored in the center of the bottom, when resting on the backs of two chairs I bent the elm nicely around between the projecting nails along the line or plan of the rib drawn on the board, making a pair of each, each rib reaching from gunwale to gunwale, all in one piece.

I then mortised holes through the keel from one side to the other ¼ by ¾in. wide, just large enough to allow the rib to go through, tight fit, and 6in. apart. Through these holes I inserted the ribs, each in its place, fastening the same in the center, through the keel with a brass screw ¾in. long, and at the sides to the gunwale by an iron screw ½in. long, ribs outside of gunwale. I now ran another oak strip from stem to stern, outside of ribs, fastening that to inside wale by copper wire running through each and around the end of each rib, so as to bind all together firmly. One foot from each end I put in a pine bulkhead, made of ½in. stuff, flush with the ribs. Having fastened everything securely I now took the frames from off the stocks, leaving the mould in frame, however, in the center, and turned it over, bracing it in the center and at the ends, and put on the balance of my oak strips, spacing them about 4in. apart, running from stem to stern and each screwed to the ribs where they crossed each other.

The directions then said to stretch on the canvas, to paint and the boat is finished, but preferring strength to lightness I procured from the planing mill some light stuff they had stored away composed of butternut, pine and some walnut, not over ⅛in. thick; this I fastened to the bottom in strips of about 4in. wide, narrowed at ends so as to fill the spaces between the oak strips, and in such a way as to make a smooth bottom. Not water-tight, of course, but smooth enough to act as a foundation for the canvas, and extending about 3in. above waterline. This I then painted with thick white lead, then took my canvas, two widths sewed with double seam up the center, 12ft. long, being then wide enough to reach round the bottom from gunwale to gunwale, tacked the seam down the keel, drew the sides down to the gunwales (she was upside down), fastened them lightly, then drew them out at stem and stern very tight, fastened it there, turned her over, drew up and fastened canvas over gunwales, and in such a way that I got the most perfect set of waterlines you ever saw, using small copper tacks; put bottom boards inside, decks from stem and stern to bulkheads, rowlocks, etc., two coats of white lead outside, and she was done. Total cost $4.35.

I have used the boat every week of every month during the summer time since, and for two years every day almost without exception during the summer months, and that, too, the very roughest kind of usage, around the city docks, up and down from dock to water and over logs and rafts until I thought at times she was surely a goner, but to-day she is just as good as the day she was launched, with the exception of a few scars in the canvas where I have tacked and painted over slits made by sharp sticks and nails. She draws only 2in., light, has, of course, a very flat floor, sails well only before the wind, runs like a zephyr with oars and works beautifully with double paddle; but, more than all, will hold a man upright without dumping him over one side when he happens to look over the other side. I have again and again taken four, five and six persons down the river to Saginaw Bay in her and then had 6 and 7in. of freeboard; and although we could not travel around her deck much, she was as steady as a church, weighs but 60lbs., and the older she gets the tighter she becomes. I have been induced by Mr. Bousfield, of this city, who so beautifully carried away the first honors last year at the A. C. A. meet for the highest average record of points in racing, to buy a canoe, and have now building a smoothskin 15ft.x31½in. canoe by a local builder, but in spite of the fact that I promise myself a good time in her, and lots of sport and excitement at the meets, which I shall try and attend, I am inclined to believe that when I want a good time and desire to take a chum or two for a sail or fishing excursion, without fear of capsizing, and wish to take comfort, that I shall have to leave the new boat at home and fall back on my old canvas-back.

I must say that I heartily agree with Mr. Clapham in this matter, and believe that instead of ballast and racing machines, a wider, safer, more comfortable boat is far to be preferred.

BAY CITY, Mich., Jan. 23. N. C. HARTINGH.

CANOEING IN ILLINOIS—Peoria, Ill., has several canoeists, and a club will probably be organized in the spring. The Illinois River offers good sailing, paddling and camping, with plenty of fish and game.

THE A. C. A. AND UNATTACHED CANOEISTS.—Belleville, N. Y.—"Mac" asks in your issue of the 20th ult. why only 10 per cent. of the Passaic River canoeists are A. C. A. men, and why all do not join, attend the meets and there urge a salt-water meet. In the first place I believe only three of the above members have ever attended any of the meets and the supposition is, if the whole number of canoeists should join, as few in proportion could attend and they certainly would have no more influence in locating the meets than the members of the three large New York clubs who are not twenty miles away. The trouble is the canoeists cannot attend the distant meets and so do not care to join. We do not ask to have the principal meet here every year; simply to have one near New York city, to warm up the luke-warm and bring in the outsiders and then we will be better able to take care of ourselves. There being no camp to attend within reach a great many cannot make up their minds to start for a cruise with nowhere definite to go to, and never starting do not know how much they miss. If they had something to start them they would probably make good cruisers. Of course there are a number of exceptions to the above, some take long cruises, notably one who cruised to Newport, R. I.; one who cruised nearly the whole length of Long Island Sound in a canoe built by himself; another who ran the Delaware and a number who have gone to Sandy Hook. But even to such the A. C. A. is of very little practical benefit. For instance I cruise whenever I have a few days and every vacation is spent that way. I have not been able to attend any of the meets (and I doubt if I could this year, even if it was close at hand), and although I joined before my first canoe was finished, some three years ago, I have never derived the least benefit, nor seen the least advantage in being a member, with the exception of the satisfaction I have had in knowing I belonged to a first-class organization of good fellows and flying their flag and the hope of some day attending a meet and making the acquaintance of those whom, thanks to your good paper, already seem like old friends. To me this is worth the $2, but the great majority do not look at it in that way and don't like to pay for what they have no hope of ever getting.—IDLEMERE.

CANOE BUILDING AT CANTON.—Mr. Rushton has been busy at his extensive shops throughout the winter preparing for a large trade in the spring. He has sold few canoes, but several sneak boxes and cruisers for the South. The new catalogue is now partly completed, but will not be ready until March. The latest novelty in the way of canoes is the new smooth lap, two samples of which, a Vesper and Bucktail, are now on exhibition at Squires, in New York. The edges of the plank are each beveled, so that the lap is flush inside and out. The new Vesper is a far handsomer and fairer boat than any of the lapstreaks of the same model, and both she and the Bucktail are no heavier than if built in the usual way. A novelty that we cannot commend is a sliding seat, a frame across the canoe on which slides a deck seat on which the crew may sit far to windward. In brasswork Mr. Rushton has lately got out a very handy little hook for a tent, small and compactly made. The upper end is driven up under the gunwale and the lower is held by a single screw. Another neat fitting is a snatch block of a new pattern.

OAKLAND C. C.—The annual meeting was held on Jan. 15, the officers elected being, Commodore, W. W. Blow; Vice-Com., A. D. Harrison; Secretary, E. R. Cooper; Treasurer, F. W. Tallant. The fleet now numbers 22 active members and 18 canoes, with four more building. On Jan. 16 a race was sailed for the Mayrisch gold badge, seven boats starting. The wind was light and variable from N. E. The summary was as follows: Sailing race, first class; prize, Mayrisch gold challenge badge. Tide high at 5:15 P. M., wind light easterly. Regular club course, three miles:

	Start.	Turn.	Finish.	Time.	Dif.
Mystic	3:40	1	4:54	1:14	...
Echo	3:40	2	4:54:15	1:14:15	15s.
Coney Island	3:40	4	4:57	1:17	3m.
Zoe Mou	3:40	5	4:59	1:19	5m.
Sampler	3:40	6	5:00	1:20	6m.
Shadow	3:40	3	5:04	1:24	10m.
Flirt	3:40		Did not turn the stake.		

ARLINGTON C. C.—*Editor Forest and Stream:* The first annual meeting of the Arlington C. C., of Arlington, N. J., was held Jan. 4, 1887. C. V. Schuyler was elected Commodore; Richard G. Molloy, Vice-Commodore, and Irving V. Dorland, Secretary-Treasurer for the ensuing year. The reports of Secretary and Treasurer show a membership of nine, eight of whom own canoes and are active canoeists; a boat house built and paid for, and the club out of debt, which we think a good showing for our first year.—IRVING V. DORLAND, Sec.-Treas.

HARTFORD C. C.—The annual meeting of the Hartford C. C. was held on Jan. 18, the following officers being elected: President, Dr. Geo. L. Parmele; Commodore, L. Q. Jones; Treasurer, W. B. Davidson; Secretary, John D. Parker; member of Executive Committee, W. G. Abbott. The Treasurer's report showed a good balance and it was voted to call in four of the house bonds, choosing them by lot. The first camp-fire will be held shortly.

THE A. C. A. AND THE W. C. A.—Albany, N. Y., Jan. 28.—*Editor Forest and Stream:* Your compositor in putting into print my letter in last issue, made the words "rectification of errors" read "ratification of errors." There is a slight difference between these two expressions.—R. W. GIBSON.

KNICKERBOCKER C. C.—The officers of the K. C. C. elected on Jan. 13, are: Commodore, Henry Stantou; Vice-Commodore, E. W. Brown; Secretary, E. C. Griffin, 54 and 56 Duane street, New York; Treasurer, M. G. Foster; Measurer, A. S. Gardner.

Yachting.

Address all communications to the Forest and Stream Pub. Co.

YACHTING AS A NATIONAL SPORT.

AMONG all sports the foremost place has long been conceded to yachting, as the one best calculated to develop a strong and hardy people, and to encourage that love of maritime pursuits that is the most efficient safeguard of a nation. Situated as the United States is, with an ocean on each side and great bodies of water to the north and south, to say nothing of the immense inland water courses; its maritime interests are of the most vital importance. The part which a pleasure navy may play in the development and building up of a merchant marine and of a national navy is generally admitted, and yet it is beyond question that American yachting, in spite of its many grand achievements, is far from being thoroughly national in its character. However successful its growth, it has been uneven and local, and the day is yet distant when yachting, throughout the length and breadth of the country, will be under an intelligent and competent governing power that will direct its growth from a national point of view, in place of the isolated and independent efforts of the various clubs. England and America have thus far stood together as the two great yachting nations, and this statement is true to a great extent of both. In France yachting has never attained the popularity that it has in the other two countries, and it is not surprising that its condition is still more unsettled and chaotic.

For some years past our contemporary, *Le Yacht*, has been doing good work in the building up of a better spirit, and in furtherance of the same effort it makes the following strong appeal, written by a French yachtsman, which we translate from its columns. It is interesting as showing the efforts that a friendly rival is making, but still further it is of value in that it applies almost as directly to American as to French yachtsmen. Its lesson is broad and general, not limited nor local; learn from all, most of all from the most dangerous rival, but choose or reject intelligently and without prejudice, keeping in full view the whole field of yachting and not the temporary advancement of any one branch at the expense of the general good. Foremost in this work must be the creation of a national type, a vessel that shall embody in the highest degree the three requisites of safety, speed and accommodation, and that shall be suited to all the requirements of American waters and conditions. Not that any one vessel can combine many contradictory qualities, but that the typical yacht shall be based on sound and correct principles, its details of keel or board, of depth and beam, being modified within safe limits to the special conditions of each case.

Unlike France, the United States has possessed a distinctively national type of yacht, a type which we are glad to say has practically passed away, leaving a condition of affairs somewhat similar to that in France, where the fleet is made up of all varieties, from the modern keel mine to the extreme skimming dish. It is this state of affairs, the confusion and uncertainty that follows every revolution, that is responsible for the lack of entries in American races to-day, as well as for the very small number of yachts building in spite of the strong and general interest in yachting that prevails throughout the country. Not until the present confusion has given way to a more settled condition can any great increase in the entries of existing boats be expected; nor can yachtsmen set to work earnestly to replace the ancie racing fleet by a newer and far better one.

The FOREST AND STREAM has opposed the ancient sloop from a belief, now generally acknowledged, that it was founded on utterly false principles; and on the other hand we have fought for the modern cutter because whatever modifications may have arisen from measurement rules or other local considerations, the model and rig have been based on sound and safe principles. Thus far we have seen the cutters increase while their adversaries have abandoned the field entirely. Now the question is between the cutters pure and simple and the new compromises, but even the final result of this may not settle entirely the question of the future type. Certainly the cutter has been proved to possess in a higher degree than any of her rivals the three essentials of safety, speed and accommodation, and we do not anticipate that future races with the compromises will prove anything to the contrary. If they do not the remaining question is, what class of cutter is best adapted to American wants, four beams, five beams, or six beams, and what can be done to improve still further the best existing boats. This is the task that we believe is ahead of American yachtsmen, and we can only hope that they will address themselves to it in the same liberal and patriotic spirit that is displayed throughout the following:

Should we, as far as it concerns yachting, be English, American or simply French? This is the question placed now more directly than ever before French yachtsmen. For some years they have discussed without end the various nautical questions; they have experimented; they have written; they have bought abroad, and they have built at home all the various types of yachts; and yet the end is not reached. Truly, it is pitiful to see the compatriots of Sauvage, of Papin, of Depuy De Lome, who possess still on their side engineers and seamen of the first order, completely eclipsed by the names of Englishmen or Americans, whose works are loudly extolled by their admirers.

Certainly it is praiseworthy to be able to recognize the qualities of one's adversaries; it is even of the greatest utility from a practical point of view; but to carry this admiration to the extreme of annihilation and distrust of oneself is a deplorable thing. Without discrediting the English and American yachts, are there not grounds on which to base a national claim in favor of French yachts, past, present and to come? Have we not amateurs, builders and sailors, capable of creating yachts to navigate our waters and about our coasts, to satisfy conditions that are neither those of England nor of America? Naval architecture is as much our property as that of other nations; neither the forms, the rigs nor the total of qualities which contribute to good construction are the sole privilege of any one country. The French corsairs were the first to have lead in their keel; the United States did not exist when France first had centerboard boats. When English regattas were still unknown the cutter-rigged vessel plowed our seas. This does not contradict the fact that the cutter rig and the lead keel seem to be the peculiar attribute of England and the centerboard a special appliance of Americans; but it proves to us that we are wrong to follow contentedly the footsteps of others in naval construction.

The excellence of our small yachts goes far to protest and to show that we know what fast boats are; we have the technical treatises on navigation and construction, we have the books that enlighten us upon all questions of surface friction, of displacement, of speed, etc.; they are less special to yachting if it is true than English publications, but to adapt them to our sports it is only necessary to make one step. If our engineers are called on to construct yachts, why will they not make them as good as our torpedo boats and our cruisers, in which classes they have never yet found their masters? And if, on the other hand, an experienced and practical amateur produces a yacht from his own design, why not accord to him the credit which foreign amateurs receive?

We have had the energy to shake off the English yoke which weighed so heavily on our yachting in the question of measurement. The new formula has now been tried for a year. If it is not perfect it is perhaps justly entitled to consideration as an excellent middle course, and if one considers that it leaves us full liberty of action, there is room for sincere rejoicing. The time has come, then, to live a life of our own and it is for us to show whether or not we are capable of constructing yachts. After this preamble, inspired by a sentiment of national self respect that all doubtless will approve of, we will endeavor to demonstrate that we can without fear throw aside the English vessel, guard ourselves from an American invasion and provide ourselves with yachts from our own workshops.

While the prestige of the English yacht has been strongly assailed of late by the successive victories of Puritan and Mayflower, it occupies still a very important place in French yachting, its apostles are still very numerous, so that it will not be superfluous to return once more to this well-worn subject. The modern English yacht is a marvel, let us commence by recognizing that it is a marvel of naval science, as well as over the regatta courses. The starting point being given, the English have chosen a most advantageous course, and have accomplished the great feat of converting a bad beginning into a successful ending. But this ingenious expedient, invented to meet the requirements of a certain fixed case, while warding off or strongly defending against assaults from without, was likely to fail some time, when exposed to unforeseen tests. The contest that has lately been lost on the other side of the Atlantic has proved this. The English have been punished in their weakest spot; their exclusiveness has operated to close their eyes and their despotic rules have little by little brought the English yacht to such a condition as a special machine, that it has, by its weakness abroad, made some amends for its faults in principles.

Here then is a first and serious rebuff. The English have written in enormous letters, Puritan, 140 tons Y. R. A. and put beside it Genesta, 80 tons; they deceive neither themselves nor any one else; the two yachts were practically equal in size, being almost the same length and of the same power. To pretend that Puritan is much larger than Genesta is as great an error as to say that the latter is larger than her rival because she displaces 43 tons more. Standing aside from any special or prejudiced point of view, one can see that the battle was fought with equal arms, and one must imagine a great simplicity on the part of the combatants to believe either capable of facing the combat with the knowledge that they labored under any real disadvantage. On the coast of America the English have experienced a second disappointment, and the blow has been so much heavier in that they had prepared for a long time for the strife, and believed themselves sure of victory, even though following their deplorable system of protection and ostracism in yachting, and in deforming their yachts in order to further perfect them. Without, however, placing France on a footing of equality, while unfortunately it is not yet possible to show our flag in the grand records and in international regattas, we can assert that the English yachts suffer strongly from the pressure of a measurement that no longer favors them. Our neighbors and ourselves were used to seeing yachts of a power double to ours enter in our regattas and cover themselves with easily won laurels. Such a yacht, out-classed in England, came to France and found itself in the first rank. Small or large, racer or cruiser, the English yacht profited enormously by this measurement. What has been the result? Yachts were purchased on the other side of the Channel, but the anglomaniacs met with a certain deception, and it is necessary to believe that the non-entrance of English in the Havre regatta is a consequence of a new state of things. We may now commence to hope that French construction can in its turn take a place and play an important part. As we have said before, the proof is found in the small yachts. In the smaller classes the English boats have had numerous defeats. Unfortunately the records have been neglected, and the small size of the yachts tends to make them forgotten.

It would be tedious to recount against the English yachts all the criticisms, well or ill founded, that have been made against them; but it will be difficult in an article destined to rehabilitate ever so little our national yachting, to pass in silence their unanifest defects. The perfected type of English yachts, the modern racer, has first the grave fault of being extremely costly; the second and no less serious is that it is ill adapted to the navigation of our coasts; it draws too much water. There remains the third and principal question which includes speed and seagoing qualities. As to speed we cannot now say. The Americans have proved that the English have not always the advantage on this point. But as to seagoing qualities we do not overstate the matter in saying that they could be improved. It has been well said that at times the English craft sail under the water, for us is necessary a model that will raise itself over the wave, and we have the choice among those of our coast. Let us hasten here to acknowledge that we do not speak now of English construction. Its qualities have been proved often enough, and we would not depreciate them. Here, also, while criticising, let us render due praise to the perseverance and the high qualities as mariners of the English nation which has carried yachting to the highest point of development it has yet attained. But we are of the opinion that, though there is much for us to learn from them, we are not obliged to copy the types which they have created, excellent on certain portions of the English coast, but not adapted to ours. The praise which we have accorded to the maritime science of the English people we give equally to the Americans. But when it concerns the decision as to what sort of construction is best adapted to our coasts, it is necessary to guard ourselves as well against one nation as against the other. In effect it cannot be too often repeated, each country has its special needs and navigation, and the types which it creates should, above all, satisfy the requirements imposed by the general configuration of its seacoasts. The American seaboard, more sheltered in general, dotted with low coasts, with large rivers and with numerous small streams, compelling a special navigation, has from the first dictated a type with small draft of water, with or without a centerboard. The result of this state of things has been naturally to lead the American yachtsmen to build vessels of a limited draft of water and of great beam, those which they distinguish by the name of sloops. All familiar with yachting know entirely or in part the history of the sloop and of the beamy American boats. I will confine myself, then, to a consideration of what are the good qualities and defects of the American yacht, and her actual influence on French yachting.

While the American type has succeeded in the recent strife in scoring a brilliant victory over the English type, how does it happen that the American yachts imported into France have not attained here the prestige of their rivals? There are several reasons. The first is that the measurement does not favor them; the second is, that we have better boats to oppose to them in the classes where we are not disarmed for the many reasons which I have enumerated above. The third is that they were not in the fashion; for there is a fashion in navigation as in all other things.

Let us say here, the true American racing sloop, such as she was once known in principle, has been almost abandoned; they have at last recognized that she was too wide, too shallow, too heavily rigged, too dangerous, defective in many of the points of her construction and rig; and the Americans, to retain a trophy acquired in the days of racing schooners, in the time when England had not yet evolved her favorite champion, have not resolved before the most radical modifications, have not hesitated to borrow from the enemies themselves the necessary lines for defense. This tardy awakening, however, has not brought about a radical modification of the type; the principle remains the same, the American yacht is still wide and relatively shoal, but it has benefitted enormously by the knowledge acquired by experience, which in this case is not confounded with routine. If then we consider the American yacht from the point of view of her relation to French yachting we find the following material facts: First, that the old type, to-day entirely neglected, has never attained a wide popularity in France; we speak, be it understood, of the seagoing class of vessel. Second, that foreign modifications have made the present type far superior to its predecessors. It is difficult then to say what should be understood by a national type.

But on leaving aside this question we may fairly ask whether the so-called American type is really that best adapted to our uses. Putting apart the question of speed in the absence of any definite solution, does the shoal centerboard boat represent the perfect racing and cruising yacht for French waters? Assuredly no. No more than the English cutter. If it has the advantage over the latter of being beached without any great inconvenience, and of navigating in shoal water (provided it is not necesearv to use the board), it does not answer to all that we should demand in a yacht, neither in its rig nor in its form. It is not necessary to deceive ourselves, our seacoast is difficult, the sea is heavy and the waves have a long sweep. A vessel carrying a large sail plan and not easily handled, low on the water, of light draft, of light displacement, of limited stability in spite of an exaggerated breadth, such as the pure American type, never can take our yards, and the question of speed (a most important consideration for a yacht) being from the first reserved, we are justified naturally in disregarding the American type as we have disregarded the English. I know that an objection will be made in behalf of the names today so famous, the Puritan and the Mayflower; but, I repeat, these vessels are no more than compromises in which the primitive type has been modified, and the principles underlying their design are no more American than English. The question then is greatly simplified, and, in conclusion, we can say that it is necessary to copy neither American nor English. Whether our yachts should be keel or centerboard matters little. If for open water we build keel vessels they need be no more English than those centerboard boats which we build for our rivers and bays, or the sheltered waters of certain parts of our coasts, need be American. As I have said above, yachts are derived from other marine types born in the regions where they are built. Our fishing boats, our pilot boats (without speaking of our ships, which less closely resemble the yachts by their form and their requirements) are they of a type at once original and national? Yes, certainly, and is this type the best? Yes, beyond question. Our cutters of the channel, our chaloupes of the Gulf, our Breton sardine boats, our Provençal tartanes, need fear nothing from the similar boats of other countries; quite to the contrary. These vessels give constant proof of speed and of marvelous endurance, especially when one considers the primitive means at the disposal of their builders. Now, take one of these excellent models as they abound in our working vessels, lengthen the waterlines of the bow, according to modern ideas, add a graceful stern in harmony with the elegance of a yacht, employ all the refinements of modern building, such as lead, sail, etc., and I am certain we will have the essential of an excellent yacht. A priori, we can easily understand that we have nothing to gain in choosing between two types equally exaggerated. The truth should be found in a happy medium and we will have no cause to seek inspiration solely from abroad.

I believe that in France we can construct good and beautiful yachts; I believe we can aspire to our complete independence, and this conviction is founded on the fact that France is a great maritime nation, that she had a glorious past and that at the present time she is lacking neither in engineers nor constructors capable of designing and constructing yachts that shall be worthy of carrying the national flag with honor.

ELECTIONS AND MEETINGS.

Bunker Hill Y. C.—Jan. 26.—Commodore, George T. D. Wilcox; Vice-Commodore, I. Henry Porter; Fleet Captain, W. H. Webber; Secretary and Treasurer, B. F. Underhill, Jr.; Financial Secretary, George W. Abbott; Trustees, W. H. Tolman, J. W. Rich, George H. Barrows.

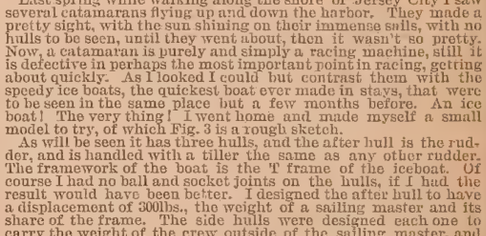
Cooper's Point Corinthian Y.C.—Commodore, H. Clay Funk; Vice-Commodore, Wm. Cook; Rear-Commodore, Theodore M. Jones; President, John Denis; Vice-President, C. W. Oswald; Secretary, A. B. Mutchler; Treasurer, C. H. Anderson; Measurer, Henry F. Walbridge; Trustees, John Denis, A. B. Mutchler, C. H. Anderson, H. Clay Funk, Charles Allgaier; Regatta Committee, H. Clay Funk, Wm. G. Cook, The. M. Jones, C. Anderson, C. W. Oswald, J. Denis, H. F. Walbridge; C. Clark Thorman was elected Captain by the Board of Examiners.

Boston Y. C.—The twenty-first annual meeting of this, the oldest yachting organization east of New York city, was held at the Parker House, Boston, Mass., on Jan. 26, Commodore Jacob Pfaff presiding. The election of officers for the ensuing year resulted as follows: Commodore, Augustus Russ; Vice-Commodore, J. B. Meer; Rear-Commodore, J. P. Phinney; Secretary, Thomas Dean; Treasurer, D. A. Dorr; Measurers, D. J. Fowler, J. B. Smith; Trustees, Benjamin Dean, Thomas Manning, Eben Denton; Regatta Committee, J. H. Stetson, J. P. Phinney, L. S. Jorden, G. R. Howe, W. L. Welman; Membership Committee, J. B. Meer, Alfred Mitchell, E. H. Tarbell. Mr. Pfaff, on resigning the chair to the commodore-elect, spoke feelingly and regretfully of the necessity he was under of severing his official connection with his fellow members, and Commodore Russ, who was the leader of the founders of the club twenty-one years ago, reviewed the pleasant and harmonious progress of the organization in a very interesting manner, concluding with an impressive eulogy on the energy and ability displayed by Commodore Benj. Dean, when a few years back the club passed through the only critical period which it had experienced since its foundation. The treasurer's report, which showed the club to be in an exceedingly flourishing condition, was read and accepted. A preliminary appropriation of $600 to the Regatta Committee was passed, and the business portion of the meeting was terminated with a unanimous vote of thanks to the retiring officers.

THE SCHOONER YACHT HELEN.—Philadelphia, Jan. 20.—*Editor Forest and Stream:* The schooner yacht Helen, of Philadelphia, owned by me, arrived in the St. John's River, Florida, Jan. 13, I will return to her in a short time, when she will sail for Havanna. Her grounding in Core Sound, as reported in your paper of Dec. 30, 1886, was caused by misplaced buoys and extremely low water, and as she was perfectly land-locked, she received no injuries whatever. All yachts of any draft of water going through Core Sound this fall and winter have had the same trouble on account of the buoys, and if they are not placed in their proper positions some one will come in there in a hurry some time and get wet. —CHAS. D. MIDDLETON.

YACHTING NOTES.—Wanderer, schooner, is fitting out at New Bedford for a cruise to Bermuda and Barbadoes....Minitaga, steam yacht, is at Tebo's pier, for a new engine and alterations to cabin. A steam launch is also building at the same place, of 50ft. L. W. L., 8ft. beam, 4ft. hold and 3ft. draft. She will have a triple expansion engine, 4, 6 and 10½in. by 8, with a coil boiler. Her wheel is 38in. The boat is for Messrs. Boyer and is intended for speed....At East Boston Martin is at work on a 23ft. cutter for Mr. Cummings, of Woburn, Mass.

BOSTON YACHT AGENCY.—Messrs. Clark & Co. write us that the present edition of their catalogue is exhausted, but that a new and larger one will be ready by Feb. 15.



YACHT STOVES AND CATAMARANS.

Editor Forest and Stream:

The cold weather naturally brings the stove question to mind once more, so I send you drawings of a stove I had made for my 27ft. cabin yacht last spring. Fig. 1. is a small stove, it weighs 7lbs. and is built of cast iron, holding over a gallon of gasoline. Two gallons of gasoline was all we used on a week's cruise for a party of three. A is the reservoir, B is the bulb pump for compressing the air which forces the gasoline up the syphon shown in the center; into the burner C is the air nozzle. By opening this in case of any accident the air escapes, the gasoline flows back to the reservoir and the light goes out. An explosion is impossible, because air cannot get to the gasoline and thus no vapor can be formed. D is a layer of asbestos, which keeps the heat of the burner away from the reservoir and absorbs any leakage. E is the needle valve which regulates flame from the size of a pinhead to one that will boil a tincupful of water in three to four minutes. F is the bail to carry it with. Near F can be seen the hole for filling reservoir. Should any one be foolish enough to try to fill it while the stove is lit, the flame will be instantly extinguished. I use a drum over the stove for heating. We were out sailing Nov. 28, and this stove kept the cabin warm and comfortable. We do not lay up until the river freezes over, and will be out again March 1, so you see we needed the drum.

The old stove was not satisfactory because the burner was defective and once in a while it would blacken everything up; the new stove has never made a grain of soot. As I am the proud possessor of a 42ft. cabin sloop I set my brains to work to make a large stove suitable for the parties that go in her occasionally, with the result shown in Fig. 2. I bought a dismantled three-burner gasoline stove, old style, with overhead reservoir (too dangerous around a boat). I detached the reservoir, took off the burner and top from my old stove and connected them with a globe valve, D. The reservoir holds about six quarts of gasoline, it is pumped up as in Fig. 1, but is burned through the three burners, E E E, either or all of which can be burned at will, and leakage of oil or food is caught in pan, F, and cannot possibly reach any wood work. This is the handiest stove I ever had anything to do with, and my wife uses it as well as I. Both these stoves are entirely original according to the best of my belief, and in my opinion superior to any other that can be made for yacht work.

Last spring while walking along the shore of Jersey City I saw several catamarans flying up and down the harbor. They made a pretty sight, with the sun shining on their immense sails, with no hulls to be seen, until they went about, then it wasn't so pretty. Now, a catamaran is purely and simply a racing machine, still it is defective in perhaps the most important point in racing, getting about quickly. As I looked I could but contrast them with the speedy ice boats, the quickest boat ever made in stays, that were to be seen in the same place but a few months before. An ice boat! The very thing! I went home and made myself a small model to try, of which Fig. 3 is a rough sketch.

As will be seen it has three hulls, and the after hull is the rudder, and is handled with a tiller the same as any other rudder. The framework of the boat is the T frame of the iceboat. Of course I had no ball and socket joints on the hulls, if I had the result would have been better. I designed the after hull to have a displacement of 300lbs., the weight of a sailing master and its share of the frame. The side hulls were designed each one to carry the weight of the crew outside of the sailing master, and the whole weight of frame and rigging. I used cat-rig because it is the most effective, and if you build a racing machine you want it to go.

As my model was too small for a crew I laid greased ways across the forward plank and hauled a box of cobblestones from one side to the other with a tackle from each side. Perhaps if she had not gone about so quick that box would not have gone over, but I am not amphibious and I don't like racing machines anyway. Some one else, perhaps, can make it work better than I could.

I am through experimenting with it, but I cannot help thinking that there is some merit in the idea, especially for those who like racing machines. From the crude tests I was able to make her head resistance was but little more than an ordinary catamaran, while the three hulls presented greater resistance to leeway, and she went about considerably quicker than I wanted.

All in all I believe with a full crew and a boat built large enough to carry them, a boat of this kind will beat a catamaran largely on windward work. Going free the catamaran would have a slight advantage. CHAS. L. WORK.

PHILADELPHIA, Pa.

ICEYACHTING.—On Jan. 28, the Orange Lake I. Y. C. sailed its first race this season over a 10 mile course for the champion pennant presented by Messrs. Beggs and Moore. The entries were Snowdrift, H. C. Higginson; Impulse, J. B. Miller; Cold Wave, Willett Kidd; Alert, Geo. S. Trimble; Esquimau, H. S. Ramsdell; Helen, F. G. Woods. The wind was S.W., blowing very hard and Helen and Esquimau were disabled before the start. Snowdrift won in 83m. 12½s., with Alert second and Cold Wave third.

At last the long-looked for race for the challenge pennant of the Poughkeepsie I. Y. C. has been sailed, the winner being the new Reindeer, built and sailed by Mr. J. Buckout. The race was set for Feb 2, but the prospects of a storm caused it to be called on the previous day by the committee, Messrs. Johnson, Booth and Van Kleck, and at 3:44 P. M. a start was made over a 12 mile course, two rounds. The starters were Bessie, N. P. Rogers; Reindeer, owned by George Bech; Jack Frost, Archibald Rogers; Icicle, J. A. Roosevelt; Scud, J. B. Weaver; Northern Light, J. H. Barron; Great Scott, E. H. Sanford; Gracie, Louis Edwards; Haze, Richard Knight; Jessie B., Charles Lamb. The wind was strong from the north throughout the race. Reindeer led from the start, winning easily. The times were: Reindeer, 1.5.40; Northern Light, 1.9.50; Bessie, 1.12.00; Scud, 1.12.40. Haze parted her bobstay and withdrew. Several minor races were held at other points on the river, reports of which have not yet been received. The race for the Challenge Pennant of America was set for Feb. 3, but the snow will probably cause a further postponement.

THE "FIELD" ON THE GREAT "REPORTERS' SWEEPSTAKES."—The report that the Royal Thames Yacht Club intended to offer 1,000 guineas for "an ocean" race open to all the world was telegraphed to America, and forthwith an ubiquitous *Herald* reporter was instructed to find out what the "ocean match" meant. He naturally first waited on Mr. Beavor-Webb, who by this time has learnt pretty accurately the sort of news the newspapers like when the direction of public expectation is known. Mr. Webb thus humorously tickled the ears of the reporter: "The race offered by the Royal Thames Yacht Club has been thought of for some little time past. This matter has been well considered by the English yachtsmen, and it is intended to test the staunchness and the seagoing qualities of the competing yachts, as well as their speed. Seamanship and skill in navigation is also to be tested, for the course will be from the Nore across the Atlantic Ocean, out to and around Sandy Hook Lightship, and return, a distance of about 6,000 mile. You may depend upon it that this is the intended course."—*Field, Jan. 15.*

A CRUISE OF THE KATIE GRAY, 1886.

PUFF, puff, puff, was tediously detonating in the ears of the members of the Oswego Y. C., who were fortunate enough to be owners or guests on the annual cruise. Through the lack of wind the sail of 60 miles was quite impossible; a puff of smoke, a rumble over the waters and against the timber of the breakwater, and the tug which had been chartered steamed to our yacht (the flagship) for orders, and the yachts were picked up according to size, making a pretty array as they tailed out behind the tug with their side lights burning and a liberal display of Coston and colored fire. All through the hours of the night the high-pressure engine sent out its volleys of puffs, broken only by the picking up of a yacht which had wandered away from the fold. A small tug towing seven good-sized yachts does not make over 5 miles an hour, that we found out as we noted our time of arrival at Charlotte next morning.

The Fourth of July was a perfect day, and with the Atalanta, Ariadne, Emilie, Ethel, Cygnet, Katie Gray, Vision, Irene, Cricket, Laura and Ella riding at anchor off the hotels, no prettier sight could be desired. The lake surface was like a mirror during our two days' anchorage. A large party was invited by the Commodore on board the Cygnet, her owner kindly tendering her as our flagship could not accommodate so many; and a glorious spin of two hours followed. A very hospitable invitation was received from the owner of the Magnolia Cottage to make our headquarters at his beautiful summer home. The fifth of July, in the evening, was turned into day by the illumination on land and sea. At midnight all was still save the rattle of sheaves as the different yachts hoisted sail; anchors were broke and the Atalanta, Ariadne and Katie Gray pointed for the north shore. The Oswego fleet again took the tug's line and were soon on their way toward home. It was hard work for our man at the wheel to keep his eyes open—in fact he did not; at times we were at the mercy of the winds, heading W. instead of on our course, N½ E. with the S.W. breeze. At six bells the three yachts were about abreast. At daybreak our taffrail log showed only 15 knots, and the lofty topmasts of the Atalanta and Ariadne were discernible close to each other, a couple of miles ahead of us. In the course of fifteen minutes they disappeared as if by magic, as a mist shut them from sight. The sun rose red and clear and presaged a beautiful day.

About 6:30 A. M. the big yacht hove in sight, coming out to meet us; all hands turned out and we cracked on sail, our spinnaker being set to port. When we were in sight of Presque Isle, we caught it so heavy out of the bay that we were forced to put in a couple of reefs, while the larger yachts managed to work with cabin tops under, to an anchorage off Brighton. The hour and a half spent in reefing at anchor off Presque Isle taught us something, never to lime sails before starting on a pleasure cruise; the canvas was like sheet iron, and the reef points like wire. As we got under way and beat through the channel, we were surprised at the frequency of lighthouses, no less than five in a radius of three miles. We were nearly exhausted when we pulled the lanyard out of our little gun as our anchor sought holdings in the muddy waters of the bay. A cheery sound was wafted to our ears from the quarter deck of the Atalanta, in the shape of an invitation to breakfast from her charming hostess, which was readily responded to and heartily enjoyed. An energetic grocer from the village a mile and a half distant, who must have sighted the spars of the yachts, was on deck, and a good square account was scored against us before he sculled to the Ariadne.

We were now among old friends, it was needless to inform us that we were in a foreign land, as we seated ourselves in our brother yachtsman's dog cart with the reins thrown over the shoulders of his young and rosy-cheeked sister; glances of "it's English, you know," were exchanged between the sunburned New Yorker and the commodore. The dust was flying like clouds of spray. As we pulled up at the porch of the old mansion and were ushered into the cool and stately drawing-room. A pleasant visit on board our yacht in the evening and we bade them goodbye, called aboard the Ariadne, and after agreeing to make an early start, turned in and dreamed of nothing—for the sleep of a weary Jack tar knows naught of dreams.

Wednesday morning we were astir at 6:30, and after our apothecarey had rowed the dingey to the Ariadne and roused them from their slumbers, a light, hot breakfast was disposed of, and with our two reefs still in, we let go and were soon at the Presque Isle light, at which point we threw our log overboard, and the following readings were taken as we jogged along down the north shore of Lake Ontario:

		Log.	Distance. Nautical miles each hour.
A.M.			
7:35	Presque Isle	44.50	....
8:35	" "	50.50	6.00
9:35	" "	56.88	6.38
10:35	" "	60.50	3.62
11:25	Salmon Point	65.25	....
11:35	" "	66.25	5.75
P.M.			
12:25	Log Point	69.50	....
12:35	" "	70.00	3.75
1:35	" "	75.50	5.50
2:35	" "	82.00	6.50
2:55	South Bay Point	84.60	....
3:35	" "	86 50	4.50

As this run was made with the wind after us, the early portion of it double reefed, and the latter with spinakers, we note it down as an illustration of the correct distances and the average speed of a 33ft. boat, with everything favorable. We made the distance from Presque Isle to South Bay Point, 46 78 statute miles, in 7h. 20m., averaging 6.50 miles per hour, not an extraordinary performance, but in all probability if we had no log we would have all taken oath we were making ten miles per hour. I might mention that our apothecary took the quarter miles while we were apparently moving the fastest and found that a fraction over 9.75 miles was the greatest speed attained.

After we broke out our spinaker the scene was worthy an artist's brush; the big Ariadne with spinaker set, foaming along; and the Katie Gray groaning under the pressure of her canvas, endeavoring to keep up with her powerful consort. It was our fight for half an hour, when a little sea made up and the big boat forged ahead. As we were bowling along the shore a hull and two naked spars loomed suddenly up out to sea. We read the name Eliza Quinlan as we passed under her stern inside of the shoal, on which she had met her death. As we hauled on the wind around South Bay Point, the Ariadne was far out in the Lake, reaching for the Duck passage. We set our jibtopsail, but were forced to take it in again, as the heavy puffs struck us from off the head of Amherst Island. It kept freshening, we staggered along and held our lower canvas by carrying half a full until we weathered Indian Point, when the wind went to N.E. and screeched until we had to put in two tucks before the wind and watch her very closely. The Ariadne came to anchor about four miles below the stone mills. We were about to drop anchor off Davy's Island, as we saw a large number of people on its shores, when a big steamer came along and depopulated the island, so we continued on until becalmed at dark at the foot of the beach, where we dropped anchor, having sailed 83 miles in 12 hours, an average of 7 miles per hour, with the wind ahead for 10 miles.

From the appearance of the high wooded banks we supposed we were very close to shore, but a large side-wheeler coming along at a high rate of speed and passing inside of us, convinced us that we were decidedly mistaken. After some argument as to who should go, two of the boys seated themselves in the dingey and started to find some farmhouse for milk. After a long pull to shore they clambered up the steep bank and found themselves confronted with a dark forest; still persevering they encountered the inevitable dog, which struck terror to the souls of the wretched yachtsmen. Happily the farmer awoke, and learning the wants of the intruders he called in his dog, dressed himself and filled the can with foaming milk.

Thursday.—The wind was ahead and blowing hard. We got under way, and after tacking a few miles in company with a big scow, we were compelled to reef. We threw the lead over Capt. John's shoal, and starting our sheets, went flying up the bay. The wind fell light and finally died away, leaving us a helpless drift near the sunken schooner. Baffling puffs were moving here and and there; the afternoon was half gone when we fetched the Belleville Light, where a puff hit us which put our lee rail under and sent us foaming up the harbor to our moorings. We were now in the Katie Gray's old home, and many a word of welcome was wafted to her. On these waters our craft had participated in many an exciting contest. Of the thirty-seven races engaged in by the Katie Gray, sixteen were sailed at Belleville; nine of these were firsts, five seconds and two thirds. The old-timers told us that the most exciting struggle ever witnessed there was at the time the sloop Emma contested for the supremacy of the bays. They came together on the 25th of September, 1880, for $100 a side. Cuthbert sailed the Emma and Dora Claus the Katie Gray, the latter putting her main boom at the end of the Emma's bowsprit and staying there to the finish.

Our visit in the city of Belleville was a most pleasant one; most of the yachtsmen we met in the days of yachting in the old open boat Phantom were gone, some to their eternal sleep, some to distant climes. An invitation from the officers of the Bay of Quinte Y. C. was accepted, and stepping on board of a steamer, we were soon on our way toward the lower waters of the river Trent. As we sped along my eye was attracted by a white city on the water's edge. I was informed that it was Belleville cemetery, and under its beautiful surface were resting the remains of the late ex-Commodore Jim Clark. What a resting place for a yachtsman on this silent shore, within easy hail of the passing sail, and almost touching the shadows of the white-winged craft as they glide by.

They laid him by the pleasant shore,
And in the hearing of the wave.

My reflections were broken by the announcement that we were sighting the embankments of the Murray Canal. This waterway will connect the yacht clubs on the North Shore with the Bay of Quinte, avoiding the long twist around through the Gap. After inspecting the entrance to the canal we turned our course toward Trenton, ran alongside of dock, and turned our attention to a game of base ball, which we learned had been in progress since early in the day. It was now about four o'clock, the fifth inning was on, the score stood Trentons 98, Belleville 12. Our Canadian friends have something to accomplish before they can boast of playing base ball.

As we were preparing to leave Trenton we fell in with a couple of gentlemen from Syracuse who were anxious to catch a train at Belleville. Our host invited them aboard and we were soon bound for the city. As we neared Belleville a skiff containing four hard-pulling fishermen was overtaken, the engine stopped and the skiff was taken in tow. We were amply repaid for our trouble, as one of the gentlemen possessed a bass voice of tremendous scope. "Launch the Lifeboat," "Rocked in the Cradle of the Deep," and one or two nautical ballads were rendered. After a lively entertainment at the Dafoe House we turned in.

The Ariadne got under way at 8 A. M. At 11 o'clock we hoisted sail and, accompanied by the Iolanthe, with a fair wind went out of the piers and bore away for Massasaga Point. After visiting on shore for a time we again got underway, exchanged salutes with the Iolanthe and found ourselves as Deseronto about 2 o'clock, and Commodore Rathbun, of the A. C. A., came on board. After looking the place over we again embarked and had a hard tussle under two reefs working down the beach. We anchored off Davy's Island about 6 o'clock. We fell in with a party from Napanee and passed a pleasant evening in the parlor of the hotel with music and singing; turned in at a late hour after sitting on deck for three hours to enjoy the moonlight.

After breakfast we took a run to the Stone Mills. The landlady claims to have been American born, and whenever a Yankee is known to be within sight she runs up an immense American flag. If you look likely to possess a five cent piece she will shake hands with you, and by secluding yourself carefully behind the kitchen door you may manage to be presented to a bottle of pop. At this beautiful resort we met an old yachting friend, one of the famous quartette of the yacht Gracie, who, with his wife, called on board. The wind was fair, and as all the points had been touched as per programme, and as our vacation was nearly exhausted, we shaped course for Oswego, but were brought to a stand-still at Indian Point by a head wind and heavy sea. The first time we were compelled to turn from the bent of our inclination and await the calming of the briny deep. At 7:30 P. M., the sea having gone down, we started on our home stretch, about 50 miles. The wind was dead after us and fresh. At 9:35 we passed South Bay Point. As we got away from the land we found a long, heavy swell on the lake, the sensation of gently rolling up one side and down the other of these big fellows was very pleasant. We steered a westerly course for Oswego, sighting land above Lewis Bluff. Our log made 89,743 revolutions on the run across, indicating 52 79-100 miles. Our actual time under way on the cruise was three days and three nights, during which we covered 324 miles. At 8:50 on the morning of the 12th of July we rode at our buoy off the Oswego Y. C. house, our cruise ended as far as crawling out at 8 bells is concerned, but alive in its pleasant recollections and food for our scrap book in the FOREST AND STREAM.

KATIE GRAY.

A NEW YACHT CLUB ON STATEN ISLAND.—For some time past the scheme of a yacht club in connection with the Staten Island Athletic Club has been talked of, and the matter has at last taken definite shape in the appointment of a committee to arrange the details of organization. This committee consists of Messrs. A. L. Ferris, R. K. McMurray, Vice-Commodore Brooklyn Y. C., and W. F. Dessosway, all, of course, members of the Athletic Club. The club now owns a large and valuable property facing the Kill von Kull, on which it has a fine club house with restaurant, a ball field, running track, tennis courts, and lawns for croquet and archery, while its water front extends for 250ft. along the Kills. Here a new club house is now building to replace the one lately carried away, and in connection with it will be a suitable anchorage for the yachts. The grounds are nearer New York than any similar club, being only 35 minutes from the Battery, while the club house and other attractions will make the new club a most desirable anchorage for yachtsmen.

THE NEW STEEL YACHT.—Work is going on at City Island on the new Burgess boat, and she will soon be in frame. Her dimensions are given as follows:

Length over all	82ft.
Length l.w.l.	69ft. 09in.
Beam, extreme	21ft.
Beam, l.w.l.	19ft. 11in.
Depth from plankseer to keel	12ft.
Freeboard	3ft. 02in.
Draft	8ft. 09in.
Draft, with board	16ft. 09in.
Displacement, long tons	75
Ballast on keel, long tons	30
Area midship section	67sq. ft.
Mast, heel to cap	72ft.
Topmast	35ft.
Bowsprit, outboard	24ft.
Boom	68ft.
Gaff	38ft.
Spinaker boom	64ft.
Hoist of mainsail	46ft.

The centerboard is 20ft. long.

DAUNTLESS AND CORONET.—Both of these schooners are now busily preparing for the ocean race next month. Dauntless has hauled in next the screw dock and is in the hands of riggers and shipwrights. Mr. Phillip Low will take out both of her masts and they will be shortened about 5ft. Messrs. Poillon will do all the woodwork, including a shortening of the bowsprit by 3ft. and the main boom 5ft. Captain Samuels is superintending the alterations. Some repairs are being made in her hull and some lead will probably be added to her keel. Coronet is receiving a general overhauling and she, too, it is reported, will have 10 tons of lead bolted up outside.

AMERICAN Y. C.—A meeting was held Feb. 1 to consider the question of a club house, the result being that after some discussion it was decided to go to the Sound rather than New York Bay. The sites considered were College Point, Throgg's Neck, Larchmont, Captain's Island, Cold Spring Harbor, Monhasset Neck, Glen Cove and Calf Island. The committee will report again in two weeks. It is proposed to erect a very fine club house, costing upward of $75,000.

THE WESTON HOUSEBOAT.—Mr. Frank W. Weston, the architect of Boston, so widely known among wheelmen as one of the first promoters of the bicycle in America, is the author of the plans in the last issue of the FOREST AND STREAM, which a ruthless printer entitled a "'Western' Houseboat." Mr. Weston has of late turned his attention to the houseboat, and is doing much by his writings to encourage the introduction of this useful craft.

A NEW STEEL STEAM YACHT.—Mr. Burgess has designed a steam yacht for Mr. J. M. Forbes, and the vessel will be built by the Atlantic Works, at East Boston. She is 108ft. L. W. L., 17ft. beam, and resembles the Hanniel, designed by Mr. Burgess last year. Her plating will be of ¼in. steel.

A NEW KEEL YACHT IN BOSTON.—Mr. Burgess has ready the design for a keel yacht, 36ft. load waterline, 12ft. beam and 7ft. 8in. draft, to be built by Lawley & Son for a Boston yachtsman. She will race in the same class with Shona.

METEOR.—Vice-Com. Bateman's steam-yacht has been fined $500 for calling at Tampa, direct from Havana, mistaking the former place for a port of entry. Application has been made to Washington for a remission of the fine.

THOUSANDS are born with a tendency to consumption. Such persons, if they value life, will not permit a cough or cold to become a fixture in the lungs and chest. The best known remedy for either is Hale's Honey of Horehound and Tar. PIKE'S TOOTHACHE DROPS cure in one minute.—*Adv.*

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

G. W. R., New Haven.—See Rifle columns.

F. C. R., Logan, O.—Future litters probably will not be affected.

E. B., Boston, Mass.—Write to Wm. T. Reynolds, Poughkeepsie, N. Y.

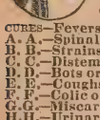
J. T. W., Waterbury, Vt.—There is no objection if the dog is mature.

E. B. F., New York.—We know of no centerboard pilot boats for many years back.

CONSTANT READER, Brooklyn.—The gun stands well. It can be had of any one of the New York dealers.

W. P. L., Richmond, Va.—Dr. Henshall's "Book of the Black Bass" is the best on the subject. A more general work is Norris's "American Anglers' Book."

S. A. W., Toronto.—You will find full sizes for such a canoe in "Canoe and Boatbuilding for Amateurs," together with explanation of terms, such as rabbet. A method of converting an open into a sailing canoe was given in the London *Field* of Jan. 1, 1887.



J. G. B., North Vassalboro, Me.—What book do you publish, if any, in regard to the hunting of ducks and geese, their flight and habits, but more especially the mode of hunting them? Ans. Hallock's "Sportsman's Gazetteer."

SUBSCRIBER, Boston, Mass.—Will you kindly inform me whether a person owning the whole of an island on the coast of Maine has a right to shoot deer that are on it at any time of the year and by any method? Ans. He can lawfully take the game only in the season and by the methods sanctioned by law.

R. M. C., Kingston, Ont.—1. I have camped out for the last few years, but always in the woods and building my own shanty, but next summer I intend to go with another fellow to the shore and take a sailboat and tent. I would like to know what sort of a tent and boat would be suitable for us. I may say that we are neither of us good sailors, so we would like to get a pretty safe boat. 2. Is a 12-bore gun heavy enough for ducks? Ans. 1. The FOREST AND STREAM Cruiser was designed for such work, and is a safe and easily handled boat. The Clyde tent, described in "Canoe and Boat Building," is large enough for two and very convenient in form. 2. Yes.

THE TRAVELERS, of Hartford, has paid an average of 21 claims a day in the accident department since it started.—*Adv.*

The Fluttering Fly.

PATENTED MAY 4, 1886.

THE FLUTTERING FLY.
Patented May 4th, 1886.

With the exception of our Patent Compensating Reels and Section Bamboo Rods which we introduce to the public, this fly, invented by Mr. Wakeman Holberton, is unquestionably the greatest and most radical improvement in fishing tackle ever made. The chief points of manifest superiority of this method of tying flies over the old-fashioned way are:

1st—The wonderfully life-like and fluttering motion this fly has when moved on the water.

2d—The fish is almost certain to be hooked if it touches the fly.

3d—Any of the present favorite combinations of color and form can be tied in this way. Thus, those who believe that fish are attracted by particular colors or forms of fly, can have their old patterns in the patent style.

4th—These flies not only offer less resistance to the wind in casting, but more resistance to the water in drawing. Hence one can do as good work with a small hook tied this way as a large hook tied as before. Experience proves that flies dressed this way can be tied on hooks two sizes smaller than one would use on old-fashioned flies.

We take this means of notifying dealers and fly-tyers that we shall prosecute any infringement of our rights under this patent to the fullest extent of the law. Our course, in regard to the protection of our patents and copyrights, is known to some people. We assure such people that the same old course will still be pursued by this firm.

We add a few extracts selected from the numerous and unanimously complimentary press notices of this fly. We could add many letters from well-known and expert anglers if we were willing to drag the names of private gentlemen into our advertisements.

Scientific American: "When so arranged the wings offer less resistance to the air in casting. As the fly is slowly drawn toward the angler the wings expand, and give it a fluttering, life-like motion, much more alluring to the fish."

Forest and Stream: " * * * more like a natural insect than the old patterns whose wings close when being drawn through the water. * * * Great merit lies in its superior hooking qualities. A fish cannot nip at the wings or tail, but swallows the hook before any part of the fly."

American Angler: "There is no question as to the killing qualities of this fly. All fish are attracted more by the action of the fly than by color or form. * * * This fly will certainly, when drawn against the current or over a placid pool, *seam* the surface with an attractive wake, and its expanded wings will create a fluttering motion, assimilating the struggles of a live insect. * * * We are told that few fish are lost by those who use this fly. We do not doubt it."

Canoe and Camp Cookery.

By "SENECA."

A practical cook book for canoeists, Corinthian sailors and outers. Practical because the author gives explicit and intelligible directions for preparing such dishes as he has himself actually tested in camp and on a cruise. This is just where the recipes differ from the absurdly impracticable dishes given in some so-called camp cookery books. The cooking outfit is described, and numerous hints on camp economy add to the value of the work. Cloth, 96 pages. Price $1.00.

A WORD IN SEASON.

Readers old and new of the FOREST AND STREAM may be pleased to know that the paper is now at the close of 1886 enjoying the support of a wider circle of friends than at any former period in its history. This is an interesting fact, for it proves, with the best possible demonstration of success, the sound sense of the theory long ago adopted by editors and publishers, and steadfastly adhered to, that there is room in this country for a journal treating the subjects embraced by our departments, and depending for its support wholly upon what have been accepted by the conductors of the FOREST AND STREAM as legitimate journalistic methods. In other words, we have kept faith with subscribers by devoting our reading columns exclusively to honest reading matter, and have not given up our pages to extended paid puffs of railroad routes clumsily disguised as accounts of sportsmen's travel, nor alluring descriptions of wonderful agricultural regions, all paid by the column. The conviction that a sportsman's journal for sportsmen could be conducted without resorting to such questionable makeshift expedients have proved quite correct.

The tone and high character of the journal, as one fit for sportsmen to receive into their homes, will be jealously maintained. As there is nothing in the recreations of field and stream inconsistent with the highest type of manhood, so, the editors are convinced, there should be in a journal like the FOREST AND STREAM nothing to offend good taste.

The FOREST AND STREAM will be, in the future as in the past, thoroughly representative of the best field sportsmanship of America. It will maintain its position as the chosen exponent of those who seek recreation with gun or rod, rifle, canoe or yacht. Its character will be scrupulously preserved, and readers in 1887 may expect a rich fund of sporting sketches and stories, suggestions, bright sayings, prompt, reliable news, and interesting discussions. Angler, shooter, dog breeder, canoeist and yachtsman, may be assured that whatever is of interest in these respective fields in 1887 will find its way into the columns of the FOREST AND STREAM.

The Sportsman Tourist

columns are filled with bright sketches of travel, camp life and adventure, the reflected experience of a host of outers.

Natural History.

Papers descriptive of bird life, chapters of animal biography, notes on the ways of field, forest and water creatures as observed by sportmen, anglers and naturalists, make up these pages. The special work of the past year has been the establishment of the Audubon Society for the Protection of Birds, begun in February, and having now a membership approaching 20,000.

Angling and Shooting.

Time was when a single journal sufficed in this country for adequate discussion of all the heterogenous pastimes and practices dubbed sport. That time has long since passed away Some of the sports have been outgrown or put under a ban, others have developed to such a degree that each class requires a special organ. The particular fields chosen by the FOREST AND STREAM are those of angling and shooting. The pages given up to these topics are rich with the freshest, brightest, most wholesome, entertaining and valuable open air literature of the day. They have the sunlight and woodsy odor of the haunts of game and fish; they picture nature as seen by sportsman and angler. One has not long to read the FOREST AND STREAM before learning its attitude with respect to game and fish protection. The editors believe in conserving, by all legitimate methods, the game of fields and woods, and the fish of brook, river and lake, not for the exclusive benefit of any class or classes, but for the public. They are earnest, consistent and determined advocates of strict protection in the legal close season, and in restricting the taking of game both as to season and methods, so that the benefits of these natural resources may be evenly distributed.

The Kennel.

This department has kept even pace with the growth of the interest of breeding field and pet dogs. Reports of trials and shows are usually given in the FOREST AND STREAM in advance of other publications, and being prepared by competent writers their intelligent criticisms are of practical utility. This journal is not hampered by personal animosities. It has no judges to "kill." It does not decide a dog's merit by asking who the owner is. It treats all kennel subjects without fear, favor or ulterior motives, and in consequence enjoys a degree of public confidence and esteem denied to such as stagger beneath the incubus of malice and flounder in the bogs of ignorance.

Rifle and Trap Shooting

records scores of meetings and matches, discussions of topics pertaining to the butt, gallery and trap. Secretaries of gun and rifle clubs are invited to send their scores for publication.

Canoeing.

This country is a land of magnificent water courses, and Americans are just beginning to appreciate the canoe as a means of enjoying the delectable charms of river and lake, and bay and canal. The men who are making fortunes by making canoes know best how rapidly the ranks of canoeists are multiplying. Novices and old hands will find in the FOREST AND STREAM canoeing columns, in charge of a practical canoeist, accounts of cruises, lines of new craft, and hints and helps and suggestions without number. Closely allied is

Yachting,

in which the FOREST AND STREAM is the only competent, all-the-year-round, intelligent exponent. Our reports of races are full, prompt and accurate. The numerous illustrations of lines of new yachts make an invaluable record of the development of yacht building.

Weekly, $4 per year; $2 for six months.

The Kennel.

Grand Bon-Secours Kennels.

Near Péruwelz (Hainault), Belgium.

ESTABLISHED IN 1865.

Property of Mr. Aug. Tondreau Loiseau,
BANKER AT PÉRUWELZ.

These kennels enjoy a wide-spread fame, and hundreds of sportsmen of the highest authority in the doggy world can bear witness to the scrupulous good faith which governs their operations, and the remarkable merit of many of the dogs which have gone out from them since 1865. The collection consists exclusively of English sporting dogs. Besides a splendid collection of English stud and field dogs—Laverack, Gordon and Irish setters, large and small pointers, Clumber, Sussex, Norfolk and black spaniels, large curly or wavy-coated retrievers, all of the most noted blood—which are employed for breeding and whose young are offered to the public, these kennels always have for sale a large number of other English dogs, warranted to be of pure and noble blood, handsome and good, of full pedigree, thoroughly trained to obey, to charge at the uplifted hand, and to retrieve perfectly all kinds of game.

The kennels are constantly open to visitors.

Adult and trained dogs can be shipped at Antwerp (Belgium) destined for the principal ports of the two Americas.

MT. PLEASANT GORDON KENNELS.—For Sale—Thirteen solid black and tan Gordon setter dog puppies, out of Chloe Beaulah and Bell Mont, by Argus II. THE NATIONAL PARK BILL.

THE bill to provide a government for the National Park has been referred to the Committee on Public Lands of the House of Representatives, of which Hon. T. R. Cobb, of Indiana, is chairman. It is hoped that it may be considered this week by the Committee and favorably reported. There is the more reason for this belief because the House once before passed a bill quite similar to the one now before it, which bill failed to become a law only because the Conference Committee of the Senate and House could not agree on some details of the bill. Of the widespread interest felt in the fate of this measure there is no doubt. Each mail brings to us letters from individuals, clubs and societies in all parts of the country urging us to aid the bill by every means in our power, and promising to lend their assistance.

The time remaining in which to take action on this measure is so short that it demands energetic and concerted work by each one who feels an interest in the subject. Those who have visited the Yellowstone Park, and many who have not, believe that that reservation is worth preserving, that the persons and the property of the tourists who visit it ought to be made safe, that the forests ought to be protected from fires, the geysers and hot spring craters from mutilation and the game from wanton slaughter and speedy extinction. If every man and every association of men who feel in this way will take the proper steps to interest their representatives in Congress in this matter, there is hope that the bill may become a law at this session. It is not enough that these representatives should be asked to vote for the bill. They should be urged to take an active interest in it, to see that it be called up whenever there is a chance for it. This they will do if they are made to understand that their constituents desire such action on their part.

In another column will be found a letter from Mr. Phillips to the Chairman of the Public Lands Committee, answering very ably the one or two objections which have been made to the bill. The document is clear, concise and forcible, and should carry great weight. This letter should be read with the one from Mr. Hague to Senator Vest, of Feb. 4, 1886, which we published nearly a year ago. The two furnish an unanswerable argument in favor of the protection and extension of the Park.

The influence of the forests on rainfall is so little understood, that it is probable that few Congressmen appreciate the dire results which must follow continued neglect of this great forest preserve. It has been estimated that the waters drawn from the Yellowstone Park supply between 9,000 and 10,000 miles of river length. The banks of these rivers are now, or will be as the country settles up, made fertile by irrigation from these waters. It is believed that on an average a territory five miles in width, or two and one-half miles on either side of these streams, can thus be made arable. But this can only be done if the streams remain at their present level. If they are diminished in volume the lands furthest from the rivers cannot be reached by the waters, and any serious diminution of the volume of the streams, such as would be caused by extensive forest denudation, would reduce the water in the creeks and rivers to so low a point that any irrigation would be impossible.

According to these figures, therefore, the arable character of a territory containing from 45,000 to 50,000 square miles depends upon the proper protection of the Yellowstone Park. This is so important a matter that it surely ought to receive the attention of the House of Representatives.

THE GOOSE KILLERS.

THE fable of the youth who killed the goose that laid every day a golden egg for him, has been told by tongue and print so often and for so many years that every one must have heard or read it, but it would seem that few had profited by it when year after year so many go on killing the geese that lay eggs of gold for them. It is no great matter of wonder that the thoughtless and purely selfish should do so foolish a thing, but it is almost past accounting for that those who are forecasting and prudent in the general affairs of life should be so blind to their interest. When the wild geese come honking along the April sky, and wild ducks tarry a little on their journey in waters just unsealed, and snipe drop down on the thawing marshes to rest and feed, and flocks of shore birds skirt the long coast, all on their way to summer homes to lay eggs that would be golden in golden autumn, the goose killer is in wait for them all along their thoroughfare at every halting place, greedy for the most, craving the last of them. Then when he has wrought what havoc he can, though not the half he would, with these, and the frightened survivors of the harried flocks of migrants have gone their way to the savage but kinder far North, he amuses his bloodthirst a while with spawning bass and trout fry too small to wear a visible spot, and boasts shamelessly of the numbers he has caught.

Presently the woodcock are hatched and able to fly and so are the young grouse, and the half-grown plover are making short flights across the fields they were born in and were never outside of, and the goose killer is in his glory now, for he can smell powder and taste warm blood again. It matters little to him what the husbanded chances of the future might bring, he counts a tough morsel to-day better than a tender feast to-morrow. A lean waterfowl in spring, an untimely taken fish, a half-grown woodcock, or grouse or plover in summer time are more to him than the dozen or score of each that might be hatched from the golden egg, and might be taken by and by in their proper season—by some one else, perhaps. Aye, there's the rub that brings upon the world the calamity of the goose killer's existence and evil deeds. He must have what he will to-day, lest some one get more to-morrow, though there be nothing left for any one to-morrow. If there were no hounding of deer, the world might come to an end before he could boast of killing one, he, meanwhile, eating his own heart with bitter sauce of envy, beholding the skillful hunter kill his stag often by fair and sportsmanlike methods. What is it to him that there should be no deer in all the woods twenty years hence, so that he to-day clubs to death one suckling doe?

Nor is this so-called sportsman the only goose killer whose wrongdoing makes us all suffer. For his and the milliners' profit and the barbarous ornamentation of women's head dress, another ruthlessly slays the harmless and useful beautiful birds, to the world's loss of song and beauty and goodness. The farmer and the lumberman strip mountain and swamp of forest growth for a little present gain and the world's irreparable loss, the loss of copious springs and streams, and loss by disastrous floods. A few greedy speculators combine to spoil the nation's park for their own selfish gain, shameless, unscrupulous; and the nation looks on almost unconcerned, with but here and there out of the millions concerned, a voice lifted in condemnation of the outrageous scheme of destruction.

So the ceaseless warfare against nature goes on, till one is almost ready to despair that the race of goose killers shall be removed from the face of the earth till the last goose that lays an egg of gold shall be killed; that the destroyer shall pass away only when there is nothing left for him to destroy.

SNAP SHOTS.

FINN'S bill has been put in. Finn is from New York city. His bill is designed to repeal the short lobster law. Finn says the change is asked for by the fish dealers of his district. Finn is probably mistaken; and his little bill will probably be squelched. Finn stands for a band of avaricious dealers who want to open this port for the reception of immature lobsters, traffic in which is forbidden by the laws of other States. Finn's backers are scheming to provide a market for this illicit merchandise. So that they make a dollar to-day, tomorrow may look out for its own lobsters. Finn and his clique do not fairly represent the fish dealers of New York. The Legislature ought not to be inveigled into believing that he does; but the Legislature, we regret to say, can be inveigled into believing anything. On matters of fish and game protection the average Assemblyman takes a positive delight in being bamboozled.

The sundry civil bill provides an appropriation for the Park as follows: "For every purpose and object necessary for the protection, preservation and improvement of the Yellowstone National Park, including compensation of superintendent and employees, forty thousand dollars; two thousand dollars of said amount to be paid to a superintendent of said Park, and not exceeding nine hundred dollars to each of ten assistants, all of whom shall be appointed by the Secretary of the Interior and reside continuously in the Park, and whose duty it shall be to protect the game, timber and objects of interest therein; the balance of the sum appropriated to be expended in the construction and improvement of suitable roads and bridges in said Park, under the supervision and direction of an engineer officer detailed by the Secretary of War for that duty."

Mr. Erwin, of St. Lawrence county, has introduced into the New York Legislature a bill to exempt his district from the operation of the song bird law. It cannot be that Mr. Erwin fails to recognize the wisdom of the law; he is probably acting at the instance of some of his foolish constituents. The law is a good one, and it is just as good for St. Lawrence as for the rest of the State. To pass Mr. Erwin's bill would be to add to that jumbled collection of special laws and exceptions to laws, which is a disgrace of long standing.

The widow of Hugh Conway has protested that some of the trashy fiction which purports to have been written by her husband did not come from his pen. This is very likely true enough, and we extend our sympathy to Mrs. Conway as well as to the writers whose reminiscences of the late Ned Buntline have been hashed over and put forth as his own by one "Will Wildwood."

The Agassiz Association, established by *St. Nicholas*, has outgrown the space which that magazine can devote to it and it is to have a journal of its own, the *Swiss Cross*, to be edited by the president of the association, Mr. Harlan H. Ballard, of Pittsfield, Mass. The *Swiss Cross* may prove a valuable adjunct of the *Audubon Magazine* in the latter's special work.

A bill recently introduced into the Indiana Legislature prohibits the shooting of quail and prairie chickens indefinitely, but makes no provision against unlimited trapping and snaring. There is a very large African in that woodpile.

A New York astrologer, convicted of sending girl dupes to their deaths in Panama, has been given the righteous sentence of fifteen years in the State prison. Florida land-sharks, who inveigle entire families down to the miasmatic wastes of southern Florida, go scot free.

SAM LOVEL'S THANKSGIVING—I.

BEING SOME MISSING LEAVES OF "UNCLE LISHA'S SHOP."

ONE gloomy day in November several of Uncle Lisha's friends, realizing the fact that it rained too hard to "work aou' door," that it was too wet even for comfortable hunting, and that it was too late in the season for fishing, betook themselves singly and in couples to the shop to pass away the time which hung with unendurable heaviness upon their hands at home. There was a genial warmth radiating from the full-fed rusty little stove, and a mild sunshine from the kindly face of the old shoemaker that made the rude interior seem exceedingly comfortable in contrast with the dismal chill and dampness of the outdoor world, and the clatter of the hammer on the lapstone was a much more cheerful sound than the leaden patter of the rain on roof and pane and fallen leaves. But though the newcomers gave some impassive signs of appreciation of the change from outdoor discomfort to indoor comfort, they seemed to have brought in with them too much of the exterior atmosphere; it exhaled from their wet garments and dulled spirits till their host felt it and resented it.

"Good airth an' seas! boys, what's the motter ails ye, all on ye? Ye aint no sociabler 'n a passel o' snails holdin' a meetin' 'n under a cabbage leaf! 'Taint a fun'el. By mighty, it's wus, for the' haint no preachin' ner singin', ner even sighthin' ner cryin'. Why don't some on ye up an' die an' kinder liven up things a leetle mite, hey?"

While Solon Briggs was swelling up with explanatory words too big for speedy utterance, Joseph Hill remarked, as he searched all his pockets for the pipe and tobacco that he never knew where to find, "I 'spect, as Joel Bartlett says when he takes a notion to start off on a preachin' tower, 'at we've all on us got a weighty consarn on aour mind, Uncle Lisher."

"Wal, Jozeff hes spoke, an' that's incouragin'. Naow let another, as Brother Foot says in prayer meetin'."

"Jozeff's speakin'," continued Uncle Lisha, after waiting a moment for a response, "puts me in mind o' his dawg 'at he uster hev, 'at nob'dy never knowed to du nothin' on'y eat an' sleep, an' bark a' folks goin' 'long 'baout the' business, an' at the moon nights, when folks was extry tired an' wantin' t' sleep more 'n common but couldn't, 'caount o' his 'tarnal bowwowin' an' yollopin'. Jozeff, howsever, was allus a tellin' what a good dawg he was, an' even went the length o' sayin' 't he was harnsome! A yaller dawg, an' harnsome! Haint that so, Jozeff? Don't ye deny it!" he roared, glaring at his visitor between his eyebrows and the rims of his spectacles as he began to fashion a slow, dubious "wal" with his lips. "Yes," he continued, "good an' harnsome, he said he wus. You never seen a man 'at hed him a dawg 'at wa'n't a braggin' 'baout him on some pint. That's one reason 'at I don't hev me a dawg. I haint no gift o' braggin'. 'Nuther is, I haint no use for a dawg in my business. Wal," picking out the soggy "heel" of his pipe with a crooked awl, "one day when Samwill here an' 'mongst 'em was exhaltin' of the' horns an' a blowin' on 'em 'baout the haoun' dawgs, Jozeff he up an' bigin blowin' his'n abaout his'n. Someb'dy nuther ast him, 'What'll he du? Did he ever tree a coon?' 'No,' says Jozeff. 'Er hole a woo'chuck?' 'No.' 'Er drive a k'yow er a hawg?' 'Wal, not ezackly drive 'em.' 'Er ta' keer o' the haouse?' 'Wal, he's allus there, but I do' know 's he raly takes keer on't.' 'Wal, then, what on airth is he good for?' 'Wal,' says Jozeff, says he, arter c'nsid'able c'nsid'rin', 'he's comp'ny!' An'," said Uncle Lisha when he had blown through his pipe after clearing the stem with a waxed end, "I'll be dum'd 'f I wouldn't druther hev Jozeff Hill's ol' yaller dawg for comp'ny 'n t' hev sech a consarned mumpin' set as you be."

The only responses were a general though feeble and perfunctory laugh and an apologetic remark from Solon Briggs that "when the caloric of the warmth had penetrated the water aouten their garments they would be more conversationabler," which Antoine endeavored to make more easily comprehended by explaining, "Yas, Onc' Lasha, when we'll got aour froze t'aw aout we'll got aour speak t'aw aout."

A little later the constant searcher for information broke the silence by asking Joseph Hill, "Whatever be become o' that 'ere dawg 'at Uncle Lisher ben speakin' on?"

"M'ri sol' him tu a peddler," said Joseph with a sigh of regret for his lost companion, "M'ri didn't never set no gret store by dawgs, though the' be women 'at likes to hev a dawg 'raound, for all the' makin' b'lieve hate 'em—likes to hev 'em 'raound to lay things onter, bad smells an' sech, an' broken airthenware, an' t' 'buse—wal, I do' know as 'buse ezackly, but tu vent the' feelin's on. But M'ri never 'bused Liern, though I don't think he raly 'nj'yed her comp'ny, 'specially moppin' days an' when she was sweepin' aout."

"Wal, I do' know's I blame anybody much for mumpin' sech weather," said Uncle Lisha, relenting, as while he ground the pegs from the inside of a newly topped boot, he gazed abstractedly out of the rain-pelted little window upon the blurred landscape; the sodden dun fields bounded by the gray wall of mountain with its drifting coping of mist—all dun and gray but for one poplar that shone like a pale flame among the ashy trunks and branches of its burned-out companions, and when a gust fanned it, showered down its yellow leaves like sparks from a flaring torch. "I do' know 's I blame any on ye much; sech weather 's turrible hefty on the sperits. 'F I hed me a pint, er mebby a quart o' cider brandy, er ol' Jamacky sperits, I raly b'lieve I'd git so condemned boozy 't I couldn't see aouten the winder—'f 't wa'n't for makin' an' mendin' these 'ere dum'd ol' boots an' shoes, I would, by golly blue!"

"I snum! I sh'ld like ter help ye, Uncle Lisher," said Joseph Hill, smacking his lips.

"'N' it's mos' Thanksgivin' time," Lisha went on; "I b'lieve the day's ben sot by the Gov'ner, haint it? Seem's 'ough I seen it in the last *V'monter*. Jerushy!" He called so loudly and suddenly that it startled all his guests, and again "Jerushy!" with a roar that made the battered stove pipe jingle. "Be you deaf or be you dead?"

"What—on—airth?" asked the mildly astonished old matron as she opened the door just wide enough to let her nose and voice into the shop.

"Gim me that 'ere last paper; I wanter see 'f Thanksgivin' day 's 'pinted. It's eyther in the stan' draw, erless in the cub'd, 'f ye haint got some 'o yer everlastin' yarbs spread onter it in the chahmber."

"Yarbs!" Aunt Jerusha replied from the "house part," where she could be heard wrestling with the refractory stand drawer and then rummaging among papers, "why, good land o' Goshen, Lisher, my yarbs was all dried an' in the' bags 'fore ever that 'ere paper thought o' bein' printed! Naow, seem' 's 'ough you took it to wrap up Miss' Bartlett's bootees in t'other day. O' no, here 't is"—reappearing in the doorway—"I b'lieve, le' me see," 'tromboning' the paper to get the proper focus of her glasses, "October the thirty—yes; here Lisher," groping her way to her lord through the tobacco smoke and rubbish and legs of visitors, and then as through the reek, she began to recognize one and another—"O, hope I see ye well, Mr. Briggs, an' Mr. Hill, Miss Briggs an' Miss Hill, be they well? Turrible spell o' weather we're a hevin' on. Why, haow du you du, Samwill? Be you well, Antwine? an' haow's your womern? My! haow you men du smoke! I can't scasely see who's who. Wal, I s'pose terbarker is comfortin' sech weather for them 'at c'n stan' it, but I never could," and she retreated, tapping her snuff box as she went.

"As if snuff wa'n't terbarker!" Uncle Lisha snorted after her; "Le's see," spreading the paper on his knees and staring at it naked-eyed while he wiped his glasses on his shirt sleeve; then adjusting them astride his nose with unusual care. "Le' me see—'Scott an Raymon' offer —m—m—'Patrick Foster, groceries an' p'visions' (an' hoss rum) m—m—m—'B. Seym'r, hats an' caps an' highest price fer fur'—O, here 't is—'Proclermatiern by the Gov'ner—'Cordin to suthin nuther usage 'n' so f'th, 'n' so f'th, hm—m—m—I du hereby 'pint Thursd'y the twenty sev'mph day o' November as a day o' thanksgivin'.' Wonder what they allus hev it come a Thursd'y for, and Fast Day Frid'y? Dum'd 'f I know. An' 'lection day an' taown meetin' an' the leegislatur' begin settin' a Tuesday. Mebby that's so 's 't the men c'n hev clean shirts on; though the' haint time for i'nin on 'em—more likely it's cause the men folks is fresh f'm the disciplyne o' washin' day, an' more cal'lated to du the' duty. Hm! so Thanksgivin' comes tew weeks f'm nex Thursd'y, hey? What be I goin t' du f'r a turkey, I sh' like t' know? We haint raised none, an' I can't 'ford to buy one, an' I've got tu ol' an' dim-sighted t' shoot one tu a shootin' match—do' know 's the' 's goin t' be one, anyway."

"Yas," some one said, "Hamner 's layin 'aout t' hev a turkey shoot, Thanksgivin'."

"Ya-us," Joseph Hill contemptuously assented, "he's a cal'latin tu hev what might posserbly be called a turkey shoot. He's got him fifteen er twenty leetle teenty tawnty faowls 't he calls turkeys—hatched in August, do' know 's they was fore September, nary one on 'em bigger 'n a cardy bird*—do' know but they be bigger 'n cardy birds, but pliggid little to speak on, an he'll set 'em up forty rod, I do' know but fifty, at a York shillin' a shot! The' haint nob'dy erless it's Sam here, c'ld hit one shootin' a week that fur off. 'N' one on 'em would n't more 'n go 'raound 'mongst tew hearty folks—do' know 's the' 'ld be 'nough for tew. He hedn't ort to set 'em up not to say more 'n fifteen er twenty rod, ner ast over 'n above fo'-p'nce ha'p'ny a shot, at sech leetle teenty tawnty insi'nificant creeturs, an' then he'd make money aout on 'em."

"Hamner is tew narrer, c'ntracted an' peniverous tu be very satisfactual tu his patrings," Solon Briggs remarked. "He is a very parsinumerous man."

"Did ye notice haow Solon's bloat went daown," Joseph whispered huskily, nudging with his elbow the ribs of his neighbor on the seat behind the stove, "when he got them big words aouten on him?" He'll hev one on 'em in him some day 'at'll swell up an' bust him 'fore he gits red on't, see 'f he don't. Do' know 's it'll bust him, but it'll strain his riggin' turribly—yes," he said aloud, in confirmation of Solon's opinion of the unpopular landlord, "he's all o' them. They du say as he waters his ol' Medford rum 'at costs him thirty cents a gallern, an' him a sellin' on't at fo'pence ha'p'ny a glass. Anyways, it's dreffle weak. A man 'ould git draounded in't 'fore he'd git tu feelin' good on't. I guess he would putty nigh."

"Good airth an' seas! I don't b'lieve the critter keeps nothin' but hoss rum. Tew drinks on't clear 'ould knock a feller higher 'n Gilderoy's kite, so it's a massy to them 'at drinks it 'at he does thin it wi' water," said Uncle Lisha, as he generously daubed the edges of the tap with lampblack and oil. "I tell ye what you du, Samwill. You gwup to Hamner's turkey shoot an' git me a turkey—git tew 'f ye'r a minter, an' come t' aour Thanksgivin'. The' 'll be a turkey for me 'an Jerushy, an' one for you—one for us tew an' one for you tew, 's the Irishmun said when he was dividin' the four dollars 'twixt himself an' his tew frinds. Er she c'n hev the necks o' both—she's allus a tellin' haow the necks is the bes' part of a faowl, an' you 'n' I'll take the stuffin' an' what's left. I'll pay for tew shots an' you pay for tew, an' 'f you can't git tew turkeys aout o' four shots you haint the man 't I take ye t' be. What d' yo say, Samwill?"

"I'd a good deal druther git ye some patridges, Uncle Lisher. Dum this blazin' away at a poor mis'able turkey sot top of a barrel with his laigs tied, scairt half to death with the balls zippin' raound him. 'Taint no fun for me. I'd druther go out in the woods an' git ye tew three patridges."

"Well, patridges then," said the shoemaker, "I don't keer, on'y patridges aint ezackly sech reg'lar Thanksgivin' meat as turkeys is."

"But the' 's more meat in one good Tom patridge 'an the' is in the hull flock o' Hamner's turkeys," said Joseph Hill. Then, after a little consideration of this statement, "Wal, I do' know 's the hull on 'em, but half on 'em, say."

"Wal then, call it patridges," said Uncle Lisha, with a sigh of resignation. "We'll go it on punkin pie an' patridges. Will ye git 'em, Samwill?"

"You sh'll hev 'em, Uncle Lisher," Sam said, sitting upright from leaning against the wall, his promise emphasized by the creak of the roll of sole leather he sat upon, "'f the's any in the woods."

"O, the woods is popular with 'em," said Solon.

"I scairt one aouten my woodshed yist'd'y mornin', er mebby 'twas day 'fore yist'd'y mornin', any ways I scairt one aout on't when I went aout arter kin'lin', an' I tol' M'ri on't."

"Proberly the's so much wood in your shed, Jozeff, 'at he thought he was in the woods," said Uncle Lisha, whittling a plug of tobacco on his cutting board.

* Nuthatch.

"Bah gosh!" cried Antoine, who had long suffered with silence, "'f dey don't tick in de hwood! an' he don't 'fraid more as hen was. Bah gosh, t'odder day, seh, when Ah'll was be choppin' in de hwood dey was one of it flewed raght in ma face an' Ah'll bite hees head wid ma mouf! Ah'll peek ma toof more as two nour 'fore Ah'll got de fedder off of it. Bah gosh, Ah'll got all de patridge Ah'll wan' for heat more as dis year, dot tam, me."

"Git Antwine to set his maouth an' ketch ye some, Joseph suggested.

"He'd pizon 'em with his dum peasoup lies," growled Uncle Lisha, as he brushed the tobacco into his hand and began grinding it between his palms. "Say, Samwill, haow was you a-cal'latin' to spend yer Thanksgivin' this year? Naow, 'f yer 'goin' huntin' for me, I want ye t' 'tend right tu yer huntin' an' nothin' else."

There was a roguish twinkle in the corner of the eye nearest the reclining hunter as the old man asked, "Boys, I do' know's I ever tol' ye 'baout this 'ere gret hunter's a-goin' foxhuntin' one Thanksgivin' Day back o' Pur'n'-t'n's, did I?"

"Uncle Lisher," Sam drawled in a slow, impressive monotone, "if you raly want me tu git you some patridges for Thanksgivin', you don't wanter tell no stories baout my Thanksgivins."

"You mean it, Samwill?" Lisha asked, pausing in the lighting of his pipe till the match began to fry the wax on his thumb.

"Sartinly I du," Sam answered.

"Wal, then," said Lisha, "I want them patridges, an' I got t' hev 'em," and though Antoine cried "Tol' it, Onc' Lasha, tol' it! What you cared? Bah gosh, Ah'll know where dat turkey Hamny's roos', an' 'f Ah don't gat you more turkey as you'll heat an' A'n' Jerrushy in four day, Ah'll give you masef for roas'! Ah'll bet you head, boy, dat Sam shoot fox an' he'll ant hit heem!" and though all beset him importunately, the old man utterly refused to tell the story, and presently his visitors departed in as bad humor as they had come. As they separated at the door yard gate to go their several ways, the inquirer turned back to ask, "Say, Jozeff, haow much did M'rier git for that 'ere dawg?" ROWLAND E. ROBINSON.

[The untold story will be given next week.]

CANADIAN GAME AND FISH RESORTS.

Editor Forest and Stream:

In a recent number of your paper I see that you invite travelers and subscribers to send in information relative to hunting and fishing grounds of which they have knowledge, for the benefit of others, the shortness of whose outings will not permit them to spend time in seeking for hunting grounds; and as I have recently returned from an extended tour in the Canadian Northwest, I will briefly sketch the hunting opportunities offered by the various localities in which I stayed. Taking the localities in the order of their proximity to Toronto, first is Sundridge, on the Northern Railway, eight hours due north of Toronto. I did not stay here long enough to do any shooting myself, but gathered what information I could and took special notice of all incontestible tangibilities in the way of specimens and photographs. In front of the Queen's Hotel, at which I stayed (and where, by the way, the sporting visitor will find excellent accommodation, and in Mr. Jackson, the proprietor, a genial and sympathetic host), lies Stony Lake, surrounded by hills, still clad in primitive forests of pine.

As I am no fisherman I can get up but little enthusiasm on the subject, and as the fame of this lake as a trout pond has already been published abroad by your paper, I shall do no more than say that here the keenest piscator my sate his appetite for sport in a single week. I was shown photos of newly caught trout taken "100yds. from the verandah," and was told the weights of various specimens up among the pounds, but I did not make notes. Deer are plentiful almost in the "town." Moose also are found near by, while partridges and other small game are abundant. While I was there a large lynx came out of the woods near by the hotel. I went after him, but failed to get a shot.

My next stop was at North Bay, Lake Nipissing, 10½ hours from Toronto. I spent a day around the locality ascertaining the sporting possibilities of the region, which, by the way, is not by any means of the boreal character that most of us imagine. Through the kindness of Mr. Burke, of the Pacific Hotel, I was enabled to make a general inspection of the country about the town, and was not a little surprised to see what promise of a great future lay in the unlimited stretches of fine rolling land—true, it is at present covered with a heavy growth of timber, composed chiefly of white pine, black spruce, red cedar, balsam, tamarac, hemlock, white, yellow and sweet (*lenta*) birches, sugar maple and swamp elm, with a few oaks and beeches in limited localities, but there is no doubt that many a hopeful emigrant who spent nearly his all in transporting himself and his family to the dreary summer-frosted prairie solitude of Minnesota and Manitoba, within recent years, would if he again had a chance to strike out, hasten gladly to settle in the long hidden though rich loamy lands of the Nipissing water system, where he would no longer feel himself banished from civilized life, and where he would be less persecuted by the climate and better supplied with wood to meet its inclemencies.

North Bay is situated just on the line of demarcation between the respective ranges of the caribou and the Virginian deer. While judging from the heads that I saw the moose also must be plentiful in this region. I was shown the head of what I, in my simplicity, took for some sort of whale; but I was told that it was only a 22lbs. lake trout! Jackfish and speckled trout also are abundant. I once met a New Yorker who had visited the country to the south, some seven years ago; he said that there was simply too much game for sport. In one morning they could catch more trout and kill more deer than they could consume in a fortnight, so he came away only half satisfied and never returned. Certainly the game is much less abundant now in the immediate vicinity of the town, but still Parry Sound District and the shores of Lake Nipissing must be looked on as excellent hunting grounds. For the second essential, guides, I refer visitors to Mr. Burke, and as to hotel accommodations, I do not think that the most fastidious New Yorker will find fault with any of the arrangements or appurtenances of the Pacific.

On the C. P. R., along the north shore of Lake Superior, I stayed at Schrieber, and again at Port Arthur. At both

places the evidence of specimens and information went to show that caribou, spruce and birch partridges (*Canace* and *Bonasa*), fish and fur, were plentiful a few miles back.

My next stop was at Rat Portage, on the northwestern bay of the Lake of the Woods. This country is rated as an A1 fur district in the books of the H. B. Co. In the immediate vicinity of the town there is no game, but guides are easily obtained, and ten miles back various birds, beasts and fishes are common, the following being the chief game: Moose, caribou, hares (*L. americanus*), spruce partridges, birch partridges, prairie chickens (*Pediocetes*, first observed at Port Arthur), and various ducks, etc. From Rat Portage several steamers start weekly for various parts of this great lake, and among their landing places is the Northwest Angle, famous in history and notable as being the most convenient point for reaching the Great Roseau Swamp, which here touches the lake. Of this swamp I need say nothing, its promises as a hunting ground have been sufficiently set forth by a recent writer in this journal.

At Winnipeg, my next halting place, I stayed a week, and was shown elk, moose, caribou and jumping deer (*Cervus macrotis*) heads by the dozen, also hares, prairie chickens and ducks by the thousand. But I did no shooting myself, being desirous of pressing on to my old home at Carberry before I began to burn powder.

Carberry is on the C. P. R., 105 miles west of Winnipeg; 1886 was a great year for game, and the following list will give an idea of the sporting attractions of the locality:

Moose—Not uncommon in the Big Swamp.
Elk—Rare.
Jumping Deer—Tolerably common; becoming more so.
Hares—Enormously abundant; too many for sport.
Geese—Common in fall.
Ducks of all kinds—Very abundant.
Snipe, etc.—Abundant.
Partridge—Common.
Prairie Chicken (*Pediocetes*)—Exceedingly abundant.
Prairie Hen (*Tympanuchus*)—Rare, but becoming more common.

As I am preparing a more extended article on Carberry hunting and have already published an account of one of my own hunts in that region, I shall not enlarge on the subject at present, but in conclusion must warn all prospective tourist hunters that I never yet saw a hunting ground where large game could be bagged without a great deal of toil or where anything worth mentioning could be killed from the hotel windows.

ERNEST E. THOMPSON.

TORONTO, Jan. 30.

A COURSING MEET.

DOWN in the lowlands of Scotland, in a gorgeous smiling farming country, that produces untold bushels of potatoes to the acre and turnips of a wondrous size, that in turn have to do with the evolution into beef of great glossy-flanked Polled Angus and Ayrshire cattle, several hundred men have arrived by train to see the great coursing meet. There are ruddy-faced squires in broad corduroy shooting jackets and leather gaiters, each one enjoying a pipeful of cut Cavendish or even of strong smelling black pigtail. Canny old Scotchmen are cracking heavy and rather indigestible jokes among themselves, and pass around the big snuff-box, and every man helps himself by means of the little ivory spoon, and daintily insinuates into each nostril a charge that would be any other man's death of sneezing, providing he had not had the privilege of having been born north of the Cheviot Hills.

Men are leading about braces of lanky greyhounds, and the lithe and graceful animals seem already to scent the sport, and frequently give their short leash a strong tug, but soon relapse into good behavior upon a word of the master. The owners are of various descriptions, some are hearty, broad-smiling fellows, who evidently run their dogs and stake their money for the pure love of the sport. Others are keen-eyed and cautious-looking men who make a business of it, and do not entirely course for fun. These always take some time to think before they make a bet, and are apt to haggle a little before they enter their wagers in their little books.

The whole crowd walks down the road and through the village, and a number stop for a few moments at the Mac-Something-or-other Arms, and their are loud calls for gills and mutchkins of the best.

Then all are assembled in a broad pasture ground, and the judges on horseback move hither and thither, and ask the crowd to step back, for the wood just opposite is going to be driven. Two names are called and a couple of men step forward, each one leading a hound. The dogs are leashed together and the sport begins. A hare starts from the wood, bounds into the clearing, and is away at a rattling pace. The leash is slipped and the eager greyhounds are after poor puss in hot chase. One of the dogs, a sinewy strong-boned animal, of coal black hue, is very close to her heels in less than a minute, but the hare takes a sudden turn just in the nick of time, and her pursuer's tremendous pace carries him way beyond her before he can turn. The other dog, however, which was a few yards behind, has been able to take a sharp turn too, and does the running now. The hare turns and twists and darts about, but both dogs are after her again. One of them manages to head her off, and she nearly falls into the eager jaws of the other, but he misses his spring and away she goes once more. This time she goes through a wire fence, with both dogs neck and neck behind her, but alas for the big black fellow, he has failed in his hurry to see the treacherous wires, and as he sails along the ground he sharply strikes one of them, and falls into the ditch with a broken neck, while a minute longer pussy meets her death as the other dog catches her after one more turn.

The owner of the dog that has been killed mutters some imprecation against wire fences and sorrowfully picks up the body, but in the meantime another couple are ready, a hare is found and killed after a short struggle.

The coursing goes on, one pair after another, every one is exciting, the accident has been forgotton. The betting grows brisker every moment, five pound notes are changing owners at a great rate, and all look happy except a few that have been hit rather hard in the betting.

At last the prize winners have all been picked out, and the coursing is ended. We all go toward the station, and not a little of the day's fun is enjoyed over again in the train.

FLORIDA BIRD NOTES.

HERONS, EGRETS AND SPOONBILLS.

FLORIDA has long been noted for the abundance of its herons and egrets. Quite justly, too, for they abound here in great numbers. In this locality I noticed the great blue, white-crowned, night heron, the black-crowned, little blue, green, Louisiana and snowy herons, as well as the American egret. On several occasions I saw the great white heron on the coast, but was unable to get a shot.

The great blue heron is common everywhere on the coast, along the rivers, about the lakes and ponds, in fact you will meet it wherever it can find suitable food. It breeds in the State, and about four miles east of St. Marks is an extensive swamp, where I noticed several hundred in February, 1886. I once caught one on an outline in shallow water in St. Marks River. He had been wading around looking for food, and discovering the bait attempted to swallow it, when the gag hook became fastened in his throat. He made things very lively in the morning when I approached him and fought desperately. Another time I saw one on the shore of Lake Jackson that was followed by a large alligator that evidently wanted heron for dinner. The heron kept just out of reach and seemed to pay little attention to the 'gator, but at the same time kept well out of the way.

The white-crowned night heron was seen twice. On March 28 I killed a fine specimen in full plumage at Lake LaFayette, and in June I saw a pair at Lake Jamonia. The black-crowned, like the preceding, was very scarce, only being seen a few times.

The blue heron winters further south and appears at this place the latter part of March, or first of April. They breed in colonies of 200 or more and usually select young cypress trees for this purpose. Near the Natural bridge, on the St. Marks River, are numbers of these rookeries. I visited one on April 10 and found a great many nests that already contained the full complement of three or four eggs. One large rookery there was destroyed by crows, which devoured all the eggs. You will always see crows in the neighborhood of one of these rookeries, and at the slightest opportunity they will devour the eggs.

The green heron was plenty early in April as a migrant, but a few can be found all winter.

The Louisiana heron does not come in any numbers until the middle of May. I never saw them inland, but always on the coast or breeding on some island near the shore. About eleven miles west of the St. Marks lighthouse, is a small island of several acres. The island is but a few feet above the sea, and is covered with a rank growth of rushes and low shrubs. These rushes grew to a height of 6 or 8ft. and then lopped over. So thick were they that they would almost sustain the weight of a man. On these rushes, thus bent over, hundreds of gulls have annually built their nests and reared their young. The persecution of late years has been inhuman. Fishing and hunting parties visit the island almost daily. If incubation has begun in the eggs, they destroy or carry them away, and on visiting the place several days later they find plenty of fresh eggs. I was on the island in June, 1885. There were probably 1,500 gulls around it, but on landing and looking it over carefully I did not find over 40 nests containing young or eggs. This season I found it even worse. On May 16 I visited the island and found no eggs at all. The Inspector of Customs at St. Marks showed me a dozen eggs of the black-headed gull, and stated that he had been to the island the day before, but only got about 100 eggs as some one had been there the previous day and got them all. He had saved a dozen of those marked the nicest and eaten the balance. A month later I was again on the island and found no eggs or young birds of the gull, so I am sure that no gulls reared their young this year on Bird Island, as it is called, which for scores of years has been the breeding place of the black-headed gull. Immediately after the arrival of the Louisiana heron on this island, they commenced constructing their flat nests on the low bushes or on the ground underneath. About 200 breed here every year, but if the persecution continues, they will be obliged to abandon the island entirely.

About two weeks after the Louisiana heron, the beautiful little snowy heron arrives, and what space on the low bushes is not already taken by the Louisiana heron is quickly taken by the snowy. In a few days the shallow nest is completed and the complement of three or four eggs deposited. On the arrival of the snowy heron persecution commences in earnest. Nearly every fisher, sponger or other craft is prepared to kill these birds whenever seen, as of late years they have found out these birds are valuable, for nearly all have seen or heard of the advertisements in northern papers for white heron or crane wings or skins. I went aboard a sloop from Apalachicola one day and noticed very nearly half a bushel of eggs of these herons that were taken on the island. Suspended from the yard arms were several skins of white pelicans and cormorants, and hanging by the broad bill in the cabin was a roseate spoonbill. On inquiry, I found out the heron's eggs formed part of their daily bill of fare, and the skins (what there was of them) were for some parties in Chicago. None of the skins were prepared so as to be of any practical use. I dare say that after the arrival of the snowy heron not a day passes until their departure but what some fisher, sailor, or plume hunter visits the place, and as a result the birds are very wild. By the middle of June the young of the American egret are full grown, and with the parent bird have gone to the sea coast. This island is also their roosting place at night. During the day at low tide they feed on the oyster bars and mud flats, and about sundown they commence winging their way to the island, which by dark is literally covered with them. A few roseate spoonbills roost here nearly every night. Last June I spent ten days in the Apalachee Bay, and collected many fine skins. The reader would naturally think that where such an abundance was to be found it would be an easy matter to procure as many as might be desired; but this is by no means true. Let a boat once approach the island and every bird will at once take wing and alight on oyster bars and other places out of reach. The Louisiana herons soon return and do not seem to care much for the stranger's presence, as they are seldom shot at, but the snowy herons keep well out of the way until he is gone.

I wanted a few of these birds skins very much for my cabinet, and after repeated efforts during the day, I determined to try my luck at night. On the afternoon of June 20, 1886, my companion and I left our camp at Shell Point, three miles east of the island, with our minds made up to stay on the island all night, if necessary, to get some of those tall white fellows. Shell Point is noted for its fisheries, and is located eight miles west of the St. Marks lighthouse. Annually, in the fall of the year, numbers of wagons come from southern Georgia for a supply of fish. Just back of the shore is an immense windrow, half a mile long, of broken shells that have been washed out by the waves of the sea; just back of this windrow is an extensive sand flat, level as a floor. The tide sometimes covers this. It is favorite feeding ground of the snipes. Many a time have I seen acres of it covered with such birds as the sicklebill curlew, willet, greater yellowlegs, red-breasted snipe, ring plover and sandpipers. Here is where the pot-hunter can have a picnic. I don't claim to be that kind of a hunter, but my stock of ammunition being low, and the large camp kettle empty, I took the shotgun one day and went back of the camp, where there were thousands of birds. They took wing and came wheeling by in a cloud. The 10-bore spoke twice and we gathered up thirty-two willet, red-breasted snipe and ring plover. All were fat, as the feeding ground was good. As we pushed our boat from the beach the sight was one worth seeing. The sun was going below the pine trees in the west, the sea was calm as there was but little breeze blowing. All nature seemed to be alive with animal life. About 100yds. from shore thirteen large cormorants go sweeping by in a V-shaped line. A clapper rail, with a brood of six young, scampers from the grass near the water, and running over the shells, is soon lost in the rushes of the salt marsh. Ring plover and small sandpipers by dozens are running along the beach. Back of the camp the loud clear notes of the willet as he utters his *pill-will-willer*, can be distinctly heard, and others can be seen feeding along the water. Flying over the water or beach are a number of least terns, their silky white plumage glistening in the light of the setting sun; there are a few common terns and blackhead gulls flying over the marsh. Further north toward the dark pines, two large eagles are whirling in majestic circles. An osprey has just seized a fish from a school of mullet in shoal water and is bearing it away, but alas, the pirate of the air is watching with his keen eye, and an exciting race follows; the eagle gains rapidly and is soon within a few yards when the osprey drops his prey and the eagle, with a graceful swoop, catches it in his talons before it can reach the earth. Half a dozen ospreys can be seen fishing any time during the day at this point, and their movements are closely watched by the eagles. I have seen the eagle capture his own fish on the inland lakes, but on the coast he prefers to rob the more industrious fish hawk. Half a mile from the shore are seven stately white American egrets busily procuring their evening meal. On an oyster bar near by are three great blue herons and a wood ibis also feeding. Near the bar are a number of brown pelicans flying about and every few moments one will dash with terrible force in the sea, sending the spray and water high into the air as he seizes some unlucky fish. In some scrub bushes near the shore some noisy boat-tailed grakles chattering, a pair of gray king birds, whose nest I have looked for in vain, are pursuing winged insects, and on the top of the tallest shrub that king of songsters, the mockingbird, is making the evening air ring with his clear and varied notes. Such was the scene at Lonely Shell Point that sultry June evening. There are places where more species can be seen at one time, but where can a more interesting number be found?

I have often been told by people living in and about St. Marks that not more than twenty years ago a boat could be loaded with eggs at any of the islands in the bay, and there were myriads of birds there compared with the number to be seen now. Surely if this was the case the work of destruction has been going on at a rapid rate. But enough yet remains to make the place deeply interesting to the naturalist and sportsman. About a mile off shore is a sharpie that has been turtling for several days, and a little further on a schooner with a raft of cedar logs for the mills at Cedar Keys. Away out at sea is a schooner that has just come around South Cape, and near the lighthouse can be seen the sails of seven other vessels making for the mouth of the river. They are the spongers and fishers returning from the sponging grounds off shore. But we can't tarry here, for it will be dark in a few hours and we want to do a little hunting before dark, so turning the prow of our boat westward and hoisting the sail we are soon skimming over the water, leaving a broad wake behind. After going about a mile three large white pelicans are sighted about a quarter of a mile ahead and my companion remarked that one of them would not look bad mounted in a collection. We lowered the sail and took the oars and carefully rowed toward them. We reached within a hundred yards when they took wing. Our firearms consisted of a 10-bore breechloading shotgun and a .22cal. Remington rifle. Two loud reports from the shotgun as we hurled 2½oz. of turkey shot at them, and several shots from the Remington are heard, but all to no avail. They kept on in a straight line out to sea. Half a mile further on are a large number of oyster bars, and on these are some cormorants, willets and four fine sickle-billed curlews, the prince of all bay-birds. These we left undisturbed and we are soon plowing our way under the lea of a long narrow island, and it is just getting dark. Coming from the land are five large birds that alight on the edge of the island a few hundred yards from us, and commence feeding along the shore. By looking carefully we see that they are of the most beautiful species of the South, one that we have tried many times to capture—the roseate spoonbill. The sail is lowered once more and a paddle substituted, and we approached carefully. They seemed to pay very little attention to us so intent were they feeding. To my dismay I discovered I had forgotten all the heavy shot at the camp except the two loads I fired at the pelicans and had nothing but No. 6's. It was too dark for a successful shot with the rifle. They let us approach within 50yds. before flying. As they arose I fired two shots, but to no avail, and we would have to be contented by thinking how near we had come to killing a roseate spoonbill.

From this point we could see Bird Island, which now looked like a great white snow bank rising out of the sea. The herons and egrets could be seen coming from all directions and alighting. Not wishing to go to the island for an hour, we rigged our fishing tackle and tried fishing for a while, but caught nothing but a dozen catfish and a hammerhead shark 4ft. long; he made a lively fight, but was finally captured and lay floundering in the bottom of the boat. Giving up fishing for this time we took the oars and paddled as quietly as possible to the island. A few of the birds were startled, but they quickly lighted. We anchored the boat among the rushes and crept up the bank carefully. It was a sight worth many miles of travel to behold. Every inch of ground seemed to be covered and the birds must have numbered several thousand. I took aim in the bushes, 30yds. distant, and fired two shots. Hastily loading I beheld a large egret circling just over the ones I had shot and another load soon killed it. The birds flew around the island a few moments and then began lighting on the oyster bars, where most of them remained all night.

Knowing that the roseate spoonbills passed over this point about daylight, we determined to stay all night. On going to pick up our specimens we found five large egrets (two adult and three young), six fine snowy herons and two Louisiana herons. Taking the sail from the boat, we rigged it into a low tent under the bushes, under which we carefully placed our birds, and made ourselves a bed of our two blankets. By this time the herons that had nests commenced returning and taking their places on them. These we did not disturb as we had the specimens we so much desired. We were awakened once during the night by the tide rising and wetting us to our knees. H. A. Kline.

Forreston, Ill.

Gun or Field-Glass?—Milford, Mass., Jan. 28.—In the *Scientific American* of Jan 22, an article by E. M. Hasbrouck on "Our Warbler," is a strong plea indirectly for the formation of Audubon Societies. He says, "I wonder how it is that men can be so wrapped up in this world as to be insensible to the presence of the many beautiful forms in nature that surround them, and are intended to cheer them on their path through life." This beautiful sounding sentence is given as a thought passing through his mind while watching a beautiful black-throated green warbler (*Dendroica virens*). Then immediately follows, "To become acquainted with these beautiful creatures one should go into the woods about the first of May *and search them diligently* (italics are mine); *take a small gun with you.*" There is no need of further quoting; let the reader supply the rest. I should think it was a pretty good way "to become acquainted with the many beautiful forms in nature intended to cheer one on the path of life" to "search diligently about nesting time with a gun." Nature probably intended these beautiful songsters to cheer one through life about this way. Further on in the same article Mr. Hasbrouck refers to the Almighty and his wise care that provides for the safety of nests and eggs, and yet in the same breath he advocates the wanton slaughter of the parent birds, without which the nests and eggs will be worthless. Shame on any advocacy of shooting these beauties in May. If they must be taken sparingly for science, let it be when all feelings of humanity are not shocked by the murder of the innocents. My plan gives more satisfaction in studying nature. When you go out take, instead of a gun, a good field-glass, and instead of pointing the deadly gun at the birds to kill them, focus the glass on them and enjoy their innocent ways, watching their search for food and playful antics. Many is the hour I have passed watching and studying the little wood folk, and they have been none the worse for my presence. Noted in this way they do indeed "cheer one on his path through life."—Sumner.

Hawks and Owls.—At a recent meeting of the Pennsylvania State Board of Agriculture, B. H. Warren, of West Chester, delivered a lecture on "Food Materials of the Hawk and Owl Tribe," after which there was a free discussion as to the merits of the scalp act. Last year there was expended in bounties for scalps of animals about $100,000, 60 per cent. of which was paid for hawk and owl scalps. A vote was taken at the close of the meeting, with an almost unanimous result for the repeal of the entire act, and a resolution was adopted in accordance with the sentiment, asking the Legislature to wipe it out.—Victor M. Haldeman.

THE TERNS OF MATINICUS ROCK.

Editor Forest and Stream:

Being a constant reader of your vauable paper, I was surprised, not to say displeased, to see in the edition of Jan. 13 a communication headed "The Terns of Matinicus Rock." If you wish for particulars in regard to the shooting of the Medrick gulls or terns there, I think it no more than right that you should have the true particulars. As I am the C. E. Cahoon referred to, and as the article attacks, not only my business, but my honor and humanity also, I hope you will allow me space to vindicate myself and correct some of the misstatements made. My business at present is collecting bird skins, for both scientific and millinery purposes. However, I never discriminate between the different orders, but always send perfect made skins, and never send the breasts as Mr. Grant would infer. As long as the people demand bird skins I shall probably make collecting my business; and as long as I never kill or collect either insectivorous, song, or game birds, I do no not see how I can consistently be found fault with. I pay attention to the tern entirely. This bird, as all naturalists know, is of no use whatever except for decorative and millinery purposes, being neither insectivorous nor a song bird. In nature's economy it is a destroyer, feeding entirely on young food fishes, such as the mackerel, bluefish, etc., which it destroys in large numbers. Mr. Grant's communication would lead your readers to believe that I used wounded birds for lures, and left the young to die of starvation, etc. The insinuation is base and false, and I am sorry that such testimony should come from the hands of an honorable and respectable man like Commander O. A. Batcheller. In denial, to begin with I did not go to Matinicus until the terns had finished breeding, and I did not "give out" that I was seeking recreation, "and only wanted a few birds to stuff." I went about my business and had the hearty co-operation of the good people of Matinicus. They certainly made it very pleasant for myself and wife, and offered me the loan of their boats. Several of the men and one young lady worked for me while I was there. As to Mr. Grant, he invited me to come there, and said he did not care if I killed all the birds. He writes, "The people tell me that he entirely exterminated the birds from Seal Island, Wooden Ball and Green Sedge, before he came to the rock." This is a falsehood. One of the islands spoken of I did not visit at all, and the terns were seemingly as thick when I left the other as when I came. I have knowledge that "the people" did not tell him so. If the terns are protected during breeding time, extermination is an impossibility. I will guarantee that Mr. Grant's boys killed more young birds by stoning, than I did of the old by collecting. When Mr. Grant says, "he would get eight or ten at a shot," he shows a lamentable amount of ignorance and an overgrown imagination. Mr. Grant never threatened me with the law, and as I knew the law on the subject before I went there, he could not have troubled me any if he had. The gentleman who followed me down, was a well-known collector, who wished to buy some skins for scientific purposes, and the "taken for debt" part was a malicious fabrication of Mr. Grant. If you wish for true and full particulars concerning the shooting of gulls at Matinicus, I can give you a full and comprehensive report, with the aid of my diary. The people of Matinicus will uphold me in my statements, and I have proof for all I have said. If I hear further from Mr. Grant I will (with their help) endeavor to enable you to see for yourself what his testimony is worth. I regret that Commander O. H. Batcheller should have received so disreputable a report of me. C. E. Cahoon.

THE NATIONAL PARK BILL.

Following is a copy of a letter from W. Hallett Phillips, Esq., some time special agent of the Interior Department to report upon the Yellowstone National Park, to the chairman of the House Committee on Public Lands. The letter gives a concise and perspicuous summary of the reasons for adopting the bill S. 2,436, now before the Committee:

Washington, D. C., Feb. 8, 1887.

Hon. T. R. Cobb, Chairman of the Committee on Public Lands:

Dear Sir—Referring to our interview on the subject of the Yellowstone Park Bill, it may serve some advantage to state shortly the main reasons why the bill should become a law. The act of 1872, organizing the Park, gave the control of it to the Secretary of the Interior, upon whom was conferred the power to make regulations for its preservation. Strange to say no jurisdiction was conferred upon any tribunal over the Park, nor were any penalties prescribed for the violation of the regulations. During the years immediately succeeding the passage of the organic act, as the travel to the Park was small, these omissions in the law were not much felt, but as soon as the Northern Pacific Railroad was completed to the Park, the tide of visitors commenced to pour in, until now between five and ten thousand persons visit it annually. The necessity of some jurisdiction to punish offenses within the Park has become imperative, and unless the requisite legislation is had at once the Park will soon be in such a condition that there will be nothing left worth protecting. In my report on the Park made to the Secretary of the Interior in January, 1886 (S. Ex. Doc. 51, 49th Cong. 1st Sess.), I called his attention to the urgent need of Congressional action to afford some judicial machinery by which order could be enforced in the Park and offenses against person and property punished. In his first annual report the Secretary points out the fact that the Park could not be protected unless action in the premises was taken by Congress.

In his report, made at the present session, he says: "While the acts of Congress confide the care and control of the Park to the Secretary of the Interior, and confer upon him the power to make rules and regulations, no penalties are provided for their violation, nor is it clear where the jurisdiction over crimes committed within the Park resides. For all practical purposes, it is a Government reservation, and the laws of the United States governing such reservations should be extended over it. It is certainly unfair that the people shall be invited into a Park set aside for their benefit and enjoyment by the national laws, and yet find when they reach it, no adequate protection for their persons or property. The bill unanimously reported from the Committee on Territories of the Senate during the last session of Congress, I believe to be well constituted for the object in view. This or some similar measure should become a law during the present Congress, if it is proposed to preserve this Park for the purposes covered by the original act."

During the past season men were arrested in the Park for setting fire to the forests, killing the game and injuring the wonderful formation around the geysers, and yet all that could be done was to order them to leave the Park, and they were left at liberty to return and renew their devastations.

The bill now before your Committee was carefully framed and considered by gentlemen who have given much thought to the subject. It received the approval of the Senate by the very unusual vote of 49 affirmative to 8 negative votes. The Chief Justice of the United States, who has always manifested much interest in the Park, having twice visited it, in a recent letter says: "I have read the Yellowstone Bill, and it seems to meet the requirements of the case. To accomplish what is needed, there must be a government, and I do not see how any less than is provided for can be made sufficient. If it is worth while to have the Park, it is worth while to see that it is preserved for the purposes for which it was intended. It should be either abolished altogether and be permitted to go into the hands of private owners for the purposes of extortion, or else it should be kept as a national institution and cared for as such."

So much for that part of the bill as deals with the administration of justice. The other point to which I desire to call your attention is in regard to the boundaries of the Park. When it was established by the Act of 1872, there was a very indefinite description of its boundaries. The boundary lines of the adjoining territories were not then surveyed by the United States. The boundaries as established by the bill under consideration, have been fixed with the approval of the Interior Department so as to have the whole Park within the limits of Wyoming, whereby the criminal jurisdiction of that Territory might be established over it. A narrow strip to the North, about two miles in width, has been given back to Montana in order that the Montana line should constitute the northern boundary. To the south, some eight miles has been added, and to the east, a lofty mountain range, with peaks rising from 11,000 to 12,000 feet in altitude, has also been added. The object of these additions has been to increase the great forest preserve—the most important object of the Park—and to protect the game which abounds in the mountains. The country is wholly unfitted for agriculture, and as shown by the reports of the geological surveys, is destitute of minerals. There are no settlements to be found there. It may be added that a bill substantially the same as respects boundaries with the one now before you, passed the two Houses at the last Congress, but failed to become a law by reason of the failure of a conference committee to agree on an amendment adopted by the House of Representatives. The bill came from the Senate. The amendment cut off from the Park a large section of its northern portion and made the Yellowstone River the boundary. The object was to allow the right of way to the Cinnabar & Clark's Fork Railroad. As the House at the present session has refused by a decisive majority to permit the railroad to enter the Park at the point indicated, I take it for granted that they will not sanction that any portion of the Park should be cut off for the same purpose.

In conclusion, I beg leave to append for the information of the committee, a letter written by Mr. Arnold Hague to Senator Manderson. Mr. Hague has had charge for many years of the United States Geological Survey of the Park, and from his long experience of the country can speak with more authority on the subject than any one I know of.

If your committee should wish any additional information I will be very glad at any time to furnish it.

Respectfully yours, W. Hallett Phillips.

Editor Forest and Stream:

Friends of the National Park must necessarily be pleased that the Senate has appreciated its worth and importance, and that a healthy reaction has set in as regards legislation toward preserving to the people what I may modestly venture to assert is the Switzerland of America. But the end is not yet. We are oppressed by a fear that Senator Vest's bill may not pass the House. I would therefore suggest and urge the importance of concerted action, of personal appeals to Congressmen and a thorough ventilation of the subject through the press by those lovers of the Park who have been there and can wield a fluent pen in its behalf. The little I can say may not be of much practical use, but if each one will throw in his mite a mass of popular opinion may be produced so strong in its character that Congress may be influenced to devote a small, yes, in comparison with the stupendous blocks of our surplus which Congress is lavishing round, a very small sum of money and the much-needed legislation. I am not going to say anything about the many natural wonders, the magnificent scenery, the delightful and bracing air of this elevated domain, they are self-evident facts to the many who have enjoyed them; but I do wish to call attention to the preservation of large game, and to the possibilities, nay probabilities of great future increase, which must follow an assured National Park, providing proper protection to those animals whose instinct has driven them as a last resort within its boundaries. Sportsmen, bear this in mind, for I am firmly convinced that for the future hunter, whose sole object is not a wanton and disgusting slaughter for heads, but such an one to whom the delights of camp life, the scaling of rocky heights, the noiseless stalk in the unbroken solitude of some great pine forest, the faithful shooting pony, his companion for many a day and many a weary tramp, the genial glow of camp-fire fragrant with appetizing fumes of broiling steaks, the result of prowess within bounds—for such an one I repeat, the Yellowstone National Park means everything. Game will breed there, will multiply there, and naturally will overflow, and of this latter the future sportsman will partake sparingly if he is a manly fellow. Urge, therefore, upon your Congressman the importance and humanity of passing the bill; explain to him the frightful slaughter, the almost absolute extermination of some of our wild animals, bid him think twice before he condemns all to the same fate. Tell him the Park has plenty of game in it, that twenty men of the right sort can easily, for a small outlay, protect and guard all the Park contains. Wake up, brother sportsmen, cast aside your natural modesty and pitch in before it's too late.

Archibald Rogers.

Hyde Park, N. Y.

Editor Forest and Stream:

At a regular meeting of the Sherman Gun Club, of Columbus, O., Jan. 20, the following preamble and resolutions were unanimously adopted:

Whereas, The National Government, in its wisdom, set aside a large tract of the public domain as a perpetual natural national reservation, and called it Yellowstone Park; and as yet no adequate laws have been enacted which will secure the proper protection for the numerous species of fish and game and the many objects of scientific interest and value within its limits; it is, therefore,

Resolved, That Senators and Representatives of this State in Congress are earnestly requested to use every honorable means to secure adequate and proper protection to all pertaining to Yellowstone Park, the people's museum of natural wonders.

Resolved, That the Sherman Gun Club of Columbus, Ohio, heartily join the Waltham (Mass.) Farmers' Club and the Massachusetts Fish and Game Protective Association in calling the earnest attention of members of Congress to the bill reported by Senator Manderson from the Committee on Territories, May 17, 1886, for the better government of Yellowstone Park, and designated as Senate Bill No. 2436;

Resolved, That the secretary of this club be requested to send to each of our Senators and Representatives in Congress a copy of these resolutions.

It may be well to say in these days of making and unmaking Presidents that the Sherman Gun Club is not a political organization, but named in honor of Josiah Sherman, who was one of the principal originators of the club, but has long since gone to the happy hunting ground. P.

Columbus, Ohio, Feb. 7.

Narrow's Island Club.—Currituck Sound, N. C.—Game, such as canvasbacks, redheads, common ducks, snipe, swan, and geese, was unusually plenty on the club preserves the season just closed. The scores were generally good; one member, Mr. F. J., having a record of over 80 geese and 600 ducks of all kinds. But it is not all of hunting to hunt. The home-like conveniences (I might say luxuries), the health-giving open air exercise, the jolly after dinner relaxation in the spacious club-room, where billiards, whist and reading rule the hour, go far to make such a relief from overwork a renewal of health and vigor with the sport and game thrown in.—D. W. C.

A Quail Problem.—Edenton, N. C., Jan. 2.—Two persons go for a two-days' tramp among the quail. Number one shoots a 12-bore gun, number two a 16-bore. The first day number one bags fifteen birds; number two twenty. Second day number one gets fourteen and number two gets ten birds; and they shoot one together. Total score, sixty birds in the two days. They hunt two dogs, keeping together, and dividing all doubtful birds. Number two shot a few more shells than number one. How many extra shots was number two entitled to on account of the smaller bore gun?—W.

WISCONSIN DEER HUNTING.

Editor Forest and Stream:

In the fall of each year the western part of Wisconsin swarms with hunting parties from all parts of the country, who, knowing the ground from previous experience, or attracted there by reports from sportsmen who have preceded them, came equipped for from three to eight weeks of roughing it in the pineries. Of all points in the northeastern part of the State, Florence is probably made the starting point for the greatest number of deer slayers, that is to say the most important place of all these, where the conveniences of railroad travel are abandoned and teams taken for transportation to remote and isolated camping places in the wild woods. It is, doubtless, not an over estimate to say that from this place alone last fall between one and two hundred hunters started to try their luck in the haunts of Wisconsin's most noble game, and that each one was rewarded with at least a fair share of success. In no other place can a more hospitable set of people be found. Notable among these who are always ready to welcome genuine sportsmen is C. S. Osborn, of the *Mining News*, who is an excellent hunter, and who knows the country so thoroughly that he can and does give advice willingly as to where the best grounds are to be found.

Last fall your correspondent, with four Fond du Lac gentlemen, hunted ten miles southwest of Florence, between Sea Lion Lake and the Pine River, and succeeded in securing fourteen deer in four weeks. An Ohio party three miles north of us shot sixteen. Three Wisconsin men about the same distance north shot six in ten days, and two novices, who were poor shots, killed three. A noticeable feature of the hunting was the predominance of old bucks, as of the deer killed by our party all but four were bucks, one weighing dressed 208lbs.; another 192 and a third 185lbs. The Ohio party shot but one doe, and the other hunters in our vicinity killed nothing but bucks. Reports from other hunting parties around Florence were to the same effect. This peculiarity is accounted for by the fact that wholesale slaughter of does and fawns is carried on during the summer by headlight hunters who haunt the lakes. In fact, a resident informed the writer that the previous summer he and partner during July, August and a part of September, had killed nearly 200 deer for their hides, and that they accomplished this by using headlights and consuming a barrel of salt in making salt licks. His statement was corroborated by a settler, and during our hunting we found quite a number of skeletons about the woods where the fellow claimed to have hunted. The result is that where deer were so plenty three years ago that during a two hours stroll through the woods five or six deer could be seen, a day's tramp will often be rewarded by the sight of not a tail. Market-hunters also fill the woods during the fall, and it is estimated that in one year recently the Northwestern road alone in Wisconsin and Michigan handled in the neighborhood of 10,000 venison carcasses.

The deer are so rapidly being exterminated that this winter a strong attempt will be made to have the shooting season shortened and competent game wardens appointed for different sections of the State. At present northern Wisconsin, with its majestic forests of pine and hard wood, and its lakes and streams abounding with trout and bass, is almost a hunter's paradise. If action is not taken, however, to correct the evils mentioned above and to abolish the trading posts, where pot-hunters and Indians find a ready market, deer in Wisconsin will soon be almost exterminated. C. R. BOARDMAN.

OSHKOSH, Wis., Jan. 17.

MAINE GAME SUGGESTIONS.

A VETERAN sportsman of the Maine woods and waters called upon me to-day with the view, as he put it, of seeing if he could not do some good. He has visited some parts of the Maine wilderness every year for some twenty-six years, and is a true lover of what Dame Nature has done for the best good of the sportsman who knows how to see and use her gifts. He believes most thoroughly in the protection of both fish and game, but not in the artificial propagation of fish. In this latter respect he does not believe that it is possible to improve upon nature. He believes in the most thorough protection of the trout on their spawning beds. For this reason he would have the close season on trout and landlocked salmon begin Sept. 15 instead of Oct. 1, as now. He would make this change because of the great numbers found on the beds before the end of September; where on no conditions should they be distured. His idea is that it is not possible to take the trout about ready to spawn and, as he terms it, "commit an abortion upon her" with perfect success. He believes that offended nature will show her revenge somehow. Either the young thus brought into the world will be dwarfed, or they will, after being put into the water, prove incapable of taking care of themselves, since they will lack the strength of the little trout hatched in the stream naturally. He would have the money that is now being spent in artificial breeding put to the better protection of the trout in their natural breeding places.

On the game question he is a strong protectionist. He would, however, put the beginning of the Maine open season on deer and caribou back to Sept. 15, instead of Oct. 1, as now, in order that the sportsman might "drop the rod and take up the gun," though he is of the opinion that the deer and caribou need all the protection that is now granted to them. But he would extend the open season only to Dec. 1 instead of to Jan. 1 as now. On the moose question he says that "the close time should be extended from Jan. 1, 1887, to Jan. 1, 1897. They should have the freedom of the forest unmolested for 10 years; anybody killing one should be punished both by fine and imprisonment. The noble moose is rapidly disappearing, and unless this protection is granted, it will not take more than 10 years to exterminate the race." He believes that this extra protection is necessary on both fish and game for the reason that the railroads are gradually entrenching upon the game territory, and that year by year it grows easier and more easy to reach the fish and game regions; that the sporting fever is spreading; that there are already more sportsmen than fish or game. Above all he would inculcate into the ideas of guides the value of deer on the hoof and trout in the water, their value to the guide himself, to be used as lures to draw the sportsmen. The open season on partridges he would not have begin till Oct. 1, since the young birds are not full grown till that period, and because they follow the mother bird nearly all that month, are in flocks, and it is but the work of the merest novice or pot-hunter to bag the whole brood.

As to local game wardens in that State, our veteran sportsman does not believe in them at all. They are hampered to utter inefficiency by their neighbors. It would have to be a greater crime than the taking of a trout out of season or the killing of a deer when the law says no—a deer which is perhaps divided among the neighbors, even Mr. Local Warden himself getting a slice—to make a man complain of his neighbors. This gentleman of much experience in the Maine woods, as well as Maine neighborhoods, would have a system of paid game constables, whose duty it is to see that the law is enforced. They should be located nowhere, but be sufficiently plenty to drop in upon the lumberman or the market hunter at any time. The time of their coming should not be known, but they should be liable to pay the trout-hog or the market-fisherman a visit several times a year. These game constables should be the most thorough woodsmen to be found in the State. They should be selected from the ranks of the guides even by the Fish and Game Commissioners. The best of these men should be selected, and the State should make it an object for them to turn game protectors. Their pay should be such that they would enter into business with the will that they sometimes display in evading the game laws, but their appointment should extend only during good behavior, and their fitness for the position should be determined by the number of the offenders they were able to bring to justice. SPECIAL.

The chances are said to be really excellent that the Libby bill, so-called, introduced by Senator Libby, is likely to contain the main features of all the changes which are to be made in the Maine game laws this winter. In the main, the bill is patterned after the recommendations of the Commissioners in their biennial report. In the first place, the new law will, if passed, make it a fine of $500 to kill, or have in possession at any time, the hide or any part of a cow moose. To hunt moose, deer or caribou with dogs is to be punished with fine and imprisonment. Any person owning or having in possession any dog for the purpose of hunting deer forfeits not less than $2 nor more than $100. Any person may lawfully kill any dog found hunting moose, deer or caribou. The bill adds the month of September to the open season in which bull moose, deer and caribou may be lawfully killed, but does not open transportation for such game out of the State. It makes the attempt to transport it in the close season punishable by a fine of $100 for each and every bull moose, and $40 for each deer or caribou. A law like the above I have heard highly commended by some of the best sportsmen who visited the Maine woods. There is some growling about it, to be sure, but this feeling comes from those who desire to take their dogs into the woods with them. The proposition to open September to the hunting of bull moose, deer and caribou, is being received with a good deal of favor. In short, it is making friends for the game laws of that State. As it now looks there is not the ghost of a chance that the law to permit the hounding of deer in Maine will ever get beyond the committee. Indeed, there is a deal of mischievous legislation proposed by the enemies of fish and game protection in that State, but it is of no use. The die is cast! There has been too wide a step in the right direction in that State for a few disgruntled poachers to succeed in making such radical changes. But still, as the friends of wholesome game laws are well aware, they need a good deal of sharp watching. As Commissioner Stillwell once remarked, "I have no love for such poachers; they would kill a partridge on her nest if the opportunity offered." SPECIAL.

A Monson, Me., correspondent writes under date of Feb. 2: For three years we have been aware that a nest of poachers were located in Elliottsville plantation every winter who slaughtered deer, but each time that we have heretofore attempted to ferret them out they have escaped us. This year our society determined to punish them if possible. We have employed Warden Tripp, who has done his duty very faithfully. The result is that on Tuesday two men were sent to Bangor jail for killing deer. Yesterday Tripp seized the hides of five deer. He found old pieces of deers' feet and other evidence of the killing of several more. This was at the notorious "Doctor" Brown's cabin. One Bodfish is also in for one fine. I think Bodfish will pay rather than go to jail. Brown may go to jail. Both may appeal; but in any event we have broken up this nest of Elliottsville poachers.

WOGDEN.

Editor Forest and Stream:

In a recent number of your paper a correspondent asks for information about "Wogden."

It is the first time that I ever saw the name in print, but as no one else so far as I know, volunteered any information in reply, I will say that Wogden was one who, more than a century ago, had achieved celebrity as a maker of firearms.

During the war of the American Revolution a party of Federal troops under the command of General Dearborn, who, by the way, was a friend of Washington, intercepted and killed Sir Francis Somebody or other, a bearer of dispatches to the British commander. The baronet's pistols were retained by the General as a trophy, and many years ago, when a guest in the family of his son, General H. A. S. Dearborn, of Roxbury, Mass., I used to see them hanging among other curious arms in the library. The younger general was the same who gave his name to the fort where Chicago now stands.

These pistols bore engraven upon their silver butts the initials of their then owner, H. A. S. D. They were horseman's weapons, of moderate size for the time in which they were made, silver-mounted, iron ramrods, finely finished, and with flint locks, of course. On the barrels was the name "Wogden."

I last saw these arms a few years ago in the possession of Mr. H. G. R. Dearborn, of Roxbury, to whom they had descended. He told me that they were very accurate, and added that Wogden was the Joe Manton of his time, as he inferred from having read in an old novel a description of a duel, which stated that the principals were "prepared with Wogdens."

Your correspondent has an interesting relic of the olden days. KELPIE.

CENTRAL LAKE, Mich., Jan. 31, 1887.

ABOLISH SPRING SHOOTING.

SYRACUSE, N. Y., Feb. 2.—At the meeting of the Onondaga County Sportsmen's Club last evening, this resolution was adopted: Whereas, After careful investigation we find that the shooting of wildfowl and other migratory game during the spring is rapidly diminishing our game supply and driving the birds from the breeding places, Resolved, That we unanimously deprecate the practice and that we use our personal influence for the protection of game during the spring migrations. Resolved, That we send a copy of this memorial to the members of the Legislature and earnestly petition that a law be passed abolishing the shooting of all game during the spring.

Editor Forest and Stream:

I observe your note entitled "What Folly!" While I am in favor of all protection for game and fish, I do, like many others, object to being cut off from the most of our shooting, while the wholesale slaughter goes on in the South and the 50,000,000 of eggs are shipped from the North. Let the evil be righted where it will do most good. The Monmouth Club mentioned (with whom I am personally acquainted) are perfect gentlemen who are as earnest in all laws for the benefit of game and fish and the people who enjoy such as "C. C. P." can be. They feel, no doubt, just as they stated in a circular which accompanied their petition, which I and others here received and worked for. Trusting that "C. C. P." and others will look at this matter in a correct light, I am with you for protection. GEO. R. MERRELL,
Sec. New Boston (Ill.) Gun Club.

Editor Forest and Stream:

Every true sportsman must plainly see that if spring shooting is allowed to continue for the next ten or fifteen years, many of our game birds, which can now be seen at certain seasons in enormous flocks, will then be as scarce game as the bison is at present. The birds which I refer to principally are the many varieties of ducks, geese and brant which frequent our coast and inland lakes and rivers, some of them all the year round and others the greater part of it. As the law now stands these birds have only about four months out of the year free from persecution. From the time they start on their southward migration until they arrive on their northern breeding grounds.

There are many men who plead that business compels them to go shooting, if at all, in the spring. It may be possible that some are unable to leave business, but I think that if the law prohibited spring shooting many who now shoot in the spring would find time and means to take their vacation in the fall instead of spring. The very same men who shoot both spring and fall are often the loudest to cry down the market-shooter, who shoots for his living during all of the open season, but who can blame him for carrying on a business sanctioned by the law, and when he does it as a means of existence, while others are doing the same thing for pleasure only. If these birds were protected during their northward migration in the early spring, both sportsmen and market-shooters would be equally benefitted by the increase. Of all our game birds there are none that, if properly protected, will increase as rapidly and give as much sport as the ducks, geese and brant which now fairly swarm along our eastern coast. If a law was passed and enforced in most of our Eastern States prohibiting spring shooting, they can be preserved in fairly large numbers for many years to come if this law is adopted. C. N. B.

Editor Forest and Stream:

I read in a recent Chicago daily that notice had been served on the United States and American Express Companies that they must not carry game out of season. While many censure the companies for carrying fish and game during closed season, allow me to say—and I know whereof I speak—that the instructions to their agents are against any act which is contrary to the laws of any State in which they operate. While we must admit that some rules are broken, it is done without their knowledge or consent. It often happens that the agent is innocent, and in such cases, like the company he represents, he is free from guilt. Our State Legislature is in session, and no doubt the subject of prohibiting spring shooting will be taken up. A daily of last Saturday contained the following: "An East St. Louis man wrote Mr. Messick, Representative: 'For God's sake try and kill the bill forbidding spring shooting and crown yourself with glory.'" No doubt the gentleman from East St. Louis is a person who cannot hunt at any time but in the spring, but the chances are stronger that he is some pot-hunter from St. Louis. Whoever he may be, he can get all the shooting he need take any spring from the Mississippi River. He has an advantage over us who live in the center of the State, and his appeal should not have a feather's weight of influence. I will guarantee that Mr. Messick will be crowned with more glory in helping to stop the slaughter at a time when the game is not fit to eat and when there is no demand in the market, than by opposing a popular sentiment among the largest-hearted people of our land. We must not forget that the spring time is the breeding season of all our game, and who could count the thousands more there would be in the fall if the game were left unmolested in the spring. The argument is advanced that the ducks do not nest with us. We must admit that fact, for it is practically true at the present time, but it is no fault of the ducks. With an open shooting season the poor birds get no chance. In this latitude mallard, teal, and woodducks would nest on our prairies and creeks if they were not killed off while trying to build their nests.

Allow me to thank you for the manly stand your good paper always takes on these subjects. I feel that the saying is still true, constant dripping wears the stone away. Shooting with us has been lessened by the severe weather this winter. Last fall this part of the country afforded no shooting, excepting jacks, which were never known to be in such numbers. A party went from here to one of our resorts duck shooting, and did not shoot enough to supply the table. There is no accounting for this unless it was caused by the dry season. Our gun club is in a prosperous condition, and has its share of good shots, who enjoy their Saturday shoots. NIMROD.

PENETRATION TESTS.

Editor Forest and Stream:

I have heard a great deal of discussion regarding the penetrating power of shells loaded in certain ways, and to satisfy myself I made some experiments this afternoon, the result of which I give to your readers:

2½ drs. powder, 5 thick wads, 1 oz. shot, 1 thin wad..... 50
2½ drs. powder, 4 thick wads, 1 oz. shot, 1 thin wad..... 70
3 drs. powder, 3 thick wads, 1 oz. shot, 1 thin wad 85
3 drs. powder, 2 thick wads, 1⅛ oz. shot, 1 thin wad..... 75
3¼ drs. powder, 2 thick wads, 1⅛ oz. shot, 1 thin wad 90
3⅛ drs. powder, 2 thick wads, 1⅛ oz. shot, 1 thick wad.....120

The gun used was a 12-bore W. & C. Scott & Son, 7¼lbs., modified choke, at 30yds. The outside figure refers to the number of pages perforated of a Government Agricultural Report, about 50lbs. calendered book. The powder was Laflin & Rand No. 3 Eagle Ducking, and the shot No. 8 drop. The experiment showed that the wads have very little to do with penetration, and that powder is the main thing. I think the result would have been better had I fired a charge of 3½ drs. and only an ounce of shot. After this experiment I tried one shot with No. 1 shot, 3¼ drs. and 1oz., and perforated 170 pages of the same book, all the shot put into it flattening. J. M. W.

Augusta, Ga., Feb. 2, 1887.

HUNTING HARES IN CALIFORNIA.

It is the exercise of skill, tact, nerve and judgment that brings delight to the true sportsman in pursuit of game; hence there is little real pleasure in bagging game that does not call into requisition these acquirements. True he may get the exhilarating benefits of the tramp through field, forest and glen, and listen to the "sermons" nature preaches in "stones" and in her "running brooks," and these undoubtedly will make him a better man morally, mentally and physically; but the zest and keen enjoyment of shooting arises from pursuit of game that is fleet of foot or swift of wing. To bag game requiring no skill in its capture is much like murder in the first degree, or robbing from nature's great market without any adequate compensation.

The hares of California can be slaughtered in this way, but when properly hunted will afford keen and lively sport. They are quite plenty in the lower foothills, flats and valleys of the Nevada Mountains, keeping generally in the sparsely timbered sections, seeking for cover the tangled chapparel or manzanita. They are less frequent in the higher timbered region, generally keeping below the deep snow line. When found in these sections, my experience has been that they are somewhat larger than those found below. I have weighed one turning the scales at six pounds, and think I have seen them that would have weighed much more. To me they are not inviting food, being somewhat rank and not tender unless par-boiled thoroughly before cooking in any manner for the table. A dish once or twice during the fall or winter may be acceptable, but oftener than that one becomes tired of it. There is little trouble in shooting them after the fall rains, when the grass has started fresh and green. One need only go quietly and take a station beside the cover and near a grassy spot, when, as the sun goes down, they will amble out for their evening meal, and can often be picked off with the rifle or shotgun; but this affords little pleasure to one who is willing to give game a fair chance for its life ere taking it. In hunting quail your dog will occasionally start a hare from his cover within gunshot, when, if you care to take so big an incumbrance, you can blaze away at him.

But the only real sport in hunting the hare is derived while hunting him with a dog and on horseback. One moderately fast running, good trailing hound, and two men on horses that are not gun-shy make up the party that suits me. The horses are convenient in going to and from the hunting ground, and also in going from one point to another to gain a position where the hare is likely to pass while being driven by the hound; and from the elevation of the saddle one can get a better view of the slight openings and cattle paths among the thick cover in which one must be prepared to make his shot as the hare in his flight presents himself for an instant—and, if one has any luck in bringing his game to bag and desires to take it home, he will find that he can do it much easier while tied to his saddle than when strung on his own shoulder. For these reasons I generally did my hare hunting on horseback. When the hare is once started the real sport begins, and he will lead your dog as lively a race as his speed may dictate, always finding an "extra link to let out" whenever occasion requires, or he is hotly pursued by the dog. No foxhound can worry him seriously, and the ground is generally unsuited for the fleetness of the greyhound. The hare will wind about from ridge to ridge, much like a fox when pursued by hounds, but will never strike off from the point of starting more than a quarter or half a mile, and his locality and course can generally be determined by the baying of the hound. If you judge that he is making for a certain point put spurs to your mustang and get there before him; and if you get a sight of him, even for a couple of bounds, let him have "the best you have got in the shop," for the next instant he will be hidden in the dense cover. Quite likely you will be a little late in getting to your position and a glimpse of your game may require you to do your shooting while your pony is on the run; or the hare may have heard the tramp of your horse and dodged in behind you, causing you to turn in your saddle and give him a stern shot like a fleeing ship. It requires quick shooting and no little skill in the saddle to meet with success, but it is lively and enjoyable sport.

I once had a little excitement for which I was not entirely prepared, and which afforded my companion the best end of the fun. My friend, Tom B., a Missourian, good fellow, excellent shot and expert horseman, started out with me one day to ride about four miles where there were plenty of hares, in a comparatively open country. The pony I usually rode on such occasions being away, I took a wild mustang, so wild that he would not allow me to mount with my gun in my hand, but it had to be handed to me after I was in the saddle. I intended to ride to our hunting ground, where I expected to hitch my horse and take my sport on foot as best I could. We had just got to our hunting ground and I was riding on the top of a small ridge while Tom was below me some eight or ten rods, when I heard him exclaim, "Look here; there comes a hare!" Almost at that instant I saw the game cross in front of me, and without stopping to consult my pony in the matter, I flopped my gun from my shoulder directly over his head and banged away. The mustang was strictly on time with his part of the performance, for, at the crack of the gun, he settled back on his haunches whirling to the right on his heels like a flash, when overboard went your humble servant, and then away went the pony on a keen run through the chapparel toward home. I neither dropped my gun from my hands nor cigar which I was smoking from my mouth, but just as I gained my feet, Tom came riding up and says, "Where is your horse?" Oh, how he laughed when I pointed down through the bushes in the direction he had gone, and away he went at full speed in hopes to head him off before he gained the road. This he accomplished, driving him back, when I joined in the chase, and Tom finally succeeded in throwing a lariat over his head, choking him into submission; then I found that the machere of my saddle was gone, and we began following the back track over the ground we had raced until I found it. Then I secured the pony to a tough young sapling and we began our regular programme; and in a few hours had six of the big fellows hanging by their heels.

It is somewhat amusing to shoot one while running rapidly down hill, for his speed will often cause him to turn like a hoop for some distance. The breaking of one, either fore or hind leg, will not give your dog a chance to fasten upon this fleet-footed quadruped without a long chase. If they were better food the sport of this chase would be somewhat heightened, but as it gives play for quick shooting, and a fair test of one's capacity in the saddle, and is an exhilarating exercise, it may be classed as a fairly good sport. A.

WINTER GAME NOTES FROM THE PARK.

MAMMOTH HOT SPRINGS, Yellowstone National Park, Jan. 28.—*Editor Forest and Stream:* Last night Mr. F. Jay Haynes, photographer, with three assistants, came in from the Park via Yancey's. Mr. Haynes started out from here with Lieut. Schwatka's "exploring expedition" as photographer for the party. The exploring party soon came to an end by the collapse of their chief at the Norris Hotel, but Mr. Haynes engaged help, and with three men, Dave Stratton, Charles Stoddard and Ed. Wilson (old hands in the mountains), went on to Geyser Basin, back to Norris, then to the Falls and Grand Cañon of the Yellowstone, then over Mt. Washburn to the Springs. The party were three days making the trip from the Grand Cañon to Yancy's, twenty-two miles. They were lost several times during a blinding snowstorm, one day returning to a point within a mile of where they started in the morning. As they had no bedding nor provisions, expecting to make the twenty-two miles in one day, they suffered some hardships. Mr. Haynes secured some seventy-five negatives of winter scenes in the Park; he deserves great credit for his pluck and enterprise in securing these pictures. The explorers who started out with him found the Park much more difficult to explore than Alaska, or floating down a river on a raft. It requires the expenditure of considerable muscle to snowshoe it through the mountains, besides enduring some hardships and exposure.

Very little game has been noticed lately, for most of the travel through the country where it is has been stopped. Elk are seen by those on the road to and from Cooke City. A few buffalo are reported to have been seen near Soda Butte. Antelope still stay on Mt. Evarts. Soldiers acting as herders drive them back when they attempt to go down on the flats, fearing they will stray into Montana and be killed; but as they are liable to starve where they are, there is more danger of death to them than in Montana, where there is some feed and protection as well, for the game law is now in force.

The snow is constantly increasing in depth, a little falling every day. At this date there is more snow throughout the country than there has been in an entire winter for years. Even the elk find difficulty in getting about, the high winds crusting the snow very much. Snow slides frequently occur in Gibbon Cañon, on Mt. Washburn, and in many other places in the Park, where they have never been known to have run before. The place where a snow slide occurs can be readily distinguished, even in summer, by the timber, rocks and rubbish it brings down with it, littering the ground where it stops.

The rod and gun clubs of Montana are doing every thing in their power to induce the Territorial Legislature now in session to pass a bill making the close season commence December 1, instead of January 1, as now. They are also trying to make the law as protective as possible. This law, if passed, will be of great benefit to the game in the National Park, for the antelope, etc., as they drift into Montana during the winter, where they have often been killed for hides and heads. The Bozeman and Helena clubs are the ones doing most of the work to secure the new law, and deserve great credit for their efforts. The soldiers stationed here have very little to do, the deep snows prevent their moving around except to the town of Gardiner, where some of them manage to fill up with "tangle foot," preventing their return to quarters on time. This offense is punished by a few days in the guard-house. No whisky is sold to them in the Park—nothing but beer; this can be had at one of the hotels in this place.

All freighting between Cooke City and Cinnabar has stopped. The mails are carried from Soda Butte to Cooke by men on snowshoes. Cooke City, as a mining camp, is almost dead; even a railroad would not be of any help to it now. The Park branch of the N. P. which it was proposed to continue through the Park under the name of the Cinnabar & Cooke City R. R., is virtually closed; the last trip made over it required three engines and forty men three days to get to Cinnabar from Livingstone, a distance of some fifty-two miles. The last train took Lieut. Schwatka down to Livingtone after his Park trip. X.

The Massachusetts Snow Bunting Case.—Boston, Feb. 5.—*Editor Forest and Stream:* In justice to the Essex Gun Club, the Massachusetts Fish and Game Protective Association wish to make a statement regarding the "snow bunting" case mentioned in Forest and Stream of Dec. 23 ult. Upon inquiry by us the Essex Gun Club promptly expressed their regret that, unintentionally, they should have broken the law, and made amends for the same. We understand that the members of the club have done good work in the past for the preservation of game, and are heartily sorry for the unfortunate occurrence. For the association, Henry J. Thayer, Secretary.

WITH THE BEARS IN COON BAYOU.

MAJ. M. HAMBERLIN, who lives on Little Deer Creek in Sharkey county, Miss., is noted for his success as a bear hunter. He lives in a region where this game is often plentiful, is the owner of a pack of fine dogs, well trained, is fond of the grand old forests and on leisure days often indulges in his favorite sport, generally in company with one or more congenial companions. He is considered no mean hand with the rifle, being abundantly able at the critical moment to put a ball where it will do the most good.

B. V. Lilly, equally fond of the sport and equally successful, is regarded as the most rapid and unerring shot at running or flying game with a rifle in the country, and as to indulging in the sport, he has literally lived in the woods for nearly two years. He says he has "gone wild," and one who knew his history for the past two years would almost think so. I saw him last April for the first time. A party of three of us were off on a turkey hunt and had struck camp in the dense swamp on the east bank of Steele's Bayou, fifty miles by water above Vicksburg, Miss. Night had come on; we were enjoying our first camp-fire when the musical notes of a horn were heard a mile or so away. Off in another direction the baying of a dog could also be heard. The horn was evidently a call for the dog. An hour later the breaking of vines and the rattle of brush not far off announced the approach of something—at that moment we knew not what. Our curiosity and interest were not a little aroused when the man of the horn and dog came up. He introduced himself as Lilly, and from that night until this time Mr. L. leads my list of men who love the free life in the forests where game and fish are plentiful. On that particular day he had undertaken to move camp from the vicinity of our location, at the head of Big Island, to Coon Bayou, a distance of but a few miles, but unfortunately for this ardent sportsman the camp plunder was precipitously abandoned early in the day for the pursuit of a bear which had been jumped by the dogs. L.'s intelligent Indian pony not being at hand the chase was given on foot through the roughest kind of swamp, which was continued for hours by jumping logs, tearing through vines, wading shallow sloughs and swimming deeper ones, racing through prickly palmetto slashes, taking short cuts where feasible, but following with spirit and hope on the straight reaches. Some fifteen or twenty miles had been gone over and the pursuer had sought our camp at that hour in the night, leaving bruin at liberty with a sound hide in which to store away during the following summer the juicy pigs and succulent roasting ears of the Deer Creek planters. The vines, briers and brush had put in some effective work on L.'s clothes, though physically he appeared sound, buoyant and apparently without fatigue. In a rapid conversation, a brief summary of his experience in the vicinity of our camp, where he had been for two weeks, was given. Among other game he had killed fourteen turkeys. Likely places for us to hunt them were suggested. Early the next morning our new acquaintance took his leave with a cheery "good bye," wishing us good luck, and was off for another effort to move camp. Since then I have learned more of this "gone wild" man. He is a resident of Louisiana, where he is in comfortable circumstances, being the owner of three plantations. Being a widower his children were placed in school and his plantations leased before he took his leave for his long stay in the woods. Since last April his home has been in the woods in the heart of a game country with his dogs, his pony and a faithful negro servant as his chief companions. He leaves his camp for an occasional visit only to the plantations. He is not essentially a "backwoodsman," as one might expect, but intelligent, using good language fairly free of slang, entirely free of oaths; he touches no tobacco, uses no strong drink, not even coffee, and Sunday is said to be a hallowed day with him; the wildest animal is free to nudge him in camp on that day if it wants to, but is warned to leave no tracks for Monday. His pony wears a bell, muffled when the horse is used, when left, the clapper is released as an aid in finding the animal during the day, and if not returned to the intelligent creature returns unerringly to camp at night, where his master is generally found, though not always, for he has been known to sit all night under one tree for a very old gobbler, and another night at the root of another tree in the hollow trunk of which a bear had taken refuge, each game being killed early the following morning. Such is Lilly, the most ardent hunter in the Mississippi swamp.

Maj. H.'s residence being but two and a half or three miles from Coon Bayou, the two sportsmen were not long in joining hands in the chase, their two packs of dogs becoming one for making havoc along the "stepping paths" of the black bear. These two gentlemen are reputed to have killed more than thirty bears last summer, twenty-seven of them having been killed during the months of June and July.

The requisites for a pack of good bear dogs are that some of them have good noses, trained to follow no other trail than that of a bear, and that others have fighting qualities with ample courage to tackle a bear, combined with caution and alertness sufficient to keep beyond the reach of his powerful fore paws. The bear, having been trailed to his lair by the hounds, is jumped and pursued by the pack. As he runs the fighting dogs nip him in the rear, and, if there are a sufficient number of them, he is compelled to stop and defend himself. As soon as the dogs are forced to a distance his bearship makes another break, but is soon overtaken and forced again to fight. It is fight and run, run and fight, until the bear becomes satisfied that running will not save him, when he gets in a dense thicket or cane brake, if he can put his back in as much rubbish as possible to protect his rear from the onslaught of the dogs and gives himself up to the business of defending himself. Woe to the dog then that gets within reach, for an ugly wound or death would be meted out to him. Valuable dogs are often killed in a fight of this kind. While the fight is progressing the hunters make all haste to the scene of conflict, and the first to arrive generally wins the honor of bagging the beast. It is often a critical proceeding at close quarters, where a fine dog may be shot, if indeed the bear is not made furious by awkward work and the life of the hunter himself put in jeopardy. Experience and coolness are needed about that time. A black bear, however, is not considered dangerous by those most experienced in hunting him, except in certain cases. Females, to protect their cubs, or, occasionally wounded ones, will show fight.

When one does turn upon the hunter some effective work on the defensive is to be done, and done quickly, or the bear will prove victor, wounding his pursuer if indeed not killing him, though the latter result is very rare.

A short time ago Mr. Lilly was compelled to show his back to bruin and pick up his heels in no absurd haste. The animal was a tremendous one and in a previous fight had killed one of his most valuable dogs. This probably led the hunter to be a shade rash in venturing too close. Eleven .44 Winchester balls had been fired in rapid succession, when the bear turned furiously upon his antagonist. At this juncture the magazine of the rifle became empty, and the knife was resorted to. This was a large and heavy implement, weighing 2 or 3lbs. A lick with this cut an ugly gash diagonally across the nose of the bear, which howled with pain. L.'s activity and swiftness in pursuit of a bear is something of a marvel to those who have seen him in the chase on foot, but his powers as a runner had not been taxed to their utmost until he was put to retreat. At this time he admits having executed some movements entirely superior to all former efforts. The rifle, the faithful rifle, that had never failed him before, was empty; the knife had only served to aggravate the beast and make him more furious; and anyway its use required a contest at entirely too close quarters. In L.'s mind there was no question as to what should be done. It was flight, and nothing but flight.

The pursuit for a short distance was so hot that L. sprang behind the first large tree he could reach, but by this time the wounds of the bear had so weakened him that when the tree had been reached, he reeled and started off in another direction. L. promptly reloaded from his pocket this time and gave the animal a ball that killed him. L. was alone on this hunt, and it is conceded by himself as well as Major Hamberlin, to whom he gave a graphic account of the affair, that had the contest taken place in the cane, or a dense thicket, as is usual, instead of in a tolerably open place, the bear would have killed him without giving him sufficient time for even a brief prayer.

It was with no little pleasure that some three weeks ago, during the holidays, on going to Major H.'s on business, I found that a big bear hunt had been planned, and I was invited to join the party. Coon Bayou was said to be fairly alive with bears, and we were dead certain to get one up early in the day. An early start was to be had, and all necessary preparations were made in advance. As the locality was one of dense undergrowth, tangled and tied together with many varieties of vines, the pursuit of game was very difficult, and the chances of securing it depended largely on the number of hunters, so quite a number had been invited, and it was expected that bruin would be worried somewhat on the morrow. As this was to be my first hunt for bear, I was much interested in everything pertaining to it. It was suggested by the Major that I was as likely to kill a bear as any one of the party, owing to the denseness of the thickets preventing the experienced hunters from riding fast. I was not altogether certain that I wanted to kill a bear, though I was fully resolved to go into the woods and see whether the spirit moved me to do so. About then I thought of my legal friend Miller, of Princeton, Ind., who some years ago was a guest of a couple of natives in Arkansas, who took him out on a bear hunt. The bear being put up was vigorously chased by the dogs, and finally brought to bay in a dense cane brake. The hunters galloped through the open swamp to the edge of the cane and dismounted. There was considerable racket going on not very far in the brake. One of the natives proposed to hold the horses, but Miller promply and emphatically said he would hold the horses, and he did hold them, much to amusement of the Arkansas gentlemen, who had organized the hunt for Miller's especial benefit.

C. O. Willis, of Vicksburg, was expected up on the night train. Foote, Sheriff of Sharkey county and one of the finest shots in the State, was to be down from Rolling Fork on the early morning train. Mr. Smith, a good bear hunter, of Mayersville, would be with Foote, and Lilly would be there. Well, Willis failed to put in an appearance. About 2 o'clock in the night, every one at Major H.'s was awakened by the blowing of horns and the yelping of dogs. This commotion was created by the colored servants of Foote and Smith, who had brought their "bosses'" dogs and horses. Breakfast was had early, and not long thereafter Major H., myself and the two servants were in line riding over to the railroad station of Onward, about a mile away. Here I made my first fizzle as a bear hunter. A horn had been given me, and my efforts to blow it were practically failures, creating some merriment at my expense. At the station I got rid of the horn by giving it to Smith, who weighs 275lbs., and can blow a horn that can be heard all over Sharkey county. Swift, the storekeeper at the station, also joined us. He was a tenderfoot along with me. Lilly had not yet shown himself, but it was predicted that when the dogs opened he would be soon heard from, and this proved to be the case. We filed off from the station, an interesting spectacle. First Major H., next Smith, then Foote, Swift, the Scribe, first darky, second darky, and scattered about on the sides, front and rear, the fourteen dogs. Horns were blown, dogs yelped, the hunters talked and laughed, and even the steeds seemed to partake of the animation of the party.

We rode out of the field, down into the clearing and beyond into the woods. A wagon road served us a while, then a path and finally we took to the brush and vines, leading a devious route in a general easterly direction. It took no little dodging and winding about to get to Coon Bayou. A few shins were scraped, hats knocked off and faces and hands scratched, but when we reached the bayou the party was in fair shape. Here a brief council was held. The Major was to remain on the southwest of the bayou with the dogs, Foote, Smith and one servant would cross, while Swift and I concluded to dismount and take our chances along the bank of the bayou on foot, leaving our horses with colored boy No. 2.

In crossing the bayou we found it a little boggy. Foote and even Smith got over comfortably on their horses, but the black boy who was riding a mule bogged. This necessitated a dismount and a slight wetting, which, however, was not considered to amount to anything on a bear hunt.

It was not long—perhaps twenty minutes—after Major H. had disappeared among the vines, when the energetic yelps of the hounds told that a warm trail had been cented. A pack came to the bayou about 300yds. above and crossed. They went off in a northeast direction and soon gave tongue with so much animation that even an amateur was satisfied that bruin had been aroused. Another pack led off southeast, but with much less spirit. After listening to the dogs awhile it was a plain case to Swift and me that there was no blood for us before either of the packs; so I walked down a hundred yards or so to where he stood to condole with him. Just previous to this Lilly had hastily ridden up, taking in the situation and spurring his pony in hot haste across the bayou, taken out after the northeastern bear. The vines were seen to open up across the bayou and let him in, then to close up and shut him out from view, and that was the last seen of him for several hours. Swift and I were not in for blood, as I have said, but it was because the bear had dodged us. We were there to do our part and could have done it had he only shown up.

Not long after Major H. rode up, dismounted and sat down by us. He corroborated our theory that two bears were up, a northeaster and a southeaster. The southeaster had "lit out" for foreign parts; the northeaster he thought might be brought to bag. Was not Foote over there? Was not Smith the vinebreaker over there? had not Lilly, with blood in his eye, gone there, and was not Foote's servant over there with his gun loaded to the muzzle? And shots had been heard in that quarter, though they might have been made by others. But hark! what is that? Listen! We listened. We continued to listen. We listened for ten minutes. A baying could be distinctly heard in the distance, continuing apparently in the same place. The Scribe draws a compass and locates the sound a little east of north. "That dog (calling his name) has a bear," says Major H. Swift proposes to the writer to go to it. "How far is it?" "About 1½ miles," says Major H. Being that distance the writer sanctions the journey. Swift and he proceed down the bayou 150yds. to a log where they cross, leaving Major H. sitting on the bank. Here they made what they conceive to have been a narrow escape. Ten minutes after they crossed over a large bear is seen by the Major to cross on the same log in an opposite direction. Just to think of the bear having been ten minutes earlier or us ten minutes later! The bayou is not very wide, but there is plenty of open space about there for quite a little scene. As in the case of McPherson and Blenerhasset, who was entitled to the right of way? By Blixen! somebody would have had to take to the water, and it was a cold day too, or there might have been more than a scene, possibly a catastrophe. The Scribe is really glad he is here to write this letter to dear old FOREST AND STREAM.

Well, the twain proceed toward the 1½ mile distant bear. Swift (who is not swift) gets tired and wants to rest. The writer consents. They rest. They go on, and soon, very soon, Swift gets tired again. They rest again. They proceed and rest again. Swift is great on resting, and his companion is clever and waits for him—under protest. They journey on, and the notes of the dog are much more distinct and still in the same place, a little east of north. Swift thinks that is fine music and wants to listen to it a while; and they listen. S. suggests that probably it is a turkey treed. The journey is resumed with vigor. A dog that is with them leaves and joins the other dog. The barking is something furious and "tolerable" close. Too much rumpus for a turkey. Swift is very tired, and proposes that the writer go on to encourage the dogs and wait for him, and give him the first shot. Writer is willing to give S. first shot, but would like to have S. hurry up and take it, but S. sinks down on a log to rest. The writer progresses, but the vines prevent rapid progress. It can't be more than 60 or 75yds. away now. Jupiter! those dogs are cutting up furiously. Wonder which one of those two thickets they are in? Guess it's the nearest one. Let's study a minute to see how the bear ought to be shot. Yes. Just behind the fore shoulder, a little below the middle. That'll fix him. Hope he can be got at on the side. Hard to kill a bear from the front. "Swift; oh, Swift!" No answer. Bang. Ten seconds, during which only the dogs are heard. Bang and crash. Swift yells to the writer whether he heard him fall. The intervening space of 60yds. is rushed over by the 1½ mile trampers and a third party opens up to view. It is Foote with an expression of satisfaction on his face. He has killed the bear. Swift and the writer are much put out. Had they had any idea that Foote was in that part of the woods the bear would have been killed a quarter of an hour ago. The writer especially regrets now that he dilly-dalleyed resting and waiting with S. S. be hanged!

Three long, resonant notes are blown by F. After a bit they are repeated. It is the call to the other hunters that the game is killed. F. blows a horn splendidly. Guess he feels good any way. He blows again and again. In fifteen or twenty minutes Smith and the negro ride up. Foote and Smith proceed to abuse each other about another bear, the first one put up by the dogs—a very large one. Foote was expecting every moment a more favorable opportunity, had even raised his gun to shoot when Smith, coming up on the side, had turned the animal. Smith was also maneuvering for a shot, had a good chance, but thought to get a better when Foote turned the animal. This led Smith to some hasty movements for a shot, when his spur, catching on some vines, threw him backward on a log in such a way that he could not quickly get up. About the same time the negro had taken a shot through the vines at a distance from the bear of about twenty-five feet. The bear turned again, came close to Smith, still tied up, took a good scare at him and lumbered off in great haste, leaving the trio in possession of an empty swamp. It was certainly a ridiculous figure Smith had just cut with his 275lbs. of corpulency tied up in the vines, flat on his back, while a huge bear cavorted around with six or seven dogs in full play. Such a moment as that for triumphant work comes to most sportsmen never at all. It was a moment of supreme excitement even to this experienced hunter, who enjoys the enviable reputation of having killed his bear in many a close contest. But he was decidedly beaten this time and there was no help for it. As a retribution he desired that Foote give him a good kicking, saying the punishment would really feel good to him.

As the two men talked of the failure to stop this bear, it occurred to a man up a tree that some awkward work had been done. It seems that Lilly's system should have been adopted on this bear, viz., to fill him up with lead. No matter which part is presented it is rapidly stuffed with a repeater. No better opportunity is waited for, and all opportunities made the best of. Swift and the Scribe ought to have been there; they would have fixed him in hot haste and put these cool-headed hunters to shame.

This ended the hunt. The party in at the death of the little bear (for it was a small one) determined to get out of the woods. An attempt was made to load the bear on the servant's mule, but an emphatic objection was made by his muleship in the shape of a vigorous and promiscuous kick at the entire party, missing all but the luckless negro who was holding the bridle in imagined security at his head. Just how the negro was hit is not known. It was a feat of no little dexterity for even a mule, and is supposed to have been the result of an old grudge. At all events the mule did not want to carry that bear and he didn't carry it. The negro had thrown down the reins when the mule took to his heels remarkably fast for that vine-tangled region, with his head toward his home at Rolling Fork, twelve or fifteen miles distant, and he was not seen nor heard from during that nor the next day. The bear was securely tied behind the saddle of Mr. Smith's horse, which seemed familiar with the proceeding. The negro, of course, had to walk back to Major H.'s, who, along with Smith and Foote, took the most direct route, while Swift and the writer took, as they thought, the nearest way to Coon Bayou, where they had crossed, but they missed the direction a few degrees, passed to the east of a big bend in the bayou and went fully two miles out of the way. S. continued to complain of fatigue, but got along much faster than he had done in going over to the bear. The bayou was reached a long way below the horses, but the journey back was enlivened by the notes of a horn up the bayou which continued at intervals to send forth its blasts. It proved to be blown by Lilly, who had gone to our riding animals and waited for us to show us the way out of the woods.

The party were all in at Major H.'s by dusk. In comparing notes it was ascertained that four bears had been put up during the day, three of them having been seen. Lilly had given chase to the one Foote, Smith and the negro had scrambled after, but being behind had failed to overtake it. A shot, yelling, and the silencing of the dogs told him that the bear had been killed not far ahead, but thinking that some of our party had done the work, he turned to give chase to another bear that was up. It was not until the party had collected that it was ascertained that an outsider hearing the dogs had gone to them and killed the game before Lilly had come up; and it was too late then to get in a claim for the meat. In cases of this kind it is customary for the party doing the killing to promptly notify the party owning the dogs by blowing the horn or otherwise, when the game is usually divided among all parties concerned.

The error that had been made during the day, as brought out by the conversation at night, was mainly in permitting the dogs to be divided, there not being a sufficient number of dogs with either of the large bears to stop him. One dog only had been hurt during the chase; a bear had cut a gash two or three inches long on one hip.

The meat was divided, and the skin falling to Foote, who had done the killing, was given to Swift for his valor in his magnificent effort to be on hand to do the killing himself. It was a fitting reward richly earned.

It was not the least interesting of this chase to sit over a warm country fire of blazing logs and listen to a rehearsal of the day's events, which dogs were after this bear and which after that, which had shown courage, and which had gone off on a trivial trail of coon or possum; how a certain bear might have been secured; how the party should be placed at the next hunt, etc. The ludicrous situation of Smith was not a little laughed over, especially by Foote, who appeared to be getting even with Smith in settlement of some old score, such as having on a former hunt shot a bear in the foot, or something of the kind.

I shall long remember this hunt as a pleasant affair, though I shall continue to regret that I stopped so often to rest Mr. Swift. I might as well have drawn blood on that little bear as not, and Foote being an old hunter would not have missed it from his score. If the Major and Mr. Lilly propose to continue to slay bear in that region, I shall try and happen in on them on business again some time, just when they have organized for a big hunt. They are both men who are companionable to the fullest extent, in the woods as well as out of them. To any man fond of hunting it is worth a long journey to spend a day with them after game. W. L. P.

VICKSBURG, Miss.

AN OLD TRICK.—A correspondent sends this note of how a tenderfoot was tricked "sniping" game, which has been repeated several thousand times since the world began. Bunco steerers find ready victims in city streets and the "bag game" of the woods will never cease from lack of verdant material to work it on: "Five of us were camping in the Adirondacks. L. was green. F. asked him if he would like to go out with him and trap a few partridges. They set out with a pack basket, blanket and some corn meal. F. placed the basket with its mouth along the ground and sprinkled the ground near by with the meal, and told L. to get behind the basket. F. then placed the basket over both, so as to completely cover everything, but the mouth of the basket, and giving L. instructions to keep quiet, and in case a partridge should walk in, to throw the blanket over the mouth, left him to the gnats, and started to beat the bush, being careful to beat in the direction of camp. There he told the others about it, and we all had a good laugh. L., poor fellow, waited under the blanket for nearly half an hour, when F. returned, saying he could not scare up any game, and asked the 'basket man' if he had heard any. L. was pretty sure that he had, for he heard a sort of quick step and a cluck, but none had come near enough to catch."

HAMMOND, Ill., Jan. 20, 1887.

U. S. Cartridge Co., Lowell, Mass.:

DEAR SIRS—To-day I made a test of shells and settled in my mind a long disputed fact in regard to the amount of times the U. S. shells could be reloaded. I took five shells from a box of 100, and shot them as fast as I could get them reloaded. The following is the result: First shell, 9 times; second, 11 times; third, 10 times; fourth, 13 times; fifth, 9 times. I could have loaded and fired some of them again, but the above result settled the question of their reloading qualities in my mind. I am sure all hunters and shooters ought to know of the good qualities of this shell, and I give you liberty to publish this, and will further say I am not in any way interested in any shell company, and give this letter for the benefit of all sportsmen. I am sure we are all seeking for the best, and if I can assist any one to find the best I will gladly do so, and this is my reason for sending your company this letter. Wishing you every success, I am, yours truly,

*** (Signed), L. S. CARTER.

"Hunting Without a Gun."—Raleigh, N. C., Jan. 30. —*Editor Forest and Stream:* Your correspondents' notes about hibernating squirrels recalls an experience I had last January in Chatham county, this State. Two of us on horseback, squirrel hunting, were accompanied by an odd character named Cooper, who went along on foot and was provided with a small club ax, hanging through the leathern girdle or belt, which served the purpose of suspenders as well as to carry ax and knife. We were in the thick woods, the wind blowing a gale and it was snowing. The dogs were heard to open, and off went Cooper with a rush ahead of the dogs, peering up into the largest trees. In a moment more he had divested himself of shoes, coat and hat, was climbing an oak 2ft. through as rapidly as a boy. He was soon out on one of the largest limbs astraddle, peering down into a hole which led back into the body of the tree. His ax was out and he was cutting an opening a foot below in the tree. The old hat was stuffed into the upper hole and in went his arm into the lower one. With guns cocked we were anxiously awaiting to see the squirrel bound up on some of the limbs to see who should get the first shot. Imagine our surprise and my disgust when I saw Cooper's arm drawn from the hole, squirrel in hand and the creature's neck broken by a quick bite, and the booty thrown to the ground, dead as a stone. In went the arm and out again, another squirrel in hand. The same process of killing was gone through until he had thrown down five from this one hollow. Not a squirrel did we see until Cooper had killed them all. We followed them until late in the evening. The same maneuver was gone through, and in each case he killed all the game, and we would not have had a shot but that we, finally growing disgusted at this kind of a "squirrel hunt," protested. Out of nineteen squirrels we gunners killed five, and Cooper the remainder. At one large post oak he found in the hollow nine, killing them all as I have described, much to our disgust. —M. T. L.

Wolves in Wisconsin.—Milwaukee, Wis., Feb. 4.—Since our legislators repealed the law (some four years ago) which provided State bounties for the destruction of wolves, those voracious animals have increased at an alarming rate, in the central and northern portions of Wisconsin. In the county of Marathon they are especially numerous, and it is an every-day occurrence for farmers and woodsmen to be hunted and treed by the hungry brutes. Large numbers of sheep and hogs are being destroyed—often in the presence of their owners—who are powerless to act agains the formidable numbers of the enemy. A friend of the writer, who is engaged in lumbering in Marathon county, was lately pursued by a pack of the "varmints." He said they numbered about twenty, and were within ten rods of him, when he, luckily, succeeded in climbing a half-grown pine tree, but he was so terrified and exhausted from the proximity of the wolves and the distance he had run to reach this particular tree, the only one in the vicinity that could be climbed, that he came very near falling down into the mouths of his terrible pursuers. It was a close call. The people of that section are urging upon the Legislature the necessity of enacting rigorous laws for deliverance from these dangerous pests.—Muskeego.

Massachusetts Woodcock.—Taunton, Mass., Jan. 24. —I have been a resident of this section for more than thirty years, have had personal experience in woodcock shooting, and am familiar with all the woodcock covers within twenty miles. I have interviewed most of the gunners in this section and find no very large scores of woodcock for the last season. The numbers bagged by two noted market-gunners were 8 and 13 respectively. I have known one of these gunners to kill more than 200 woodcock in a single season on the same grounds. I fear the scores that "Cohannet" gives in issue of Jan. 13, were made a little early in the season, as he claims to have shot five in a half day's hunt this year during September; from the 10th of July until about the 20th of September is what is generally known to sportsmen as the molting season of the woodcock, they are seldom found during that time. The snow that came early in December saved a great many quail, the deep snow made difficult tramping for the gunners, and few were killed in December.—Woodman.

MAUD.

A THRENODY.

"Only vast silence, like a strong, black sea,
Rolls in 'twixt us and thee."

How sullen fall the flakes of snow!
How sullen seems the earth around,
As, gazing the thick smother thro'
I see a lone sepulchral mound,

'Tis there she lies, my beautiful!
Safe sheltered from all storms and strife,
Who, year by year, so dutiful,
Found favor in my heart and life.

One year ago how braw she seemed,
In yonder stall, and gave low neigh
To welcome me. I little dreamed
How dark would end that winter day!

Thus all things pass. The flower, the fruit,
The nearest kin, the dearest friend
An instant known when, at the root,
Death gnaws and silence is the end!

Yes! silence followed hard upon
Thy taking off. Aghast I stood
To see thy seal of mystery won
So suddenly, O, Maud, so good!

Fair as the May, my mare, wert thou!
A grateful memory thy bequest,
Of all thy virtues I hold now,
Among my memories the best.

Thy travels past I journey on
To goal like thine—the end of all!
Thou hast my love, memento won,
I have thy bit, thy empty stall!

O. W. R.

The Mutual Life Insurance statement in another column shows forcibly the sound condition of that great institution, the assets footing up the total of $114,181,963.-24. The company has nearly 130,000 policies and annuities in force, amounting to $393,809,202.88.

THE SUNDAY FISHERMAN.

This man above, on fishing bent,
One Sabbath morning left his tent.
The tent, Λ

He took his can, and very quick
He dug his fish-worms with a pick.
The Pick, ⊢ The Worms, ᔕ ᔕ

In case some fish of size he'd get
He took along his landing net.
The Landing Net, ℸ

As fishermen get hungry, too,
Of pretzels he procured a few.
The Pretzels, ᘐ ᘐ ᘐ ᘐ

Some lines he took along on spools
To teach them to the finny schools,
The Spools, ⊢ ⊢ ⊢

He had some entertaining books
Of highly tempered Limerick hooks.
The Hooks, J J J

And thus prepared, he got his boat,
And out upon the stream did float.
The Boat, 〓

Some bites he straight began to get,
It was the gallinippers bit.
The Gallinippers, ⋉ ⋉ ⋉ ⋉

One of his lines spun off the reel;
He landed in the boat an eel.
The Eel, ᔕ

Then quickly it began to rain,
But his umbrella was in vain.
The Umbrella, ⊤

Above his head the thunder crashed,
And all around the lightning flashed.
The Lightning, ≷

The storm blew, and the boat upset,
That man went down into the wet.
The Upturned Boat, 〓

And as he sank, the bubbles rose,
Smaller and smaller toward the close.
The Bubbles, o o o o o

MY SECOND SALMON.

I am almost ashamed of myself when I think of it; to think that I, a grown man, should have been guilty of such undignified and altogether absurd antics; but, after all, I was very young, not in years, alas, but in experience. It was my first season on a salmon river and only my second fish. I had gone to a pool not frequently fished, some three or four miles from the delightful camp which my companion and I had established sixty miles from tide water on the finest salmon river on this continent, all things considered. Two hours of rather awkward casting had yielded not a rise to my fly, although the salmon were at home, as was made apparent by frequent rises and leaps in portions of the pool other than those covered by my efforts.

At last there came a great surge, just a flash of his silver sides, and I had him; he was a beauty, too. I knew it "by the pricking of my thumbs," and he was fast, that I knew by that indescribable something that tells us at once that we have him safely hooked, or that puts us in such a nervous flutter that we feel half beaten from the word go. I had this fellow, and I knew it, greeny though I was. It was, as I have said, only my second salmon, but in looking back at it over the many years that have passed, I do not see how I could have played that fish more judiciously if I had been a hundred years old, and after a lively fight of half an hour he turned his white sides up to the sunlight and became obedient to the slightest pressure from the rod, but there was life in him yet, as appeared later.

Slowly and most carefully I drew him near shore. The water was shoal for a considerable distance from the beach on which I stood—a bad landing place, but the best there was.

My gaffer, Tom, waded into the water twenty or more feet to a point where it was some two feet deep. Slowly the great fish, still struggling feebly, was drawn and coaxed toward the gaff, at last he was within reach and with a quick, yet deliberate, stroke (no better gaffer than Tom lives) he was fastened. My strained muscles relaxed and my lungs expanded with that long breath of intense satisfaction and unalloyed happiness which is never fully felt by any one except the angler who sees his long fight crowned by such success as seemed to be fully within my grasp.

Suddenly something inexplicable, something terrible, happened—what, I did not quite know, but the fish was gone, and Tom was making frantic plunges in every direction at once. Before I could well comprehend the situation the fish again appeared at the end of the gaff and Tom, with agony depicted in every line of his features, was making long strides, with a great splashing of water, toward the shore. Again that fearful something happened and the fish disappeared, and again Tom was striking here and there, apparently at random, this time accompanying each stroke with profane ejaculations, sometimes in the best English at his command, but resorting to the Micmac whenever the occasion demanded especial energy of expression.

Once more the fish became a captive, and this time was borne some four or five feet up the shelving beach, when he slipped off for the third time and Tom, abandoning the gaff, threw himself bodily upon the fish, now flopping about as lively, apparently, as ever. The other Tom (there were two Toms in my canoe that season) ran in and threw himself upon the struggling heap, and I, not knowing exactly what to do but feeling that I ought to take a hand in somehow, laid down my rod and threw myself on top of the whole.

Reaching down I got what I supposed was a fair hold and commanded the two Toms to get up, when, with a mighty effort, this thrice gaffed fish tore himself out of my feeble grasp and regained the water.

The leader was of course broken by this time, and, partly on his side and partly on his back, he managed to keep himself just beyond the reach of the three pairs of outstretched hands until he gained a point where the water was three or four feet deep, when, with one supreme effort, he got himself right side up and disappeared in the deeper water, leaving a great trail of blood behind him. "Phancy our phelinks" as we stood there waist deep in the cold water staring at each other.

The cause of this misfortune was not far to seek, it was, as I have said, my first season, and my tackle was new and untested (it is seasoned and tempered by the fire of many battles now), and the gaff proved, upon examination, to have been made of soft, worthless metal, which had given way under the strain and opened out so far as to allow the fish to slip off. To say that I was greatly disappointed would be putting it mildly. I was just sick. There was no use in getting mad, but if the man who sold me that gaff had been within reach at that moment —well, never mind, something would have happened to him. Sadly I laid my rod and the treacherous gaff in the canoe and mournfully we commenced our return to camp; dead silence reigned, the birds sang not for us and even "the springing trout lay still;" there was no sunshine in the sky and the ashes of desolation settled thickly on our dejected heads; we felt that life was a mockery and that our doll was stuffed with sawdust.

So we sadly crept toward home. Suddenly Tom of the bow addressed to Tom of the stern a few words in his native Micmac, which he of the stern translated to me thus: "We go down little way, p'raps we fin' him dead somewhere, mus' be dead, gaff him three times, mus' kill him less he ghost—think so."

To be sure, why not? I ought to have thought of that myself, but I was very young then. So we drifted back to the point where we last saw the salmon, and letting the current take the canoe where it would, assuming that it would take us in much the same direction that it had taken the fish if he were indeed dead, we stood up to watch the bottom.

Now that we had a new hope born within us the sun shone again, the birds sang, and all was joyous. The pool was a long one, two hundred yards at least; but the salmon usually lay in the upper end at the foot of a heavy rapid, and it was at this point that our misfortune had occurred. Below this point the water became quite still and gradually deeper, until at the lower one-third of the pool it was twelve or fourteen feet deep, but very clear. We had passed over nearly the entire length of the pool and despair was fast overtaking us again, when I saw our friend feebly struggling near the bottom, but far beyond the reach of the gaff, which we had put into shape as well as we could with our hands. Only a few feet more and the fish would be in the jaws of the long rapid below and his recovery a matter of grave doubt. What could be done had to be done quickly.

Fortunately I had in my pocket a stout cord, a habit of carrying which I had acquired by association with the companion before mentioned, and with this the gaff-handle was bound to the end of one of the setting poles, and while Tom of the stern held the canoe in the proper position, Tom of the bow for the fourth time inserted the gaff into the fish, and gently, oh how gently, lifted him over the gunwale, and at last he was ours. Ah! then how I laughed, how I shouted, how I sang. I patted and I petted that fish. I am not sure that I did not kiss him; I talked to him like a dear friend and behaved like a crazy man generally. And this brings me back to the point where I commenced, I am almost ashamed of myself when I think of it; but I was very young—it was only my second salmon and he weighed twenty-seven pounds.

What would you have done if you had been in my place? S. A.

Rutland, Vt.

EARLY MAINE FISHING.

Though it is hardly past midwinter, yet there are those who are already thinking seriously of the early fishing trip to the Maine waters. They talk about it, and it is pretty sure that they dream about. Indeed I had the pleasure of inspecting the outfit of a new camp that is about being built, only yesterday. The builders are Boston gentlemen, very well known in the printing trade. Indeed if it was to be styled a printers' camp, it would not come far out of the way. The camp is to be built in the Narrows, Richardson Lake, Maine, or better understood between Lakes Welokennebacook and Molechunkamunk. It will probably be located on the high land nearly opposite Metalic Point, so long well known to the former visitors to that part of the Androscoggin Lakes. But the extra flowage, put on to that lake six or seven years ago, covered Metalic Point and made the Narrows one of the most celebrated fishing grounds for spring trolling of any in the lake regions. The primary projector of this new camp in the Narrows is Mr. C. P. Stevens, well-known to the whole printers' trade of New England, as one of the firm of Wild & Stevens, of printers' roller fame. Joined with him are his nephew, F. H. Stephens, bookkeeper at the firm's place of business, No. 12 Hawley place; Mr. E. J. Shattuck, in the printers' ink firm of Geo. H. Morrill & Co., 34 Hawley street; and James N. Smart, of the well-known printing firm of T. J. N. Smith & Co. These gentlemen have decided to build a camp 24x24, to be completed in season for the spring fishing. This will have to be rather early, for Mr. Stevens is noted for being one of the first at the lakes. It was this gentleman of whom the Forest and Stream had an account last year as having gone up to the Narrows before the ice went out, in order to be on the ground for the early fishing. That time he had the pleasure of rowing seven miles to the mouth of Mill Brook for minnows for bait, since there are no minnows to be found in their usual haunts thus early in the season. Besides, he had the pleasure of tenting out in a fresh snow fall of four inches. This spring Mr. Stevens has a large number of minnows in a spring somewhere on his route ready as soon as the ice goes out of the Narrows. By this early fishing Mr. Stevens has made his score to include the greatest weight for the number of any score included in the fisherman's yarns. The five, and even up to the seven-pounders, are very plenty in his record.

Mr. Stevens starts in a day or two locate his camp, although the lumber has been hauled up to the Narrows for some time, but the party desire to have the best location on high ground to be found in that vicinity, and Mr

Stevens will make a winter trip to select the site. The camp is to be built by Adana Brooks, the well-known guide, from Upton, Maine; the same Adana who run the Middle Dam camp for so many years, and made a host of friends in so doing. Adana, with Steve Morse, of the same town, has guided Mr. Stevens and his party for a number of trips. Mr. Morse is the guide who really took the great trout now in the Smithsonian Institute, the largest *Salmo fontinalis* on record. The camp will be called Vine Vale camp.

It seems that the parties from Andover, Maine, who desired to put in steamers for public travel, in opposition to Chas. A. J. Farrar, the veteran steamer man of that part of the lakes, did not succeed in obtaining a charter from the Legislature now in session. The last report says that the committee returned the petition for a charter of that kind, indorsed, "Inexpedient to legislate." This is as it should be, for Mr. Farrar has labored hard, and received but little of real profit. SPECIAL.

SURFACE SCHOOLS OF TROUT.

Editor Forest and Stream:

A few years since while casting for trout from a canoe on Moosehead Lake, Me., one fine afternoon in September, between Farm Island and Hardscrabble, I witnessed what to me seemed a very strange occurrence. I had taken some fine trout, when suddenly they stopped rising, and the lake being very smooth, suddenly within a few feet of the canoe and as far as I could see, trout of all sizes, ½lb. to 6lbs. each, appeared near the surface, with their dorsal and caudal fins above the surface, moving very slowly and remaining in sight perhaps four or five minutes; then they sank below the surface as quietly as they had come. During this time they took no notice of the fly whatever. They did not seem to be feeding nor in want of air. I have cast the fly many seasons and in many waters, but this was the only time I ever saw the like of this. Our old guide, Uncle John Coombs, also gave it up. Will some of your readers give us light?

JOHN H. WAY.

The same phenomenon was witnessed at the Mastigouche Lakes last season by our correspondent "Spicewood," who wrote of it in issue of Oct. 21, 1886, as follows:

"As we sat by our camp-fire the evening before, P. had told us of a strange sight he had seen as he came across the lake. A large school of fish swimming on the top of the water with their backs out of water so that he could see them packed like sardines in a box. In the dusk he was unable to see what kind of fish they were, but plainly saw they were of good size. We hoped in the morning to solve the mystery. We had been in our canoes only a short time when we saw here and there over the lake often a score of these schools in sight at once. We moved carefully toward them or put our boat in their course. As we came near them we found them to be trout; as soon as they saw us, with a swirl that made the water boil, they went out of sight. We repeatedly tried to have them take our flies, making long casts so as not to frighten them, but they always passed the bait unheeded. After they had disappeared we let out a long line, trolling deep and drawing it through the place where they went down, and often took fine, gamy fellows. Tom proposed that I "should scratch their backs." A school was passing us some 40ft. away, I cast my line, the leader fell right among them; a quick jerk and I hooked one in the back; the only smile I saw upon the Indian's face while I was in the woods with him was as he watched the antics of this trout with his back scratched. * * * Will some of your readers give a reason for the trout going in the schools as I have described; we only noticed it in this one lake and our guides had never seen anything like it before in any of the many lakes in these woods where they had fished for a score of years."

NATIONAL ROD AND REEL ASSOCIATION.—Secretary Gonzalo Poey, P. O. Box 3049, New York, has issued a circular which says: "The Fifth Annual Tournament of the National Rod and Reel Association will be held at Central Park on May 25 and 26. As much interest is shown in these contests, and generally the latest improvements in rods, reels, etc., are brought forth, we deem it to the advantage of the trade to support us in carrying out these tournaments by donations of prizes to be given to competitors. Heretofore the leading firms in the trade have cheerfully and generally contributed to this end, and we call for a continuance of such favors. At the same time we would say that each contribution will be so acknowledged as to prove of value as an advertisement to the donor. Should you feel disposed to contribute, please inform us to that effect before the first of March next, or send your contributions to the Secretary. The committee would suggest that the classification of prizes be left to them as far as possible, *i. e.*, that the prizes be not restricted to certain classes, and would add that it is not their intention to give fishing tackle as prizes in the Expert Fly Casting Classes." The Committee on Prizes are Messrs. Jas. L. Vallotton, C. G. Levison, H. P. McGown and T. B. Stewart.

THE AMERICAN FISHERY UNION.—Representatives of the various fishing industries met with the U. S. Menhaden, Oil and Guano Association at New York on Jan. 12 and formed a working organization under the above title. A circular has been issued inviting all interested to attend a meeting at Gloucester, Mass., on Feb. 23. "It is desired that a full representation be present, a permanent working association be organized and immediately enter upon such work as may be thought best for the advancement of all the various branches of the fisheries, including salt and fresh-water food fish in all its branches, cured and fresh; oils, fish and whale, oysters, fish fertilizers, etc., etc."

TROUT FROM SUNAPEE LAKE.—There are now on exhibition with William Mills & Son, 7 Warren street, New York, three stuffed specimens of fish belonging to Mr. J. D. Quackenbos, which will interest anglers. One is a seven-pound specimen of the new trout from Sunapee Lake, New Hampshire, of the blue-back or Oquassa type concerning which much has been said in our columns by Mr. Quackenbos, Col. E. B. Hodge, and others. A brook trout of six pounds weight is also shown, and the third fish is a male landlocked salmon of the planting of 1877 which weighed twelve pounds.

IMPROVED SALMON.

Editor Forest and Stream:

The article under above heading in FOREST AND STREAM for Feb. 3 opens a most interesting question. The influence of domestication on the sexual development of the Salmonoids has long been to me a subject for inquiry and experiment; so also has the influence generally which the introduction of fresh and often alien blood brings to bear on the habits and final type of the original inhabitants of a stream, whether trout or salmon.

Instances connected with trout (*S. fario*) have frequently cropped up, which seem to point to a loss of pluckiness and characteristic wildness under domestication. In all cases where a stream has been for a long series of years replenished with young hand-reared trout, the adult and takable fish seemed to grow gradually tamer though not less wily so far as the angler was concerned. Furthermore—and this is remarkable if it be found to be a truth—I was led to think that domestication was the direct cause of barrenness, from the fact that so many fish handled during spawning time were devoid of organs of generation, and were supplied with them only in an elementary condition. This conclusion was reached on a river in the south of England noted for its large, splendid breed of *fario*, some miles of which were under my absolute control. I asked if this fact had been noticed by other observers through the columns of a fishing journal, and a well-known fish breeder undertook to deny the inference I drew. The occupation of that man would have certainly been gone had it been a fact that artificial breeding tends to weaken the natural breeding powers, and I felt satisfied at the time that sufficient attention had not been directed to the subject. It was, in my experience at least, an otherwise inexplicable fact that from my stream, which had been largely stocked with fry each year for many years, the percentage of barren fish was quite ten per cent., while a contiguous stream never stocked showed less than one per cent. of such fish on careful calculation.

Again, I know it to be a fact that crossing a good strain of fish—large and gamy—with a smaller breed, improves the latter but deteriorates the former. "It needs no ghost come from the dead to tell us this," the reader will say. Then why, I ask, is this truth ignored by fishculturists, in England at least? The Thames trout are a *fario* of unrivalled beauty and pluck, and going up to 15 and 16lbs. weight, and because they are scarce the sapient anglers and fishculturists of its neighborhood insist on introducing a *fario* of distinctly inferior size, never, in fact, growing over 5lbs. The experiment is bearing fruit now in more trout and inferior average size. Thirty years ago, when my father was held to be the champion trout fisherman of the Thames, 10 and 12-pounders were common; now the average is nearer 4lbs. *Verb. sap.*

J. HARRINGTON KEENE.

SIZE AND AGE OF TROUT.

Editor Forest and Stream:

The publication by the FOREST AND STREAM of a private note has given more length to the discussion of age and size of trout than was intended. Perhaps, however, it was a subject of sufficient importance to warrant further notice. The authoritative if not lucid response from Utica, accompanied by some discourteous reflections upon Jefferson county anglers, ought to settle the matter in some way, although the article by Mr. Mather would seem more satisfactorily conclusive. He, however, makes the admission "there is no way to tell the age of wild fish."

We must again premise that it was the size of trout in the spring of the third year that was the question, and not at three years of age, leaving, we suppose, some margin of difference in possible growth. Mr. Mather admits, we think, that in the spring of the second year trout would not reach 6in., but places that measurement at the age of 1½ years, so that assuming there would not be much growth from the latter part of the second to the opening of the third year, we were perhaps not so far out of the way in our fear that they would not measure quite 6in. at the date in question. The Utica "authorities" seem to regard this a very wild guess.

As to the "conditions" being good where we fish we cannot pass an intelligible opinion. During the past two seasons the fishing has been upon the upper waters of the Oswegatchie and Mad rivers, and we supposed we were stating facts when we said that 6in. trout did not frequent the riffles—allowing proper latitude for the "frequent." Less than 2 in 10 of legal trout has been the average, leaving 8 out of 10 to be returned to the water mutilated, with pierced eye or bleeding gill, to take their chance with life anew. Other fishermen may have had similar or different experience, but at the close of our day's sport the spoil has been so meagre that our share has been donated to fellow fishermen to swell their catch and make one respectible whole, while we have borne in meekness the gentle chaffing of home. We do not wish to moralize over this matter, but we suppose all slaughter would be unbearable but for the spoil. What gunner so hardy as to slay his victims only to leave them uncared for and untouched? Make the law 7in. as intimated by the authorities mentioned and many an angler, possibly not all, would be placed in still greater perplexity. As to 7in. trout frequenting our riffles we would state as a cold fact that we have heretofore taken 40 fish in a day's catch, not one of which would measure it. Anglers who have means and can afford to go far, or who have choice localities largely controlled by them where large fish abound, should not, we think, lose sight of the probability that it will be difficult to control the poor fellows of moderate circumstances who go out for a day to take a few trout, and it may not be wise to go too far in fixing limits that would practically debar their catch, as would a 7in., 8in., or 10in. law (where will the matter stop?), forcing them to believe the law unreasonable or unjust.

In conclusion, we believe protection should be afforded during two years for very obvious reasons, and are willing to rest the matter there. If the hoped for 6in. requirement is made a law, we shall be found quite as faithful, we trust, in its observance as members of Utica's F. and G. P. A. ANGLER.

GAME PROTECTOR LINDLEY.—New York, Feb. 4.—*Editor Forest and Stream:* As I usually make several trips each season to Oneida Lake, New York, I was interested in your editorial of Jan. 6 regarding protector Lindley. About every time I have been there his visits were the gossip of the day, and his steam launch could frequently be heard at night or seen during the day, scouting around the fishing grounds or looking after illegal duck shooters in the fall. Many yarns of the narrow escapes from Lindley have been spun by the "natives" for the edification of our party, and from my observations I am sure that they doubt not his bravery, and fear his coming; and I only wonder in the face of all he has to contend with that he or any one else accept the appointment for the paltry sum allowed by the State. That he takes his life in his hand whenever he goes out to the lake is undoubted, and that he has been fired at and looked down the muzzle of double-barreled shotguns is asserted by the net-fishermen. I recognize the fact that when a man accepts the appointment he should be held strictly accountable for its proper fulfillment; still, I think, particularly in this case, the district is much too large, and if he were confined to the Oneida Lake exclusively, and the expenses of his steam launch allowed him by the State, he would soon stop this illegal fishing. When you take into consideration the large number of people on the shores of the lake engaged in fishing and the profits derived from it, you can readily see the difficulty of a conviction. That you will understand that I have no interest in this matter or Mr. Lindley beyond the protection of fish and game I will say that I never met him, nor have I any acquaintance whatever with him, and stand ready to contribute toward his loss in the difference between what his expenses were and what was allowed him for 1886. I inclose clipping from the Syracuse *Standard* of Jan. 28, as follows: "W. H. Lindley, of Canastota, State game protector for this district, on Wednesday received judgment in Madison county against William Case, Fred Wright, DeWitt Wager, Edward Jacobs, John Springer and William Phillips, all of Lakeport, for $100 each and costs, for catching fish in nets in Oneida Lake in violation of the game law. Such convictions represent thorough and difficult work on the protector's part, as the poachers are apt to make all possible trouble for those who might testify, by destroying or damaging their property."—JEEMS.

AN OLD TROUT.—The Elmira, N. Y., *Advertiser* reports that a brook trout belonging to James Sherman, of Lafayette, N. Y., is dead. It was undoubtedly the oldest trout of which there is any record. It was put in a well on the Sherman place thirty-five years ago last summer, and was at least a year old then. It began to show the effects of old age five years ago. Its spots faded away, it became a dull gray color, and began to shrink in flesh. It weighed less than 4lbs. when it died. It was at one time two pounds heavier.

RE-NUMBERING OF FISH HOOKS.

Editor Forest and Stream:

Referring to your remarks in your issue of Dec. 30.

Although my firm claims to be the largest fish hook and tackle manufacturers in the world, they do not ask tackle dealers or anglers to adopt their system of numbering. In Redditch, which is the principal seat of the trade, all the manufacturers of any repute have one uniform system of numbering all standard patterns of fish hooks which are well-known by fishermen, and to change that system to which anglers have been accustomed for the last half century would cause great confusion, and simply mean an absence of system of numbering.

Uniformity of all pattern hooks and sizes never will take place so long as anglers introduce modifications of various standard patterns, each claiming his modification as "the best killing hook." These new pattern hooks are noticed by authors of books on angling, and illustrations are given with the numbers or sizes adopted by the introducer, and when ordered the manufacturer is bound to make them according to that particular size and shape given in the illustrated notice, whether it is the Redditch or Kendal system of numbering.

It is not a question of expense of altering the system in use by my firm. If it were possible to compel every one to conform to one system of numbering it would be much better for us, but only a person of utopian ideas will ever dare to hope for such a reform.

The reform "Mechanic" advocates is rather one for the wire manufacturers than for the hook manufacturers; but, if this was carried out, it would be much better to adopt the metrical system than to use the inch as the standard. The inch after all is only an arbitrary measure, no better than the notch which he imagines Stubbs to have filed in a piece of steel. The metre, as a definite portion of the earth's radius, has a much better *raison d'être*. But, after all, the change in numbering would have very little practical use, unless one could persuade all fishermen to adopt one pattern of hook. Then the proportion between the size of the wire, the length of the point, and of the shank and the width and shape of the bend might be expressed by a number. But this will never be done; for, without counting the whims and fancies of fishermen, many different shapes and proportions of hooks are absolutely necessary to suit different kinds of fish, different styles of fishing and the different baits used.

The person who has been the chief agitator of this question, who has written and caused to be written a great deal of nonsense on this subject, has at last disclosed his reasons for doing so. In a letter which he has just published, he says he has appointed an agent for the sale of his hooks, and in a letter which he has addressed by post to fishing tackle dealers, he has touted for orders for this agent.

It remains to be seen if fishermen will allow themselves to be led, under pretext of re-numbering hooks and such other nonsense, to pay an extra price for their hooks, simply to allow some one to step in between themselves and the legitimate salesmen and draw a commission for writing up a particular make of hooks.

AMERICAN FISH EGGS FOR ENGLAND.—Fisheries Commissioner Eugene G. Blackford has shipped via the White Star steamer Adriatic 1,500,000 whitefish eggs and 10,000 brook trout eggs to the National Fishculturist Association, of South Kensington, England, as a present from the United States Fisheries Commissioner, in return for a shipment of Loch Leven trout received from the European association. The eggs were packed under the supervision of Commissioner Blackford in large cases. The eggs were placed in single layers in wooden trays, the bottoms of which were made of Canton flannel. Thirty-five thousand eggs were placed in each tray, and the trays were placed one above the other and were then packed with ice and sawdust. The object of the ice is to retard the development of the eggs, so that they will reach Europe in good condition to go into the hatching trough in South Kensington.

NEW HAMPSHIRE.—United States Fish Commissioner Baird has presented to the New Hampshire Fish Commission 100,000 Penobscot salmon eggs, 30,000 landlocked salmon eggs, 5,000 Saibling trout eggs, 5,000 brown trout. Dr. Quackenbos, of New York, has also presented 30,000 Loch Leven trout eggs brought from Scotland, the product to be placed in Sunapee Lake. Nearly 2,000 eggs will be hatched this spring at Plymouth and Sunapee hatching houses, which will be distributed in the waters of the State.

THE TEN-INCH LOBSTER LAW.

A BILL has been introduced in the New York Legislature to repeal the law which forbids the sale of lobsters which are under 10½in. in length, exclusive of the claws. We do not know in whose interest this is done, but it is certain that it is not in the interest of lobster protection. The law, as it stands, is a wise measure to prevent the destruction of infant lobsters and to keep up the supply of a valuable food animal which is now extinct in some waters where once it was plenty, and is becoming scarce in others. The supply of lobsters is decreasing both in numbers and in the weight of individual specimens. Twenty-five years ago the sizes of lobsters in the markets ranged from 2 to 10lbs., averaging about 4; now they range from 1 to 3lbs., averaging perhaps 1¾, for the smaller outnumber the larger ones.

At the eleventh annual meeting of the American Fisheultural Association, held at the Directors' Room of the Fulton Market Fish-Mongers' Association, in New York, April 3and 4, 1882, Mr. S. M. Johnson, of Boston, a large lobster dealer, sent a letter to Mr. Blackford on this subject, which appears in the report of the Association for that year, page 41. In that letter Mr. Johnson says: "We are making sacrifices of future good to gratify present demands. In using these small lobsters we are hypothecating our stock in trade and cutting off our future supply. * * * I wish to put myself on record as advocating a just and wise law for the preservation of lobsters."

Mr. Blackford said: "Mr. Johnson is greatly interested in the 10½in. lobster law, as the only way to preserve the lobster fisheries. Last year [1881] lobsters sold as high as twenty-five cents per pound at retail and even higher. Small lobsters are sent here for sale, notwithstanding the law against it, and many go to New Jersey, where there is no law on the subject." Many fish dealers in Fulton Market were present at this meeting and approved the remarks of Mr. Johnson.

The argument, as we understand it, in favor of repealing the law is that the small lobsters now go to New Jersey and that New York might as well have them. This is no argument at all, merely an excuse, and only shows that New Jersey should pass a similar law. Maine cried out for protection for her depleted lobster fisheries and passed laws forbidding the killing of the infants. Massachusetts did the same, and these two States, the principal lobster producing ones, called on New York to close her markets to all lobsters under the above named limit. This was done, and it only needed other States to fall in line in order to give the little lobsters a chance to grow to a size profitable to both fisherman, marketman and consumer.

Now comes Assemblyman Finn, of New York, who says that the fish dealers of his district demand the repeal of the so-called "Dunnell Law," which protected the lobster in its infancy. His bill ought to be squelched in committee.

THE WISCONSIN COMMISSION.

THE second biennial (11th) report of the Commissioners of Wisconsin for 1885-86 is prefaced with a view of the new hatchery and ponds at Fitchburg, near Madison, which gives a good idea of the appearance of the grounds. The report says that the new hatchery will compare favorably with any in America and that in the successful propagation of trout and pike Wisconsin leads all competitors, although in the planting of whitefish, Michigan with her several hatcheries, liberal appropriations and long experience, leads. The enormous flow of clear cold water at the Nine Springs hatchery, which comes from at least a dozen springs, will admit of more than double the present hatchery capacity, provided the Legislature furnishes the means.

The report of Mr. James Nevin, the Superintendent, makes an excellent showing. From him we learn that the new hatchery is the most convenient of its kind on the continent. It is 100x25ft. The main building, used for hatching purposes, is 88x25ft. Under the floor of this part is a raceway extending the whole length and covered with gravel, over which a strong current of spring water is constantly running. When the fish in the large pond immediately below are ready to spawn, they naturally seek the rapid water, and by means of trap-doors forming part of the main floor in the building, are readily caught and handled, thus saving an immense amount of time and labor and unnecessary handling of the fish.

The following are the numbers of fish shipped in the respective years: Brook trout, 1885, 1,520,000; 1886, 2,275,000; rainbow trout, 1885, 600,000; 1886, 620,000; wall-eyed pike, 1885, 14,550,000; 1886, 345,000; German carp, 6,065. Of Mackinaw trout (lake trout) there are this winter 1,000,000 eggs on the hatching trays. For a number of years the Commission did not hatch any of these fish, as it was thought that the fry did not show up to advantage, but during the past summer quite a number were caught in the lakes at Madison weighing from 5 to 8lbs. each, and the fishermen report seeing them there by the thousand.

Of the brown trout 1,000 eggs were received from Cold Spring Harbor, N. Y., last April. They came in fine condition, and hatched the following day, and were kept in the hatchery six weeks with little loss.

At the branch hatchery in Milwaukee there are now some 50,000,000 whitefish eggs, the largest number obtained since the organization of the Commission, although great trouble was experienced in getting them on the lakes on account of the stormy weather. In 1886 the following plantings of whitefish were made: Milwaukee harbor, 15,120,000; Fort Howard harbor, 9,450,000; Ashland harbor, 2,250,000; Green Bay, 2,700,000; Manistique, 2,610,000; Waupaca, 450,000; Medford, 450,000; Madison, 180,000. Total, 33,210,000.

Fishermen have complained of the scarcity of large whitefish, and the great quantity of small ones, for which they get little or no price. In the neighborhood of Green Bay over two hundred tons of whitefish were taken that weighed less than a pound each, and fully twenty-five per cent. not more than a quarter of a pound, and for these the fishermen could only get from one to two and a half cents a pound.

Two years ago the Legislature passed a law regulating the size of the meshes in the pound nets. When the first bill was drawn it was "iron-clad" for a 4in. mesh. Senator E. S. Minor, who has taken a deep interest in the fisheries, had the bill sent to the fishermen throughout the State. All acknowledged that the pound nets required regulating, but said that they could not afford to go to the expense of new pots for them. Mr. Minor, after consulting with various parties, came to the conclusion that "half a loaf was better than no bread," and the bill was compromised by allowing two sides of the pot to remain as they were, and the other two sides to be 3½in. mesh. This, however, has done little or no good, for the fishermen in lifting their nets, instead of drawing up the side with 3½in. mesh, and allowing the small fish to escape, lift the fish on the smaller mesh and take everything, small and large, thus violating at least the spirit of the law.

Mr. Nevin says: "I claim that were it not for our Milwaukee hatchery and those of the State of Michigan, there would be no small fish for them to catch. Where do they come from? If, as the fishermen complain, there is a great scarcity of the larger ones or breeders, there being now only one caught where four years ago there were ten, it stands to reason that these younger ones must be the fruit of the United States, Michigan and Wisconsin hatcheries, and unless the law is altered so as to strictly prohibit the present fearful havoc among the young fish, I would recommend the closing of the Milwaukee hatchery. It seems a useless expense to raise millions of fry and turn them into Lake Michigan to be caught when they weigh from one-quarter to three-quarters of a pound, and bring no more than from one to two and a half cents a pound. By altering the law so as to have a uniform size for the meshes of 3½in. or more, or else making it unlawful for fishermen or dealers to sell or buy whitefish of less than a pound in weight, it would enable the young fish to attain such an age as to propagate and such a weight as to bring a remunerative price."

An appendix to the report gives the laws now in force respecting fish, fishculture, fishways, etc., in Wisconsin, and the report concludes with a notice of the death of one of the Commissioners, Mr. James V. Jones, of Oshkosh, who died suddenly on Jan. 6, 1887, aged 60 years, after the report which he had signed was printed.

THE VERMONT COMMISSION.

THE biennial report of the Fish Commissioners of Vermont for the year 1875, is a very interesting document. The survey of the waters and streams of the State has been largely extended. As the State appropriation was insufficient to do many desirable things the Commission has been aided by the United States Fish Commission, and by joining with New Hampshire procured eggs and fry at reduced rates, and, by contracting, in some instances fish have been planted in the ponds at one-fourth the usual cost. The State owns no hatchery, yet individuals have been successful in hatching several species of fish, and it is hoped that in the future a considerable supply will come from such sources.

Since the last report there have been planted 70,000 landlocked salmon; 224,000 Penobscot salmon; 70,000 brook trout; 10,000 California trout, and 40,000 lake trout. One hundred and thirty-four ponds have been stocked with carp from which very good results are reported. Twelve hundred black bass have been put in many waters, and in some cases where it was considered that the food supply was insufficient, rock bass were placed with them for the black bass to feed upon. It is a question, however, if these rock bass will prove to be as desirable for the black bass as some of the softer finned fishes, such as chubs and dace.

A list of ponds of the State is much more complete than any former list. Some of these were visited and surveyed, and others are located and described from information given by fish wardens, town clerks and others. This list gives the names of the ponds, town where situated, description, such as clear, gravelly, muddy, etc., the kind of fish inhabiting it, and its area in acres. This is followed by a description of the creeks, brooks and rivers, which appears to be quite full.

There has been great improvement in the enforcement of protective laws; a large majority of the towns have appointed fish wardens, and their work has had a good effect, even though in some cases prosecutions have not ended in convictions. Three of these wardens make reports of seizures of nets, or their destruction, and of men arrested and fined for having fish in possession out of season. An appendix gives laws for the preservation and propagation of fish, game and birds, and also special enactments for the protection of fish in certain described ponds.

NEW YORK FISH HATCHERIES.—Utica, Jan. 29.—*Editor Forest and Stream:* The present season bids fair to be a remarkably favorable one at the various State fish hatcheries. Supt. F. A. Walters, of the hatchery at Lake Brandon, in the Adirondacks, writes that there are 430,000 brook trout and 800,000 salmon trout eggs on the trays. Some have already hatched and the fry are very strong and healthy. There are also 20,000,000 of frost fish at the hatchery, kept in Chase hatching jars. Half a million eggs of the Penobscot and landlocked salmon eggs procured from Maine are expected to arrive soon. The temperature of the water in the hatchery has kept nearly uniform at thirty-six degrees above zero thus far, while the temperature of the air outside has sometimes been as low as thirty degrees below. This shows an admirable quality of water for fish hatching purposes. Superintendent Walters is confident that the hatching at this station will be as successful as any ever done in the State.

WHY THE CARP DIED.—Mr. W. H. Turner, who has twelve large ponds stocked with carp, says in the Cincinnati *Enquirer:* "In the five years that I have been raising carp I have had none to die. I am always very careful to keep a hole some four feet square open every day when the pond is frozen over. One of my neighbors lost all his fish in this wise: His pond froze over, and the water came in on top of the first ice and froze a second time. He forgot to cut through the lower ice, and when the ice melted his fish were all smothered. I have another neighbor that never cut a hole in his pond, and when the ice melted his fish were all dead. I think it is very essential when the ponds are frozen over that the fish have air every day."

The Kennel.

FIXTURES.

DOG SHOWS.

Feb. 8 to 11.—Southern Massachusetts Poultry Association Dog Show. Fall River. A. R. G. Mosher, Secretary.

March 8 to 11.—Second Annual Dog Show at Buffalo, N. Y. J. Otis Fellows, Secretary, Hornellsville, N. Y.

March 22 to 25, 1887.—Spring Show of the New Jersey Kennel Club, Newark, N. J. A. C. Wilmerding, Secretary, Bergen Point, N. J.

March 29 to April 1, 1887.—Inaugural Dog Show of Rhode Island Kennel Club, Providence, R. I. N. Seabury, Secretary, Box 1333, Providence.

April 5 to 8, 1887.—Third Annual Show of New England Kennel Club, Boston. F. L. Weston, Secretary, Hotel Boylston, Boston, Mass.

April 12 to 15, 1887.—Thirteenth Annual Dog Show of the Western Pennsylvania Poultry Society, at Pittsburgh, Pa. C. B. Elben, Secretary.

April 19 to 22.—Annual Dog Show of the Philadelphia Kennel Kennel Club. E. Comfort, President.

April 26 to 29.—Second Annual Dog Show of the Hartford Kennel Club. A. C. Collins, Secretary, Hartford, Conn.

May 5 to 6, 1887.—Eleventh Annual Show of the Westminster Kennel Club, Madison Square Garden, New York. James Mortimer, Superintendent.

FIELD TRIALS.

Feb. 15, 1887.—Inaugural Trials of Tennessee Sportsmen's Association. Entries close Jan. 10. R. M. Dudley, Secretary, No. 84 Broad street, Nashville, Tenn.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **4606.**

THE COLLIE STUD DOG STAKES.—Philadelphia, Feb. 7.—*Editor Forest and Stream:* The Executive Committee of the Collie Club desire to make a change in the Stud Dog Stakes. The entrance fee has been changed to $10, and the owner of the stud dog is to state the service fee, which fee he agrees shall stand for the balance of the year. In other respects the conditions are as you have already published.—GEORGE A. SMITH, Sec. and Treas.

THE EASTERN FIELD TRIALS CLUB.

THERE was a meeting of the Board of Governors of the Eastern Field Trials Club at the St. James Hotel, New York, on Tuesday evening. The committee on revision of the running rules reported that Rule 4 relative to the age of Derby entries be stricken out, as the rule is given in announcement of the stake. To the rule describing the manner in which the dogs shall be run is added that they shall be hunted as in ordinary shooting. Regarding the exclusion of bitches in season is added, "or unduly attracting the attention of the competing dog." Rule 21 (now Rule 20) is changed to read: "The last dog beaten by the winner of the first prize shall compete for the second prize with the best of those dogs previously beaten by the winner of first prize. The winner of this heat shall be declared the winner of the second prize. The discretion is given to the judges of deciding which is the best of these beaten dogs in the competition for second place by selection or by running extra heats between them. After the first and second winners are ascertained, the judges may name the winners of any other prizes from any of the dogs in the stake without further running." In instruction to judges, in the sentence "A dog drawing on or pointing game shall be afforded ample opportunity to locate the game without competition," the words "without competition" are stricken out. A new rule as follows was added: "Rule 21. The last dog beaten by the winner of first prize shall not be obliged to run more than two heats on the same day, but at the option of his handler may run the final heat for second place on the following day." It was voted that the above changes be adopted.

Messrs. A. M. Hunter, New York, and J. N. Cochran, Philadelphia, were elected members. It was voted to offer the usual medals for field trial winners at the coming show of the Westminster Kennel Club.

It was decided to hold the field trials of 1887 at High Point, N. C., beginning Monday, Nov. 21, with the Derby for pointers and setters whelped on or after Jan. 1, 1886, with $400 to first, $200 to second, and two equal third prizes of $100 each. Also a breeders' cup, value $100, $10 forfeit, $20 to fill; entries close May 1.

The next stake in order is the All-Aged Setter Stake, with $300 to first, $150 to second and two equal third prizes of $50 each, $10 forfeit, $20 to fill. Entries close Oct. 1. The All-Aged Pointer Stake comes next with the same prizes and conditions as the setter stake. To close with the champion sweepstakes, $10 forfeit, $15 to fill, with $100 added. Entries close Oct. 1, except to winners of this year. The Members' Stake will begin Nov. 17; $100 to first, $75 to second and $50 to third. Entries close evening previous to running.

THE AMERICAN MASTIFF CLUB.

THE American Mastiff Club offers a challenge cup valued at $150, for the best mastiff dog or bitch bred in America. Following are the rules that will govern the competition:

I. This prize shall be offered for competition at a show in the spring of each year, to be selected by the Executive Committee of the American Mastiff Club, due notice of which shall be given by publication.

II. The competition shall be open to all American-bred mastiffs in the Champion, Open or Puppy classes which are entered for that purpose with the Secretary of the American Mastiff Club, within the same limit of time that entries are open for the show at which the competition is to be held.

III. The dam of any competing mastiff must have been owned and resident in this country the four consecutive months prior to the whelping of the competitor.

IV. A guaranty will be required for the return of the cup, in good condition, to the Secretary of the Club, or his order, at least one month before the next competition.

V. A silver medal will be presented to the winner, and in the event of an owner winning the cup three times with the same dog, he shall be presented with a gold medal, and shall have the option of duplicating the cup at his own expense.

Challenge cups for American bred mastiffs are offered, open to members only, under the following rules:

I. There shall be two challenge cups of the value of $100 each, one for the best mastiff dog, the other for the best mastiff bitch, the property of any member of the American Mastiff Club.

II. These cups shall not be offered for competition at any show where champion classes are not provided; nor shall they be competed for oftener than four times in the course of a year. The competition shall be open to all dogs in the champion, open and puppy classes.

III. A silver medal shall be presented to any member winning either of the cups. In the event of a member winning either cup three times with the same dog, he shall be presented with a gold medal.

IV. A member winning either cup three times with any dog or bitch, shall have the option of having a duplicate made at his or her own expense.

V. The winner or winners of the cup or cups having it or them in his or her possession shall be responsible for their safe custody, and in case of the loss of either or both of them by fire or any other means, shall make good the loss thereof. But it shall be at the option of any member winning the same to allow them to remain in the custody of the club.

VI. The winner or winners of the cup or cups shall be entitled to retain possession thereof until fourteen days prior to any show where the same are to be competed for, and on the written application of the secretary shall within seven days return the same to him.

VII. In the event of the dissolution of the club the cups shall be returned by the last winner thereof to the committee and be treated as the property of the club.

There will also be a puppy sweepstake for all mastiffs born in the United States and Canada on or after March 1, 1886. Open to members only. Entrance $5 each, to be paid to the secretary of the American Mastiff Club at the time of entry. The sweepstakes to be decided at a show in the spring of 1887, to be selected by the Executive Committee of the American Mastiff Club. The winner to receive 75 per cent. of the sweepstakes; 25 per cent. to go to the second.

In entering dogs for the show, at which it is decided to hold the mastiff sweepstakes, it will be necessary to enter them according to the regulations of that show, in their regular classes and also specifying on the entry blank that they are "to compete for the mastiff sweepstakes." Entries close March 1, 1887.

Mr. R. H. Derby, 9 West Thirty-fifth street, New York, is the Secretary.

FAKED REPORTS.—*Editor Forest and Stream:* After the close of our late bench show in this city I sent a Chicago contemporary a report of the same, and included in it some complimentary references to the judge (Mr. Chas. H. Mason), which were well merited in my estimation, and in that of all the exhibitors, with, I believe, not one single exception. The Chicago editor, for reasons obvious to all, "faked" the report. After this I sent the same editor a copy of a set of resolutions passed by our club at a regular meeting, indorsing Mr. Mason as a judge, and setting forth the great satisfaction he had given the club. For the same reasons as those which prompted him to fake the report of our show, the Chicago manipulator refused to publish the resolutions. His conduct in this matter is a direct insult to respectable journalism as well as to our club, and I feel it to be my duty to give these facts to your numerous readers, so that they may attach the necessary amount of importance to his reports which have appeared or which may appear of shows judged by Mr. Mason.—H. W. WILSON, (St. John, N. B. Feb. 5),

THE YORKSHIRE TERRIER.

IN commencing an article on the Yorkshire terrier, it is necessary to trace back their origin as far as possible. With this object in view, I have been at some trouble in looking up several old fanciers, one of whom, John Richardson, of Halifax, is now in his 67th year. And very interesting it was to hear this aged man go back to the "good old days" of over half a century ago. I regret, however, that, although we can find men who have been in the fancy so long, the origin of the present Yorkshire terrier is somewhat obscure. Fifty years ago there was in Halifax and the immediate neighborhood a type of dog called at that time (and even within these last twenty years) a "Waterside Terrier," a little game dog, varying in weight from 6lbs. to 20lbs., but mostly about 10lbs. weight—a dog resembling very much the present Welsh and Airedale terrier on a small scale. At this period these dogs were bred for the purpose of hunting and killing rats. They would go into the river and work with a ferret, and were just in their element when put into a rat pit. An almost daily occurrence at that time was to back them to kill a given number of rats in a given time. It seems almost a pity that such a breed should have become extinct. Mr. Richardson himself owned a little bitch called Polly, who weighed 6lbs., and she was frequently put into a rat pit with a dozen rats, the whole of which she would speedily kill against time. She would also swim the river and hunt with the ferret. This little bitch, I am told, had four or five inches of coat on each side of her body, with a white or silver head. At that time, however, the average specimen was a shorter-coated dog, with grizzle-gray, hardish coat. It, however, seems to me, and is also the opinion of many old fanciers whom I have consulted, that they were the ancestors for the present breed. There is no doubt, also, that the blood of the Skye terrier was introduced at some remote period, which may account for the longer coat and long body that existed some ten or fifteen years later. No care or definite object, however, seems to have been aimed at in breeding at this time beyond getting a dog thoroughly game. It seems that it was more by good luck than management that about twenty or thirty years ago a longer and softer-coated dog became known. It must also be borne in mind that at this time their coats were not cultivated as they were later on. Dog shows were almost unknown in those days, and even later were scarce.

We now come to about twenty-three years ago, when shows became frequent, and classes were made for this breed under the name of "Scotch Terriers," and, in fact, it is only very recently they were properly named the Yorkshire terrier. About the first to make a name at this time was Mr. John Inman, of Brighouse, one of the most respected and best judges of the breed now living, and to whom I am greatly indebted for much of this early information. Just twenty-two years ago Mr. Inman was at the top of the tree with a little dog called Don, weighing 6lbs. This little dog had on his sides about 9in. of hair, of a good blue color, and the head and legs were a wonderfully rich golden tan. This little dog won eighteen prizes, and was sold to Mr. Peter Eden, of Manchester, for whom he also won a great number of prizes. This dog takes us as far back in the history of the breed as I am able to trace any of note, and he is doubtless responsible for many good dogs since. But, to show the difference in sizes that were allowed, I will mention that Mr. Inman, about the same period, won nearly forty prizes with a dog called Charley, which weighed over 14lbs. About this time, Mr. Inman informs me, richness of tan was considered indispensable, and he is strongly in favor of color over coat. A Mr. J. Dewhurst, of Halifax, Mr. Dinsdale, and Mr. Teal, of Leeds, and one or two others were about the only exhibitors at this time, three or four being an average number of entries at shows; and most of the exhibits were on the big side, some of them weighing over 15lbs. each.

Then became very common a breed of dog peculiar to Leeds, a sort of cross between a Maltese and wire-haired fox-terrier, taking after the latter in build, and the former in quality and quantity of coat, and it is presumed they were crossed with the strain of Scotch or Yorkshire terrier. The result was a dog much on the lines of the present Yorkshire terrier, but almost white or silver-haired, having no tan but a vast quantity of hair, and these were called "Silver-haired Terriers." Classes were provided specially for them at some of the leading shows, but I am pleased to find they are fast dying, and that the fancy is fast returning to a class more resembling the old breed of blue-and-tans. It is just about twenty years ago that a dog called Huddersfield Ben made his appearance. He weighed about 9lbs., and belonged to Mr. J. Foster, of Bradford, the well-known exhibitor of the present day. Huddersfield Ben was, perhaps, the nearest approach to the present Yorkshire that then existed. He was not a very good tanned dog, and not anything like so heavy coated as some. As a sire he proved very valuable, a great many of the present winners having his blood in their veins, this dog and Inman's Charley having the run for several years, both at stud and on the show bench. It is not necessary to go further, as from this date the breed was firmly established, and has continued to progress, each breeder vying with another to produce a superior animal. There can be no doubt that the present breed are very much in-bred, in fact, as I have stated, the breed is confined to Halifax and its immediate neighborhood, so it is almost impossible to breed from dogs that have not some relationship. This accounts in a great measure for their delicateness and smallness, and very few of them would now look at a rat, much less kill one.

Even if they were disposed to it would not be wise to permit it, especially with small and valuable dogs, for fear of accidents. It is a great mistake to imagine that it is necessary to breed from long-coated and small specimens to produce the like, as bitches of 16lbs. weight have bred toys weighing only 3 or 4lbs. when full grown; while bitches of 5lbs. weight have bred dogs that have reached 14lbs. when matured. They are constantly throwing back, no matter how good and well chosen the parents. In a litter of Yorkshire terrier pups, when they are grown, I select the largest bitch of the lot, irrespective of quality, and I put her to a small dog of the best blood. I am quite as likely to breed high-class specimens in this way as if I breed from the best bitch ever seen on the show bench. In fact a bitch with a long coat would be ruined while having the care of a family. I have known really high-class winning bitches that were own sister to a rank bad one, so far as appearance went; but I would just as soon breed from the worst looking one, if put to a really good dog—and the dog above all others that I should select would be one that was most likely to produce richness of tan on head and legs.

Perhaps one of the most remarkable features in connection with this breed is that the pups, when born, are quite black and smooth-coated, like a black and tan terrier. It has been my lot, on more than one occasion, to sell a Yorkshire terrier bitch in pup to a first-class dog, and afterward to receive a most insulting and indignant letter saying the pups were mongrels, and had, in consequence, been drowned—simply because they were black. In fact, so little knowledge exists in some parts of the country of the peculiarities of this breed in their early days, that I do believe some people expect them to be born with a long silky coat, ready parted, etc., simply because they never see this breed except when on the show bench. Yorkshire terriers might, in fact, be called the Halifax terrier, seeing they are almost exclusively bred in Halifax or the environs, and even when bred in other towns they can always be traced back as coming originally from Halifax. Very few outside the fancy can imagine the tremendous amount of care and attention that have to be given to this breed before they are good enough to make a name in the prize ring. I have known men spend many long years in breeding, and still never have one good enough for competition. This is, no doubt, one of the chief reasons that account for the scarcity of good winning Toys. Where one champion turns up fifty others are only very average specimens. Still, it must be borne in mind, that even the good ones are not got to perfection without continuous labor and care. Another reason for their scarcity is the large and continual demand from all parts of the world for these little beauties. It is a remarkable fact that they are mostly bred by workingmen. The result is, that as soon as the puppies begin to show their quality they are mostly purchased by others and sent to all parts of the country to be afterward lost sight of. I have myself sent over 300 away during the past twenty years, and only a few days ago sold five very choice specimens, two of which are going to India, one to America, and another to Africa, while the other remains in London. This shows how they are admired all over the world. I must also note that far more good specimens die than are reared.

It is not the actual scarcity, however, of this breed that makes the classes so poorly filled at some of our leading shows. But it is absolutely necessary that some one should go with them to exhibit them to the best advantage, and also to attend to their coats and general comfort, as a few days' neglect can easily do more harm to a good heavy-coated dog than many weeks of care and attention could remedy. Another great reason for personal attendance is that the "best dog does not always win," and I think it most unfair for gentlemen to undertake to judge this or any other breed if he does not feel himself thoroughly competent to do justice to the post. There can be no question about it that the Toys are the chief attraction of a show, and it is a pity more care is not taken to give them "fair play" and let the best dog win, no matter "whom it belongs to." Gentlemen are invariably selected to judge this breed who probably never see one except when on the show bench, and, to speak plainly, it is positively painful to see the way they are misjudged at some of our leading shows. I am very pleased, however, to find that many judges have studied the points of the breed, and are trying as quick as possible to become proficient. Just recently, also, there has been formed a Yorkshire Terrier Club. The first meeting was convened during the Halifax Dog Show last year. Mr. J. W. Berrie, of London, afterward elected as president, had worked hard to get the fancy together, and gave me all the assistance in power, I acting as secretary *pro tem.* A very good meeting was the result, and after many other meetings a standard of points was drawn up and finally settled as follows:

General Appearance.—This should be that of a long-coated pet dog, the coat hanging quite straight and evenly down each side, a parting extending from the nose to the end of the tail. The animal should be very compact and neat, the carriage being very "sprightly," bearing an important air. Although the frame is hidden beneath a mantle of hair the general outline should be such as to suggest the existence of a vigorous and well-proportioned body.

Head.—This should be rather small and flat, not too prominent or round in the skull; rather broad at the muzzle, with a perfectly black nose; the hair on the muzzle very long, which should be a rich deep tan, not sooty or gray. Under the chin, long hair, and about the same color as the center of the head, which should be a bright golden tan, and not on any account intermingled with dark or sooty hairs. Hair on the sides of the head should be very long and a few shades deeper tan than the center of the head, especially about the ear-roots.

The *eyes* should be medium in size, dark in color, having a sharp intelligent expression and placed so as to look directly forward, but should not be prominent. The edges of the eyelids should also be of a dark color.

Ears.—Cut or uncut; if cut, quite erect; uncut, small, V-shaped, and carried semi-erect. Covered with short hair. Color to be a deep dark tan.

The *mouth* should be good and even; teeth as sound as possible. A dog having lost a tooth or two through accident, not the least objectionable, providing the jaws are even.

The *body* should be very compact, with a good loin, and level on the top of the back.

Coat.—The hair as long and straight as possible (not wavy) which should be flossy, like silk, not woolly. It should extend from the back of the head to the root of the tail. Color, a bright steel blue, and on no account intermingled with fawn, light or dark hairs.

Legs.—Quite straight, of a bright golden tan color and well covered with hair a few shades lighter at the ends than at the roots.

Feet.—As round as possible; toenails black.

Weight.—Divided into two classes, viz., under 5lbs. and over 5lbs., but not to exceed 12lbs.

Value of Points in Judging.—Quantity and color of hair on back, 25; quality of coat, 15; tan 15; head, 10; eyes, 5; mouth, 5; ears, 5; legs and feet, 5; body and general appearance, 10; tail, 5; total 100.

On my resignation as secretary, Mr. H. W. Alderson (of Leeds) was elected, and the club is to be congratulated upon having made such an excellent choice. As far back as I can remember, Mr. Alderson was always strong in the fancy, and I believe was almost at the top of the tree in Yorkshires twenty years ago; although of late years his name has not appeared among the list of exhibitors, he is, I know, as much interested in the Yorkshire terrier as ever he was. Mr. Alderson had a famous dog about thirteen years ago, called Mozart. This celebrated Yorkshire terrier won 164 prizes, viz., 142 firsts, 17 seconds and 5 thirds, including no less than 36 silver cups, etc., the other celebrities about the same time being Reckless und Sandy, owned by Mr. Alderson; Mr. P. Eden's Albert, Hoyle's Tasso and Delhi, Taylor's Willie, Burgess's Kitty, Spink's Doctor; Alice, Bright, Emperor, Dundreary, Bruce, King, King William, Morning Star, Prince, etc.

I trust I may be excused in passing a few criticisms of the above standard of points, as I know they were drawn up after much careful thought by the members of the club. Of course, it is one thing putting on paper what ought to be, and quite another thing to produce the exact ideal. I know of no breed so likely to vary in points as the Yorkshire terrier. But if judges will try to select the dogs nearest to the above standard, then the objects of the club will be accomplished. Personally, I confess a weakness for color over quantity of coat, as I contend it is quite possible to produce a vast quantity of coat on a specimen otherwise indifferent. From boyhood, I remember my father (now deceased) being a great breeder and fancier of Yorkshire terriers, and he could not tolerate a dog without the rich golden tan, and I certainly inherit his weakness, and think the points most difficult to obtain should be thought most highly of when they are produced. I am rather afraid that of late years too much thought has been given to length of coat in preference to good color and moderate coat combined. "A lot of hair, with a dog attached," does not constitute a perfect Yorkshire terrier. Another point, also, that I would like to mention is the weight. It will be observed the club standard says—Weight, divided into two classes, viz., under 5lbs. and over 5lbs., but not to exceed 12lbs. Well, now, unfortunately, the managements of the various shows in the past have not divided the classes, and I regret to say, have not, in most cases, made a class at all for this breed, but put them in as "Toys, any variety." This, of course, prevents a good big dog being shown except in a variety class. What I am anxious to impress on the minds of the fancy is that where all sizes are shown together, "a good little one should always beat a good big one." No amount of argument would persuade me otherwise. From a life-long experience I know that good little dogs are much more difficult to breed than big ones, and when produced ought certainly to have the preference, like a diamond among precious stones, simply from its scarcity. I have often been amused at some of our leading shows to see a judge go to a dog about 7lbs. or 8lbs. weight, and take the hair on each side to notice its length, and then walk up to another in the same class about 3lbs. or 4lbs. weight, and go through the same performance, shake his head and think how much longer the big dog's coat was, seemingly never taking into consideration the proportionate difference in size, etc. Probably the small dog's coat would reach nearer the ground than the bigger dog's would. I contend that a dog at 4lbs. weight, with 9in. of hair on each side of his body, is much longer proportionately than 12in. on each side of a dog weighing 8lbs.

And all must admit that it requires much more care to rear a very small dog, especially one that is straight in limb and body; hence my contention. I have often been asked how these wonderful long coats were produced, and to make this article as complete as possible, I will give as full an explanation as I am able to of the method I adopt. As I stated at the outset, the pups, when born, are quite black, with tan markings and smooth coats like the black and tan terrier. Beyond taking care of them and keeping their beds dry and warm, very little notice is taken of them till about three or four months old, when the hair has got rough and begins to show signs of altering color on the skull and down the center of the back. Then begins a long and tedious preparation of daily brushing to cultivate a parting in the coat. I then slightly grease them all over with the following, which I have always used: Six ounces of neat's foot oil, six drachms of tincture of cantharides, six drops of oil of rosemary; put into a bottle and always shake well before applying. This is certain to cause the hair to grow. One of the main causes why we always keep them greased is to keep the coat straight and free from clots or matting together. They are usually washed once a week, and greased again the same day. I also keep each foot tied up in a small stocking or bag to prevent them scratching or catching their claws in the coat and dragging it out. It is really wonderful the great change and improvement that can be seen each week. When washing I use a bit of good plain soap. Dog soaps as advertised are too strong for their delicate skins. After washing they should be well dried with a soft towel and placed on a stool in front of a good warm fire, and afterward carefully combed and brushed. I say carefully combed because it is easy to pull off more hair at one time than can be grown again in many weeks, and they should always be combed and brushed till every hair is thoroughly free; if any small clots are left in it will only be so much worse to get out next time. This weekly process must be continued through life if one desires to have the dog's coat perfect. Some dogs grow much more coat than others, however, and all the care and attention in the world won't make some dogs ever carry but a moderate amount, and no matter how well bred, there will always be "good, bad, and indifferent," and more by far of the last.

Now a few words as to diet. It is not advisable to give these beautiful little creatures much meat if they will eat anything else. Personally, however, I give my Toys a little meat every day. I usually cut up very fine a small quantity of good beef and mutton from our own table, and mix it with a little potato, gravy, and soaked or crumbled bread, and I never feed my dogs more than once a day, and even then never allow them to have too much. Better far give them two meals with half the quantity than let them overfeed themselves. They are usually kept in a small cage, with a wire front, and never allowed to lie about in front of a fire. They require as much exercise as possible in some quiet place; the dangers of the public street are too great to risk, and they must not be taken into the open air at all if cold and wet. They do not require much in the way of drink, but the best thing for them is a little milk-and-water or sweetened tea-and-milk. In the case of dogs with a lot of hair on the head it is advisable to comb it from the face and tie it back, otherwise it becomes very dirty and uncomfortable by falling into their food, etc., which will rot the hair.

If care and attention be paid to their diet they require very seldom any medicine; it is far better to study their habits and requirements in food than to constantly keep physicking them—their little frames cannot stand it. But when really required nothing is safer or better than a teaspoonful of good castor oil. If it should do them no good it cannot harm them. One of the greatest possible dreads is distemper. This fearful disease has swept some thousands of promising youngsters away. It usually (as in other breeds) attacks them between three and six months old. I have found the best remedy to be, on noticing a puppy look the least bit unwell, to at once give it a very small portion of Rackham's Distemper Balls. It usually causes them to vomit, and brings up a quantity of clotted phlegm away from the stomach. If this matter is attended to at once I have generally found the puppy to progress favorably. But should distemper once fairly settle on to a puppy of this breed the chances are very much against its life being spared, and if the distemper be accompanied with fits it may be looked upon as a very hopeless case. There is so little of them to start with that a very few days (and sometimes hours) are quite sufficient to finish them off. For those that do linger on, however, nothing will surpass warmth and care. Much patience is required in bad lingering cases, as they invariably refuse their food and have to be fed from a teaspoon. It is a great mistake in these cases to give them beef tea or anything of a greasy nature, as it causes violent purging. A little arrowroot and milk is about the best. In cases of violent purging, the very best remedy I have ever found is mutton suet, scraped up very fine and put into a little milk and allowed to simmer gently until the suet has melted away; it is remarkably nourishing and soothing. Another almost infallible remedy for purging for a puppy that will eat is a little beef bone (from roasted beef), crushed up very fine.

I have dwelt somewhat on purging because it is a very common and often a very fatal ailment in these small pets. Still, I don't wish my readers to get the idea that they are a delicate dog when reared. Once over the distemper (many never have it), they are as hearty and sound as possible, and often live to a great age. I have only quite recently lost a little bitch, about 4lbs. weight, who was over fifteen years of age, and she never had distemper or a day's serious illness. She must have run some hundreds of miles after my father prior to his death. In drawing this somewhat lengthy article to a close, I would have liked, were it possible, to have mentioned some of the best dogs of recent years—but their names are so familiar that it seems a waste of time. It is also impossible to enumerate all the breeders known to me during my career. As their names are legion, and I might easily omit the names of some that deserve to be placed in the first rank as breeders, I would rather, in conclusion, say that, if I have omitted any feature that any of my readers would have liked to have seen mentioned, it may be taken for granted that it is an oversight; and at their request I would gladly give them all the information in my power. I trust the day will soon come when suitable classes will be provided for this breed at all our shows, and that gentlemen may be appointed to judge them who "understand them"—and then only may we hope to see at our leading shows good classes of the most beautiful of all dogs, the Yorkshire Toy Terrier.—*G. H. Wilkinson in the Stock-Keeper.*

PHILADELPHIA DOG SHOW.—Philadelphia, Feb. 9.—*Editor Forest and Stream:* The Philadelphia Kennel Club will hold a dog show April 19, 20, 21 and 22.—E. COMFORT, President.

HARE DOGS.

Editor Forest and Stream:

In northern New England we often hear this question from sportsmen: "Why is it we cannot get reliable rabbit hounds?" It is a fact that our best rabbit, or properly speaking, hare hounds will, at times, and often, too, lose one of these "racers" in the most aggravating manner. After diligent observation and inquiry, I have yet to learn of a single dog that was even approximately infallible in the pursuit of these timid denizens of our fur thickets. We have a goodly number of hounds hereabouts that will follow a fox for several days over as rough fox country as there is in the United States, with the ideal fox-hound sagacity and perseverance; but not a hare dog that will not lose from one to half a dozen hares every time he is taken out. Gentlemen in my own town have gone to great trouble and expense in procuring dogs for this fascinating sport; but as a rule they prove to be useless. There are reasons for this difficulty, I think. Firstly, our hares give out very little scent anyway. Secondly, they are generally hunted after a snow storm, which in these latitudes are by no means always damp storms. Thirdly, the hares take long jumps in running. Fourthly, the dog's barking jumps other hares, which will often cross, or follow along in for a distance the runway of the hare first jumped. Finally a small dog will sink in nearly out of sight in the deep, dry snow, of which we have so much on our mountains, and a large dog in a light fall of snow will run altogether too fast. Unfortunately, we cannot always have such a depth of snow as will be adapted to each kind of dog. I am convinced that dogs which will do well on the kind found south of us are almost useless on Southern hares. Beagles we find too small and large hounds too fast.

Is there no remedy then? I think there is. By crossing beagles with hounds of the Virginia foxhound blood, for instance, both sire and dam being trained on hares and nothing else, and with an occasional new infusion of blood of the same character, obtain, in due course of time, the much desired result—a dog of good nose, cunning and grit, with the strength to make his way through deep snow, and not too fast. I am a firm believer in the laws of heredity, and I opine that characteristics of mind and body may be cultivated and improved in dogs by painstaking breeding, as surely as one or the other or both have been in the cases of hogs, cattle and horses.

Many of the patrons of your journal must have hare dogs, let us hear from them as to how their dogs were bred and broken, and, although numbers of them may not support me in my statement as to the present inefficiency of the hare dog they may enlighten these who have made observations similar to DALG.

THE DOGS OF ANTIQUITY.

CANINE historical times take us as far back as the ancient Egyptians, whose regard for those intelligent animals was so great as to lead them to exalt them to the rank of deities. However preposterous this fact may now appear to some of us, it may strike one that the bewigged inhabitants of the Nile Valley were not so dark in mind as in body, for, grateful for the important sanitary services rendered by the scavenger dogs that abounded in their great cities, they showed their appreciation by paying them homage after their fashion. Then let us not glance with such a consciousness of enlightment at the puppy mummies that stare so inanely from the glass cases of the British Museum, for some day future *rejctoris* of the "coming race" may look with a grim smile upon the tombstone of Darwin.

Laying aside some mongrel forms, two distinct species only are depicted on the ancient Egyptian monuments, one a tall, strong-limbed greyhound, either spotted black and white, or of a dun color; the other a terrier-looking little beast, very similar to the oft-recurring jackal, but different in a characteristic tail.

The Assyrians of old were keen sportsmen and rivalled, or, perhaps, eclipsed, the boasted record of some of our mighty Nimrods, for they fearlessly hunted the lion and tiger in an age when repeating rifles and breechloading shotguns were yet buried ages deep in the future.

In the royal battues the game was brought down with no other weapons than bow and arrow and the deadly javelin; but the huntsmen were accompanied in the chase by huge, fierce dogs, resembling the gigantic Thibetan mastiff, on whose courage they greatly depended for their safety. Relays of the somewhat gaunt-looking steeds of the country and period must have been necessary to enable the Ninevehan grandees to follow the strong-muscled hounds after their favorite prey, the swift-footed wild ass, and rich must have been the sport as they careened in full cry through plain and over rocky hillsides. Probably to a similar breed belonged the dog sent as a present to Alexander the Great by the King of Albania, which Pliny mentions in his "Natural History." This dog, when turned loose before bears, wild boars and stags, refused to attack them. This conduct so disgusted the monarch that he ordered the animal to be destroyed, but the King of Albania hearing of this, sent him another, with the recommendation to put before the noble animal antagonists worthy of its strength and courage. Thereupon Alexander had a lion provided, and the dog was liberated. In twenty seconds the back of the lion was broken. An elephant was next selected for an encounter with this Molossus, with equally fatal results; the mastodon, bewildered by incessant and lightning-like attacks on all sides, gradually became giddy and finally came down with a crash, the ground shaking with the fall, to the intense and demonstrative delight of the great conqueror.

In ancient times dogs apparently "took the shilling," as we have an account of a king of Garamantes being brought back from exile by 200 dogs "which he maintained to combat against all his opponents."

Pliny also tells us that "the people of Colonophon and Costaboh kept troops of dogs for the purpose of war, and these used to fight in the front rank and were never known to retreat; they were faithful auxiliaries," and what was quite an item required no pay except food and lodging. History does not inform us whether the regimental cook ever worked up surplus or decrepid dogs into bolognas—sometimes silence speaks more eloquently than words.

Wolf dogs and greyhounds, with a smaller spaniel-like breed, are the dogs oftener recorded by Greek art. The two former seem to have been chiefly used by the chase, and the latter appears as a favorite with the gentler sex, depicted on the decorated vases of the time. In the scene illustrating the recognition between Ulysses and his faithful dog Argus, we find "the dog is of the large sporting kind with long head, square muzzle and curved tail."

Homer mentions table dogs; these in paintings and sculptures of banquet scenes are shown picking up crumbs, a privilege they sometimes shared with favorite roosters, the silver spurred "royal games." But we are sorry to say our faithful friend and servitors have not been equally well treated in all countries. In Sygaros, an island lying off the promontory of Ras-el-Had, they were sedulously expelled from the interior and left to wander and die on the seashore, a most extraordinary proceeding which is wholly unexplained. Cruelty of some character appears occasionally pleasant to mankind, and such exhibitions as those afforded by the Roman circus have their modified representations in the tournaments and jousts of the middle ages, as well as in the bull fights of the present day.

Sculptured specimens of Molossian dogs may be seen at the entrance of the *Sala degli Animali*, in the Vatican. In the Græco-Roman saloon of the British Museum there is a statuette representing the metamorphosis of Acteon; the indiscreet huntsman being attacked by his hounds, which are of the wolf-dog variety. In the lower room there is also a capital marble group of two greyhounds at play, from the Monte Cognolo, near Rome.

It is noticeable that none of the old greyhounds have the thinness of limbs of our modern ones, and the puppy trails of those in the latter specimen are very evident. Ancient writings give us so many testimonials of the dog's fidelity and intelligence that it would require a volume of no mean size to hold them. FRANK HEYWOOD.

COON DOGS.—*Editor Forest and Stream:* In reply to "W. C." in yours of Jan. 27, I would say that when I was young coon hunting was my steady diet. When a collegian, Bose and Tiger absorbed much more of my attention than Cæsar's Commentaries or Davies's mathematics. The result of my observation was that a cross between a hound and a "yaller" dog was the best coon dog. If the "yaller" was a collie, it did first rate; a snapping dog is the thing to handle a coon singly, and if a wildcat is stirred up by mistake, nothing but a "snap and let go" dog has any business there. A hold-fast like a bulldog would be disembowelled in short order. Nowadays that we have got past "yaller" dogs, I would suggest the cross of a hound on a Bedlington or other large terrier. If the Airedales are thoroughly good vermin dogs, I should think they would be the thing, adding weight, power and "varmint" capacity to the cross. An old hound who has lost the edge off of his speed often makes a good coon dog, but my observation was that the hound lacked the vermin-killing taste that is wanted in a coon dog. What glorious fun coon hunting is. Fox hunting is well enough in its way, but if in a deer district some of you "sportsmen" are sure to kill a hound if the unfortunate gets on the trail of a deer, and if there ever was a hound that wouldn't run a deer trail or chivy a goat, I wouldn't have him, for he wouldn't be able to scent his dinner if ten yards away. Then, there is no knowing where a fox chase may lead you to, and the most ardent hunter has legs that will get tired climbing over hills and rocks. A coon chase is so easily gotten up, has such a free and easy way about it, no wrangling about "There, Flute is ahead," followed by "You're a liar, it's Lead," a lot of wrangling about something they know nothing of, and in the nature of things can't know anything of. Then the fun of climbing a tree after a coon, to find that the dog has "lied," is immense, not in the eyes of the climber, but in those who witness it, and who are not the owners of the dog that "lied." Then again, the murderous instinct of mankind is gratified in a coon chase, for the rule is that you "kill something," while if you do it in a fox hunt the chances are you don't see it.—H. S.

MR. H. WYNDHAM CARTER.—At Maidstone, on Saturday, before Mr. Justice Denman, Harry Wyndham Carter, described in the calendar as a journalist, was charged with feloniously wounding Frederick Willson, with intent to maim. Mr. Kemp, Q. C., and Mr. Grain appeared for the prosecution; and Mr. Cock, Q. C., and Mr. Gill defended. Two bailiffs were trying to enter the house of the prisoner under a bill of sale. The prisoner came to the window, which was a projecting one, warned the bailiffs three times, and then fired down upon one of them with a revolver but missed him, as he took shelter underneath the window. The other then called out that Carter was a coward to shoot at the head. On this Carter fired at the second man. The revolver was loaded with cartridges filled with No. 8 shot, which Carter had had made for the purpose. The bailiff was shot in the face and head, and one of the shots entering the eye, caused loss of sight. It appeared that Carter, in consequence of threats uttered against a collector of income-tax, had been bound over to keep the peace on a former occasion. In the result he was found guilty of unlawful wounding. The judge, in giving sentence, said it was a very bad case, and inflicted on him the maximum penalty of five years' penal servitude.—*The (London) Times.*

LARGE MASTIFF PUPPIES.—Fair Haven, Vt., Feb. 1.—*Editor Forest and Stream:* In reply to Mr. Heldeman's communication of Jan. 27, claiming the largest mastiff bitch of which there is any record, I agree with him that his is a very large one, but not equaled by several I could give, sired by Mr. Winchell's Boss, at 7mos. old. I gave the weight of my Boss's Zulu, 132lbs.; Boss's Major, 124½lbs.; Boss's Joe, 118lbs. The two bitches of this litter were sick with the distemper nearly one month previous, and weighed only a trifle more than they did at 6mos. Boss's Meg weighed 113½lbs., Boss's Venus, the titman of the litter, weighed 109lbs. Mr. Winchell's Boss's Minnie (A.K.R. 3374) at 7mos. weighed 119½lbs., now at 13mos. weighs 153lbs. I doubt if the weight of any one all in one litter was ever equaled before. Also, I question if there ever was a mastiff stud dog that shows such a record.—CHAS. R. ALLEN.

BESSIE'S PEDIGREE.—Haverhill, Mass., Feb. 6.—*Editor Forest and Stream:* In your issue of Jan. 20 Mr. W. B. Wells of Chatham, Ont., states that Bessie's pedigree is false. If it be true why did not Mr. Wells or Mr. Brown dispute it in 1885, when she was advertised for sale in FOREST AND STREAM by Mr. Harrington; also when she was exhibited at Boston in the same year by A. R. Fowler, Newburyport, Mass. When I purchased Bessie from G. H. Lang, Haverhill, Mass., he gave me the following pedigree of Bessie: black and white ticked. Bred by A. W. Harrington, Ruthven, Ont., whelped April, 1884, owned by J. B. Bolton, Newburyport, Mass. She is by Mingo out of Fausta II. If this pedigree is genuine, as they claim it to be, let them come out and show their colors.—I. TENNEY.

THE PROVIDENCE DOG SHOW.—The first show of the Rhode Island Kennel Club will be held at Providence, R. I., March 29 to April 1. The premiums offered are silver medals in the champion classes, and $10 and $5, in all of the prominent classes, with $8 and $4 in the others, and diplomas in the puppy classes. The Secretary writes that $250 in cash is already offered in special prizes and that enough more is expected to give each of the classes a handsome sum. We have no doubt that the entry list will be a large one. As this will be the initial exhibition of the Providence Club it is greatly to be hoped that the organizers may meet such success as will encourage them to give other shows in the future.

THE NATIONAL FIELD TRIALS CLUB.—*Editor Forest and Stream:* Notice is hereby given that there will be a meeting of the Executive Committee of the National Field Trials Club at the Burnet House, Cincinnati, Ohio, at 10 A. M. on Monday, February 21, for the purpose of investigating the charges preferred in the matter of the handling of Ben Hill in the Ben Hill-Lillian heat at the recent trials, and for the consideration of such other business as may properly be brought before the committee. Members of the club and all interested are invited to attend. By order of the Executive Committee.—W. B. SHATTUC, President.

SPANIEL SWEEPSTAKES.—The American Spaniel Club offer a sweepstake for field spaniels whelped in 1886, also a sweepstake for cocker spaniels.—A. C. WILMERDING, Secretary, 17 Murray street, New York.

THE BOSTON DOG SHOW.—The New England Kennel Club are making every effort to have their coming show the best that has ever been held in Boston. The premiums offered are very liberal, $20, $10 and a medal in nearly all the classes, besides a large number of special prizes, many of them being in cash. The club have taken the lead in allowing puppies to be withdrawn the second day of the show. This is a very sensible arrangement that we are sure will be pleasing to exhibitors, and the example will doubtless be followed by other clubs.

KENNEL NOTES.

Notes must be sent on prepared blanks, which are furnished free on receipt of stamped and addressed envelope. Sets of 200 of any one form, bound for retaining duplicates, are sent for 30 cents.

NAMES CLAIMED.

☞ **Notes must be sent on the Prepared Blanks.**

Boyd Noble. By Dr. R. I. Hampton, Athens, Ga., for black and white English setter dog, whelped Aug. 17, 1886, by Count Noble out of Belle Boyd (A.K.R. 1277).

Alf Boyd. By Dr. R. I. Hampton, Athens, Ga., for blue belton and tan English setter dog, whelped Aug. 17, 1886, by Count Noble out of Belle Boyd (A.K.R. 1277).

Zoraya. By Dr. R. I. Hampton, Athens, Ga., for white, black and tan English setter bitch, whelped Aug. 17, 1886, by Count Noble out of Belle Boyd (A.K.R. 1277).

Clifford's Bow. By Geo. E. Wilson, Van Wert, Ohio, for liver and white pointer dog, whelped July 18, 1886, by King Bow out of Sue.

Queen. By Hiram Card, Elora, Ontario, for black Newfoundland bitch, whelped Nov. 25, 1886, by Sancho out of Juno II. (Carlo—Juno).

Tagliont. By Chas. E. Taylor, Bath, Me., for liver-ticked pointer bitch, whelped August, 1886, by Bob (Bang—Princess Kate) out of Mollie (Don Carlos—Regalia).

Black Aggie. By Harry D. Brown, Waterbury, Vt., for black cocker spaniel bitch, whelped Oct. 24, 1886, by Black Pete (A.K.R. 3071) out of Althea (A.K.R. 842).

Madam. By John H. Sutcliffe, Louisville, Ky., for tawny and white St. Bernard bitch, whelped Sept. 18, 1886, by Merchant Prince (Bayard—Pastime) out of Nun (Monk II.—Abbess II.).

Maxie. By R. L. Houston, Birmingham, Ala., for black, white and tan English setter bitch, whelped Jan. 29, 1886, by his Bob H. out of Minnie Belle.

DEATHS.

Heather. Brindle Scotch terrier bitch, whelped March, 1882 (Kilsey—Gyp), owned by J. H. Naylor, Chicago, Ill., Jan. 29.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

S. B., Pawtucket.—Keep the bowels free and in good condition with syrup of buckthorn in teaspoonful doses. Give five drops Fowler's solution of arsenic morning and evening in the food.

J. S. W., Waterbury, Vt.—Your dog has canker of the ears. Get the following: Of bromo-chloral one dram, of laudanum one dram, of water six drams. Mix. Drop in the ears morning and evening a few drops only, after cleansing and drying.

C. E., Charlestown. Two cocker pups, 5 mos. old, have been sick for two weeks. Symptoms: running water at nose and eyes; eyes gum up if not washed daily; slight cough and inclined to choke at times. Treated for distemper at first, but think it is worms now as I have found some. They eat well and appear smart. Sneeze and snuffle all the time. Ans. We think your pups have had both distemper and worms. Purge with castor oil and then give thirty grains of areca nut powdered and made into a large pill to each dog. Feed only on milk for a week. Give three grains of quinine three times daily in pill form hidden in a morsel of meat. If they have fever give two drops of tincture of aconite every hour.

Rifle and Trap Shooting.

RANGE AND GALLERY.

REST SHOOTING.

Editor Forest and Stream:

Living in a locality where there are no rifle ranges nor shooting clubs and very few rifle shooters, I am forced, when the shooting fever comes on, which it has periodically for the last thirty years, to shoot it out alone.

This winter I have given my greatest attention to the shooting of .22-calibers at rest, and as some of the work was beyond my own expectations, I believe the result of my experimenting will be of interest to a portion of your readers. While I have barrels for both long and short cartridges, my practice has been mostly with a 24in. .22 Maynard, using the short 3-grain Winchester rim-fire cartridge. My shooting has been with globe sights at a plain white target, 2½ to 3in. square, for 25yds., and 4 to 5in. square for 50yds.

The shooting was done from a little 8x12 building, well warmed and comfortable, from which I could laugh at snow and rain.

In all cases the center of the target was the center shot at and measured from.

In 50 consecutive shots at 50yds., the only shots fired from the gun that day, the total measurement was 25 14-16in., and not a shot outside a 2in. ring.

In 100 consecutive shots at 25yds., the total measurement was 22½in., an average of 2¼in. in each string of 10 shots, hitting a ½in. bullseye 8 times in 10.

Inclosed are exact copies of 3 targets of 5, 10 and 30 consecutive shots in each, all at 75ft. In the first the 5 shots are entirely inside a ½in. ring; in the second the centers of the 10 shots are inside, and in the third all the 30 shots hit a ½in. spot.

In the vast amount of shooting that has been done with .22-calibers in galleries and elsewhere, there may have been many targets made better than these; but to make them requires not only a good shooter, a good gun, good ammunition, great care and pains, but a certain amount of good luck with all the rest.

SOUTH HAVEN, Mich. H. M. AVERY.

BOSTON, Feb. 5.—The light proved trying to the eyes of the riflemen at Walnut Hill to-day, but the other important condition, wind, proved to be excellent, and the large number of riflemen present enjoyed themselves immensely.

Decimal Off-Hand Match.

SALEM, Feb. 5.—The Salem Rifle Club, at their range to-day, had a small attendance, but the scores were good, as the figures show:

Practice Match—Standard Target, 200yds. Off-hand.

G A Wilson	6	6	6	6	9	10	6	10	10	8—77
B Wilkins	4	5	8	7	5	4	7	5	7	5—57
W B Elverton	6	10	4	5	4	3	6	8	4	5—55

State Militia Match—Creedmoor target, off-hand: G. A. Wilson, 44444—20, which fills his score for a bronze medal.

G A Wilson	44544—21	44445—21	44544—21	44454—21	54555—24
W Bacheller		45344—18	43345—19	34544—20	45444—21

The association will hold a shoot Feb. 22 for prizes.

WILLIAMSPORT, Pa., Feb. 1.—In the first Bullard prize rifle contest, two teams from this city entered to shoot, the Williamsport Rifle Club, organized September 1886, and the old and reliable team of Company D, Twelfth Regiment N. G. Pa. Company D's total score, adding handicap, was 594; and the score of the Williamsport Rifle Club 591. After the scores were received through your valuable paper, a series of three matches was arranged between the two clubs, distance 200yds., using the Massachusetts' Combination Ringed Target. The team losing two matches out of the three to furnish an oyster supper for both teams. The first match, January 24, was as follows. Very windy day and score much lower than the second match:

Company D, Twelfth Regiment N. G. P., Geo. Gilmore, Captain:

Fullmer	7	5	9	8	10	9	9	9	10	7—83
Spotts	12	4	12	4	8	8	6	0	5	7—66
Fry	6	6	7	6	5	0	5	4	6	10—55
Winder	8	9	7	0	7	10	7	7	12	3—70
Galbraith	5	9	4	6	4	7	9	11	7	12—74
Cummings	0	5	11	7	8	5	6	10	11	6—72
Cook	4	0	3	5	9	7	7	4	9	3—51
Stair	0	3	3	7	4	3	8	8	3	8—48
Jamison	10	7	9	5	5	0	6	10	4	3—59
Bennett	6	11	9	9	9	10	5	4	9	9—77—655
Adding handicap										50
Total										705

Williamsport Rifle Club, N. A. Hughes, Captain:

Hughes	5	8	8	10	11	6	9	9	6	11—86
Piatt	10	12	7	11	7	5	0	6	7	8—73
Kelley	12	9	9	9	9	9	5	11	6	10—89
Millspaugh	10	4	9	5	8	11	7	9	8	7—78
Johnson	0	9	4	9	11	5	7	7	11	5—68
Crum	11	6	0	9	7	7	8	6	6	3—56
Harder	8	5	10	5	8	0	4	6	10	6—62
Whitehead	0	5	6	5	11	6	10	9	8	8—68
Heller	10	8	8	0	9	3	8	8	12	3—69
Rothrock	6	6	0	4	0	9	0	9	5	3—42—691

Second Match, Jan. 31—Company D, Twelfth Regiment, N. G. P., Geo. Gilmore, Captain:

Fulmer	9	12	10	9	9	12	12	11	9	7—100
Spotts	7	9	5	5	8	6	0	0	9	11— 60
Fry	7	7	6	10	9	11	8	11	6	7— 82
Winder	6	10	9	5	11	10	7	4	4	8— 74
Galbraith	7	10	8	10	10	11	10	5	8	8— 87
Cummings	3	9	0	5	5	7	7	9	8	8— 63
Cook	7	10	10	12	6	9	10	9	8	10— 91
Stair	0	7	5	11	7	10	6	6	6	7— 65
Jamison	10	9	5	10	8	0	4	9	6	8— 69
Bennett	8	8	9	8	11	10	5	6	8	4— 77—768
With handicap										50 — 818

Williamsport Rifle Club, N. A. Hughes, Captain:

Harder	5	11	11	9	11	9	6	10	8	6— 86
Hughes	8	8	11	8	10	8	6	9	6	9— 83
Heller	9	7	10	7	11	8	6	9	6	9— 80
Piatt	11	4	6	9	9	10	0	7	5	9— 78
Crum	8	9	7	12	10	6	12	9	8	6— 85
Rothrock	5	5	8	6	6	6	8	8	6	6— 64
Millspaugh	10	10	6	9	5	7	9	8	9	10— 67
Kelley	9	9	11	10	7	8	11	6	9	12—92
Johnson	6	5	12	12	10	11	6	7	8	12—89
Whitehead	7	9	10	5	8	0	9	12	12	9—90—814

First match Company D won by 14; second match by 4, total 18. The Rifle Club will furnish the oyster supper next Monday. The two matches were close ones, and considering that the club was only organized four months ago, and that the first time they ever shot at 200yds. was on Dec. 18, the shooting was good; and in the near future you can look for better scores.—WILLIAMSPORT.

Give distance and target when you send scores.

LAWRENCE, Mass., Feb. 6.—The following scores were made at the regular weekly shoot of the Lawrence Rifle Club on Saturday, Feb. 5., Bullard Team Match (No. 2):

E. F. Richardson	9	9	10	10	9	8	10	8	9	10—92

SCHUYLER.—Mr. Jacob Rutsen Schuyler, who was the senior member of the firm of Schuyler, Hartley & Graham, died at his home, at Bergen Point, Feb. 4. He was stricken with paralysis several months ago and never recovered. Two weeks ago he fell, injuring his head, and the shock caused his death. The deceased, who was 70 years old, amassed a fortune during the war by furnishing military equipments. When the city of Bayonne was incorporated in 1869 he was selected as one of the Town Council and was first president of the Board of Council. He resigned two years later. The deceased was a lineal descendant of Phillip Picterus Van Schuler, who left Amsterdam, Holland, in 1650, and settled at Fort Orange. His mother was a member of the Van Rensselaer family. Mr. Schuyler married a Miss Sarah Edwards, a descendant of Jonathan Edwards. She died about ten years ago. He leaves two sons and four daughters, all of whom except two are married.

NEWARK, Feb. 2.—The return match between Mr. Dorrler, of the Zettler Club of New York, and Mr. Godfrey Snellen, of the Essex Club of this city, was shot in the Essex range to-night, in the presence of a large number of riflemen from both cities. Mr. Dorrler took the lead at the start, and won by the most remarkable shooting. In fifteen strings of ten shots each, with 120 possible he made 1,752. His lowest string was 113, and he made 119 twice, 118 four times and 117 five times. Snellen's lowest string was 106, his highest 118 and his total 1,716. Dorrler's average was 116 4-5 and Snellen's 113⅗. The prize was worth $50. J. Coppersmith, of the Essex team, has made a match of 100 shots for $50 with Mr. Walter, of New York.

WILMINGTON, Del., Feb. 3.—The Wilmington Rifle Club is now equipped for indoor as well as field shooting. Having arranged for gallery shooting some of the members assembled at their headquarters this evening for a match at short range. I inclose a plan of the target we are using for gallery practice. It is a modified Hinman target, reduced in proportion from 200yds. for 12½. it was necessary to drop the 5 and 7 circles as well as the divisions of the bullseye, because so great a reduction brought the rings too close together for practical purposes, but the bullseye and remaining rings are in exact proportion to the 200yds. target. We count a bullseye as 9, because that is the average value of the Hinman bullseye. Our target is a steel plate with a ½in. hole for bullseye, leading to the gong hammer back of the target, and the circles are traced on the face. The members are well pleased with the target, as a score made on it will correspond very closely with one made in the field on the larger target, as the reduction of the "possible" compensates for the absence of the rings. I inclose score made this evening, but it is not up to average as our light was not good:

H B Seeds	6399692693—62	W O'Connor	2199231444—42

TORONTO, Jan. 29.—The Scarboro Rifle Association held its annual meeting at Mr. J. W. Kennedy's, Agincourt, this evening. The officers elected for this year are: Simpson Rennie, President; Geo. Chester, First Vice-President; R. Park, Second Vice-President; A. W. Granger, Secretary; J. W. Kennedy, Treasurer. These officers, together with Isaac Stobe, R. McCowan and S. Kennedy, form the Executive Committee. This association was started less than one year ago; it has now over fifty members, and after paying all expenses had a balance on hand of over $31 at the close of the year. The club is one of the best in the Province.... The Newmarket Gun Club has elected the following officers: President, T. Ratcliff; Vice-President, W. Brunton; Secretary-Treasurer, J. Gower. Match Committee: G. W. Wilkinson, T. T. Bailey, A. T. Doan and the officers....At a meeting of the East Toronto Gun Club in Leslieville, on Feb. 3, John McLatchie was elected President; Thomas Sawdon, Vice-President; W. Scarfe, Secretary; Samuel Greenwood, Treasurer. The President presented to W. Felstead a handsome silver cup suitably engraved, the gift of Capt. Cooper, Felstead having won it three times in succession.

THE TRAP.

Scores for publication should be made out on the printed blanks prepared by the Forest and Stream, and furnished gratis to club secretaries. Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

A NEW SCORE BOOK, entitled "Miss Annie Oakley's Climax Score Book," is published by the U. S. Cartridge Co. for gratuitous circulation. Miss Oakley is an Ohio girl, 20 years old, who has used firearms for ten years. A personal sketch in the Score Book says: "Ever since a toddling child she has had an inherent love for firearms and hunting, and at the age of ten she, as often as ammunition was obtainable, would smuggle her brother's musket and steal into the woods, where game at that time was plentiful. Naturally she was a good shot and came home well supplied with game. At the age of twelve she was presented with a 14-gauge muzzleloading shotgun. With this she improved rapidly and became such a fine shot that she rarely missed quail or pheasant; and at the age of fourteen she had paid off a mortgage on her father's homestead with money earned from the sale of game and skins, shot and trapped by herself alone. Then came a local reputation, and with improved firearms she attracted wider notice. For the past five years she has been shooting before the public with great success. The first two years before the public she devoted to rifle and pistol shooting, and there is very little in that line she has not accomplished. At Tiffin, O., she once shot a tencent piece held between the thumb and forefinger of an attendant at a distance of 30ft. In April, 1884, she attempted to beat the best record made at balls thrown in the air, using a .22-cal. rifle. The best record was 979, made by Dr. Ruth. Miss Oakley used a Stevens .22-cal. rifle and broke 943. Her first attempt at clay-pigeon and trap-shooting was made about three years ago in Cincinnati, shooting with such fine shots as Bandle, McMurchy and other noted shots.

"In February, 1885, she attempted the feat of shooting at 5,000 balls in one day, loading the guns herself. In this feat she used three 10-gauge hammer guns. The balls were thrown straight away from three traps, 15yds. rise. Out of the 5,000 shot at she broke 4,772. On the second thousand she only missed 16, making the best 1,000 ball record—984. This feat was accomplished near Cincinnati, O., in less than nine hours.

"Besides the thousands of exhibitions she has given, she has shot in 21 matches and tournaments, winning 25 prizes. Her collection of medals and firearms, all of which have been won or presented to her, is considered the best in America.

"She has hunted in many of the game sections of America and Canada, and says, with a pardonable pride, that she has shot quail in Virginia, ducks in Illinois, prairie chickens in Kansas and deer in northern Michigan. Her style and position at the trap is considered perfection by such critics as Budd, Stice, Erb, Bogardus, Cody, Carver and the English champions, Graham and Price. Shooting clay-pigeons she has a record of 96 out of 100. At live pigeons her best record is 23 out of 25, made in a match for $100. What makes Miss Oakley's feats more surprising is the fact that she is small in stature and weighs only 110lbs."

TORONTO, Jan. 29.—The second competition for the silver cup presented by the Canada Blackbird Company, of Niagara, Ont., which was first shot for in Mr. McDowall's tournament last December, took place at Eglinton to-day. Fourteen competitors entered the contest, among whom were some from Hamilton and Niagara. The day was bright and clear, and could not have been better suited for artificial bird shooting. About 100 spectators were present, and were treated to some fine shooting by Messrs. Stroud, of Hamilton, and Wayper, of Hespeler, who, having tied at 18 out of 20 at 18yds., went back 5yds. and tried again at 5; then tied again, breaking 3 out of 3 each. After this it was miss and out. Wayper missed his sixth bird, Stroud got his 6 straight, thus winning the cup by the splendid score of 31 out of 34. D. Blea was referee. Following is the score:

Eglinton, Jan. 29.—For the Canada Blackbird Co.'s challenge cup; 20 birds each at 18yds. rise.

J Wayper	13	J Sawdon	12
W Stroud	18	F Moffatt	12
Geo Griffith	15	A Elliott	11
Geo Smith	15	W McDowall	10
W Felstead	14	J McClure	10
W Smyth	13	T Loudon, retired.	
G Carruthers	12	J Quarrie, retired.	

Shoot off ties of 18:

At 21yds., 5 birds each.		At 24yds., 3 birds each.	
W Stroud	5	W Stroud	2
J Wayper	5	J Wayper	2

At 27yds., miss and go out.

W Stroud	6	J Wayper	5

A sweep at 10 birds was also shot, in which 11 entered. The winners were:

W Stroud	8	Geo Griffith	7
W McDowell	7	W Felstead	6

WELLINGTON, Mass., Feb. 5.—There was a good attendance at the Wellington Gun Club shoot to-day. In the badge match, Short won in Class A, Lamson in Class B, and Warren in Class C. Following were the winners in the several events: 1. Six clay-pigeons—Sanborn first, Wilson second, Shumway third. 2. Six blue rocks—Sanborn first, Wardwell second, Tucker and Lawson third. 3. Six clay-pigeons—Wilson first, Lawson and Wardwell second, Tucker third. 4. Six blue rocks—Sanborn first, Shumway and Lawson second, Ames third. 5. Six clay-pigeons—Wardwell first, Wilson and Tucker second, Ames third. 6. Six blue rocks—Wardwell first, Shumway second, Lawson and Wilson third. 7. Ten clay-pigeons—Stanton first, Short and Swift second, Lawson third, Warren fourth. 8. Six blue rocks—Swift, Wilson and Snow first, Stanton and Sanborn second, Wardwell and Warren third, Lawson fourth. 9. Three pairs clay-pigeons—Wardwell and Short first, Shumway, Wilson and Warren second, Stanton third, Ames

and Baxter fourth. 10. Six clay-pigeons—Ames first, McCoy and Swift second, Wilson third, Snow and Stickney fourth. 11. Six clay-pigeons, novelty match—Stanton first, Lawson and Swift second, Short third, Warren fourth. 12. Ten clay-pigeons—Swift first, Stanton second, Nye third. 13. Six clay-pigeons, straight-away—Swift and Stanton first, Sanborn second, Wardwell third. 14. Five clay-pigeons—Sanborn and Swift first, Nye second, Brown third. 15. Six clay-pigeons—Swift first, Sanborn second, Short and Stanton third.

NEWARK, Feb. 5.—The monthly shoot of the Nimrod Club came off on the Bloomfield avenue grounds this afternoon, and the prize, a dog's-head pin in gold, was won by Warren Goble, who broke 8 out of 10 clay birds. W. J. Beatty broke 7 out of 10. A sweepstakes was shot afterward. The club will buy a lot and build a house in a few months.

Canoeing.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signal, etc., of their clubs, and also notices in advance of meetings and races, and report of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

A SUMMER'S CRUISING.

AFTER a pleasant stay at Grindstone Island during a part of the meet of 1885, in the afternoon of Aug. 8 I left the camp with its many pleasant recollections, and in company with Messrs. Phil. Wackerhagen and Stanton, of the Mohicans, had a pleasant cruise among the islands. We stopped at Decker's Island for supper, but did not stay long, as the mosquitoes were too thick. When we landed at Alexandria Bay it was just getting dark and everything was illuminated. We foraged around for supplies and hauled our canoes upon a coal dock, where we camped for the night.

Aug. 9.—We had to get out early in the morning, as folks were rather astonished at the sight of the canoes set up on the dock, so we pulled out and camped on an island close by. We stayed "at home," and fixed up, as it rained most of the day.

Aug. 10.—It was still raining, but cleared up early in the day, so I bid my companions good-bye with a hope that we would soon meet again, and started down the St. Lawrence with Messrs. Stanton and Greenleaf, of New York. We had a fine easy cruise, as it was not the kind of weather for hard work, stopped for the night at Brockville, a lively place, and it being a civic holiday almost everybody seemed to be out and the river was full of all kinds of craft. We met Messrs. Baldwin and Richards at this place.

Aug. 11.—We left on good time, and the weather being fine, took it very easy; got out of the islands and at last reached Ogdensburg, a fine place, where we packed up and parted. I sent my canoe to Rouse's Point, stayed over night, and took the steamer next day to Montreal, making a short stay which was very interesting, but soon became tired of cruising on land, so went by rail to Rouse's Point.

Aug. 14.—I looked up my canoe and found it in a freight house with about a car load of freight piled on top. I naturally expected to find something smashed, but fortunately my canoe is built specially strong and was all right, but I gave the company a good blessing for carelessness. The canoe was soon packed and supplies in shape, as I was anxious to get on the water again, so started in the evening with quite a crowd to see me off. Some of the spectators had never seen a canoe and could not see how such a little thing could sail, so I had to answer plenty of questions. The weather was rather stormy, so I had to make camp early, but unluckily struck a bank of fain white clay. However, I managed finally to get settled.

Aug. 15.—The day turned out bright and clear, and for a wonder the wind was in my favor, as it generally seems to blow from the south during the season as stated by natives. I had to reef, but at last made Plattsburgh. The wind was strong around Cumberland Head, so I went rapidly. Stopping at Port Kent I had a look through Au Sable Chasm, which no one should miss going through, and then pushed on and struck a fine camp about five miles further on. I felt much better after a good warm supper.

Aug. 16.—The weather was still fine, bright and clear, and I cruised through beautiful scenery and a fine country, making camp in sight of Split Rock Light, one of the finest points on the lake.

Aug. 17.—This day was clear but windy, blowing the wrong way and making hard work paddling, ending in a regular gale. I am satisfied that a canoe properly made will stand almost anything under paddle with proper care. I stopped at Port Henry, got supplies, made camp near fort, and after a hearty supper turned in, as I had had a hard day's work. I stopped at Crown Point and Fort Ticonderoga, the trip through the lake was fine with its many points of historical interest.

Aug. 18.—The weather was bright and clear, and I managed to find my way up the creek to Ticonderoga and stowed canoe for the night.

Aug. 19.—I found old Jack Sardine and got him to transfer the canoe to Lake George, where I found more head winds and beautiful scenery. As I was getting ready for camp three jolly canoeists passed along. I hailed them and we all made camp together. The boys were roughing it, had home-made canvas canoes, one blanket and an old tent for shelter at night, and seemed to prefer the soft side of a rock for a bed, although cedar boughs were plenty. I made quite a contrast with a solid cedar canoe, Mohican tent, rubber bed, plenty of blankets and grub-box well filled. I gave the boys what information I could, for they had the canoeing spirit, and this season they will come out with five canoes and good outfit. We cruised through the rest of the lake together. During the day, while passing one of the cottages, I received an A. C. A. signal, which I answered and pulled for the shore, expecting to find some member, but instead found a very pleasant party. One of the ladies had been told of the signal and concluded to try it and found it correct.

Aug. 20.—This day was calm and pleasant; the boys got up a huckleberry dinner and we passed the night on the Canoe Island. The boys camped in Dr. Neide's cabin.

Aug. 21.—The weather was threatening, but I got to Caldwell safely. I hated to leave the lake with its beautiful scenery, but at last packed up and shipped my canoe to Albany. My acquaintances went as far as Fort Edward, where they took the canal and Hudson River home. I have heard since they were all spilled out in rapids before getting to Troy.

Aug. 22.—I reached Albany and hunted up Commodore Oliver, having hard work to find him as there was a strike at his establishment, and I was collared by strikers as they thought I was after a job. I managed to explain things and the men apologized for their mistake. Of course I received splendid treatment from the Mohicans which I will never forget.

Aug. 24. I shipped the canoe to Pittsburgh, and thought I would cruise on land a while, so visited at Saratoga, New York, and vicinity, and Boston. I also stopped at Philadelphia on the way to meet my canoe.

Sept. 1.—In Pittsburgh I could not find any canoeists at home, most of them were still cruising. I left Pittsburgh on September 2, with the river at a good stage, and made thirty-five miles in half a day.

Sept. 3.—Made a stop at East Liverpool, and the people at the potteries offered me lots of specimens, but I had to decline them as I had no room for stowing. Made a short stop at Steubenville. Found plenty of good camping places on the river.

Sept. 4.—Rainy part of day, had to keep waterproofs handy; made a short stop at Wheeling, where the people thought I was a curiosity and did not see why I was making the trip.

Sept. 5.—A quiet day with few showers; the river was very crooked and the water muddy.

Sept. 6.—Weather cleared up finely. I stopped at Parkersburg for supplies. As it was Sunday I made an early camp, striking a fine spot, everything calm and clear. It is a fine country to cruise through, but one has to hunt the wells for drinking water. The river is too muddy and springs are scarce.

Sept. 7.—I had a fine trip through a manufacturing country and could enjoy it, as the weather was fine. I made short stops at some of the towns. At Gallipolis the people wanted to know what I was advertising and would not believe I was traveling for pleasure. I got to be quite familiar with the crews on large steamboats and they would hail me regularly when we passed.

Sept. 8.—I got a little more rain, but it cleared up toward evening, but was still sultry and close. I camped for my first night in Kentucky, near Catlettsburg, just on the edge of the big tornado, which destroyed Washington Court House, Ohio. It was a grand sight in the distance, the sky was inky black and I could see terrific flashes of lightning. Above it was clear and bright. I was ready and expected to be blown away during the night and felt much relieved when morning came. Next day I heard of the results.

Sept. 9 and 10.—Quiet cruising, stopped at Ironton to mail letters and get supplies; had quite a crowd of boys following me and some of them wanted to know when I would have a street parade, as they took me for a traveling showman. Made a short stop at Vanceburg and met a young man that had the canoe fever badly, so I had to explain my rig to him.

Sept. 11.—Weather fine. I stopped at Ripley to see some friends.

Sept. 11.—Arrived at Cincinnati in the morning and stowed my canoe at a boat house, after which I hunted up some friends. I called on Dr. Heighway but could not find him at home; stopped here a couple of days taking in sights. I unfortunately drank some of their river water, which was very poor (I don't indulge in anything stronger). I was under the weather for a while.

Sept. 14.—I left Cincinnati at noon, clear and pleasant, plenty supplies, and made nearly forty miles and felt well enough to again camp in canoe.

Sept. 15.—A perfect day. Made a short stay at Madison.

Sept. 16.—The weather was getting pretty warm. I got to Louisville about noon, pulled up, and stowed things at the club house, cruised on land for a few days, to the Mammoth Cave and to Frankfort to see some friends.

Sept. 23.—I was glad to get on the water again, weather pleasant. I had a lively trip over the falls, covering about five miles in little over fifteen minutes. The water was rough and the wind blowing up stream.

Sept. 24.—Quiet and clear. I stopped at Brandenburg, where I found a couple of good live springs of water, which were very welcome, as I had only struck three good running springs the whole length of the river. Passed a quiet, lazy day, cooked dinner in the canoe while floating down stream.

Sept. 25-26.—All quiet and pleasant; made few stops and was much amused at the remarks made by the natives. One man wanted to know how much I had bet on the trip.

Sept. 27.—I stopped at Evansville for supplies, and laid in a good stock. Near here is the great bend in the river. Before evening rain began; I had struck the beginning of the equinoctial storms, which continued for four days and nights. It rained steadily day and night, and I had to wear rubbers all the time. It was very disagreeable, but I kept dry and got through all right to Cairo, which was the end of the river.

Oct. 1.—I found lots of darkies, all pretty lazy, and I induced one to help me pack up, and found out afterward when I had unpacked that he had stolen one of my rubber blankets. I was pretty well tanned by sun and from washing in the muddy river water, but managed to clean up and struck steamboat the same night for St. Louis, where I stayed a few days. There I met Dr. Neidé, and we took a trip to Creve Cœur Lake over Sunday, in company with Mr. Andrews of the Petrel. I finally reached home but after a short stay packed up and went to St. Paul. I left St. Paul October 17, in the evening, and cruised a few miles until I found a fine camp and good clear water. There were plenty of fine springs, something I missed on the Ohio.

Oct. 18.—The day opened bright, clear and frosty. I passed Red Rock, a point where Indians used to have a grand pow-wow once a year, and made a short stop at Red Wing and Maiden Rock. Both places have Indian names and some legend connected. I camped for the night near Lake City, which is situated nearly half way down Lake Pepin. The lake is about twenty-five miles long and three or four miles wide, and is very rough in stormy weather so it is dreaded by boats that push large lumber rafts down the stream, and many a raft has been smashed up by striking storms. I struck head winds and rough water, but worked through safely.

Oct. 19 was cold and frosty. I had breakfast ready and set up a temporary table which tipped over and spilled everything. As it was the last of the grub I had to go without breakfast. I made good time until I filled up my box again, and the food seemed much better after my mishap. It turned cold, rainy, and very disagreeable, but I struck Winona about camp time and found a good boat house where I stowed things and put up at a hotel, which I duly appreciated at times, as the rain turned to snow and ice.

Oct. 20.—It looked very wintry with the ground covered with snow and still blowing. I fixed up in good shape and started out in spite of bad weather, making a short stop at La Crosse. The weather cleared up but it was still cold.

Oct. 21.—Very cold but clear and bright with about half an inch of ice on edge of river. I pulled out early as it was getting late in the season and I had to make good time. I stopped with friends at Lansing for a short time. The river was crooked and narrow. I struck camp early each night, as the air was sharp and frosty and made one hunt up all extra bedding.

Oct. 22.—The weather was getting milder, so I made a short stop at McGregor with some friends. I wanted to make time, and my bow-facing oars came in handy, as I made sixty-five miles in about eight hours. I stayed in camp with a party of friends for several days. There was not much fishing, as the fishermen scine everything.

At last I finished my summer's trip with nothing but pleasant recollections and with regret that I could not continue. I made several short cruises later on and made my last trip on Dec. 1, with my log showing 2,500 miles to the credit of the Estella, No. 780. No. 780, A. C. A.

CANOES VS. SAILING BOATS.

THE "sloop-rigged clinker" mentioned by Mr. Shamp in his letter of Jan. 27 must have undergone some radical changes, as it was certainly printed "catboat" in his first letter. Mr. S. is in error when he thinks I owe one of the fast skiffs on the river; but if he wants to race and will kindly waive my ownership of the skiff (or perhaps canoe) I sail, and have the race open to no one else, and sail the boat mentioned in his article of Dec. 16, I will be happy to accommodate him for fun or for a prize, provided it becomes the personal property of the winner, as I have no skiff wherewith to hold it. I do own a canoe, but what her speed and ability are in comparison with his boat has nothing to do with the case, as I am willing to freely admit that many of the skiffs can beat her, and Mr. S.'s boat certainly ought to. Mention would not be made of her now but for fear of some future misunderstanding. My only excuse for inflicting this matter on a suffering community is to let those know, who consider the affair worthy of attention, that there are men in Buffalo who think we have skiffs that can beat any 15ft. 3in.x46in. boat. I trust that no further recourse will be had to these columns in this matter, as we are residents of the same city.

Did it ever occur to members of the A. C. A. that statements like that of Guenn's (he is certainly prominent enough to voice their sentiments) that boats outside the A. C. A. limits "have nothing in common" with canoes, might retard their progress in increasing their membership. Chambers's American Encyclopedia—a pretty good authority—says canoes have been built large enough to hold 20 or 30 hogsheads of sugar. In almost every club there are men owning so-called "wide" canoes, or boats, if it will please you better, but no 20-hogshead ones, I think. These "wide" men are generally as energetic, companionable and fond of cruising as the average. They are perfectly willing you should stick to your narrow craft if you please, but they do think they are worthy to be more than nominally admitted to the fraternity, that all virtue does not lie in a 15×30, that in all but extremely narrow or rapid streams they can hold their own, and do it with more comfort and safety—those are the words—not speed, for speed is not to be desired above everything on a cruise; and that the love of nature—the woods and waters, and their wonders, and the similarity of tastes, and means of gratifying them, should be more of a criterion than whether your boat is 33½ or 40in. wide. Does the A. C. A. gain anything by fighting these men, saying they "have nothing in common?" Which do you suppose has the most influence with the average canoeist—the desire for the society of the men with whom he sails, camps, eats, sleeps, smokes, chats around the cheery camp-fire; or that of an association, few, perhaps none of the members of which he ever saw? Will he be eager to join an association which says he "has nothing in common" with his chums, and which bars them out? And they wonder why the "wide" man doesn't attend the meet. He would rather be cruising or camping with kindred spirits who do not stop to ask the dimensions of his craft in inches before admitting it to their circle, than in a hostile camp. Racing is not his only joy. I have been a member for two years of a canoe club that has races occasionally, and never even saw one sailed or paddled, but I venture to say that, with one exception, who took a 300-mile trip last summer, no "true canoeist" in the club cruised more or camped oftener in that time than PERCH.

BUFFALO, Feb. 14.

A SPLIT IN THE I. C. A.—At the last regular meeting of the I. C. A., the admiral and the executive committee were both absent, so there was no quorum. In this emergency two candidates for membership who were present at once proceeded to elect each other, the ballot in both cases being unanimous. They then proceeded to impeach and remove the admiral and entire board of officers, after which a new election was called, resulting in the choice of Mr. E. W. Brown for Admiral.

A NEW CANOE ANCHOR.—The patent stockless anchor made by Mr. Wasteneys Smith, of England, is now made in sizes as small as 8lbs., especially for canoe use. The anchor is of gunmetal, and having no stock, lies flat and stows easily.

SQUARE STERNS VS. COUNTERS.

Editor Forest and Stream:

While reading of the qualities of the various craft that have been developed from the modern canoe, the Tomboy, Cassy, Viper, Mersey canoes and canoe yawls, the question arises as to wherein lies their superiority.

That the long pointed stern is superior to the square stern I, of course, can see; but is this long stern better in any way than the ordinary sailboat stern with an overhang or counter?

I have just ordered from Mr. Wickes, of Amityville, a boat similar to Mr. Martin's, 18ft.×5ft., pointed bow and stern as in a canoe.

The question as to the advantage of such a stern is now important to me, as I may alter the plans.

To judge from the prevalence of the overhanging stern and the rarity of the canoe stern I should infer that on the same outside dimensions a better boat could be built with a keel 15 to 16ft, and an overhanging stern 2 or 3ft., giving a broader deck at stern.

Will you, through your columns, kindly tell me and the many others who would, I am sure, profit by the information, which of the two examples above mentioned would make the better boat and why?

Does the canoe stern leave the water more easily? Does it rise more quickly to a following sea? Does it add to speed or to safety? G. H. S.

NEW YORK, Feb. 3.

[If the question be put in the form of "what is the best boat on a given waterline, say 16ft.," it would be easy to answer it by designing one with a handsome little counter, adding to the deck room and permitting a much fairer and better afterbody than with a square-stirned boat. The cost, however, would be considerably greater than with the latter. If, now, instead of the 16ft. boat being cut off with a square stern she is run out to 18ft. with a double end, she is a larger and abler boat, the lines may be ended better, and the extra cost is very small owing to the ease and simplicity of the construction. This is the chief reason why we have advocated the "canoe yawl" type, as a strong, staunch and able boat may be had for much less than the orthodox counter-stern yacht would cost.]

THE RUCKAWAS.

LESS than a year ago two enthusiastic young men agitated canoeing in Dayton, Ohio, and could any old canoer have sat round the groaning board and listened to the flow of soul at their camp-fire, Jan. 26, he would not have supposed the club was just entering the second season of its existence.

Sixteen sat round the table in the ordinary of the Beckel House. They were all members of the W. C. A. Twelve were Ruckawas: Captain Gaddis, Mate Woodruff, Purser Fowler, Fox, McKee, Van Ausdal, Patterson, Bunstein, Daniels, Craighead, Crawford and Iddings. The guests were from the Cincinnati, Miami and Jabberwok clubs, Messrs. Crane, Stedman, Shiras and Warder.

The club with a big R. has enjoyed a limited membership of 15, but in view of the erection of a $300 boat house and several applications for membership, they have increased their limit to an even score.

The table was perfect. Heaped high in the center was a bank of flowers, the gift of Mrs. Gaddis, while the silver and tinkling candelabra were kindly furnished by Mrs. Fox.

The menu was all that Senegambian-French could deftly originate, the Hock and Mumm incomparable, and the cigars entirely too good to be wasted upon such smoke consumers.

In three hours the entire party, including the new member Craighead, magnanimously forgave the unfeeling (?) A. C. A. her past coldness, plied her present vicissitudes and resolved to eat no more humble pie for youthful indiscretions of the wayfathers of the W. C. A., but to pursue her even tenor, gladly welcoming the new members and pointing with pride to the bulged appearance of the treasurer's wallet.

Ruckawa—running water! Could a more suitable title be selected for a club of enthusiastic actual cruisers? The paddle is their totem, the rushing rapid the cadence of their name. Happy indeed the stranger who finds himself near the blue Miami, the Ruckawas are the soul of hospitality, their hands and hearts are ever open, the latchstring always out. JABBERWOCK.

QUAKER CITY C. C.—The Q. C. C. C. held their first camp-fire on Jan. 18, at their city headquarters on Sixth street. The subject, "Canoe Tents and Camp Beds," was freely discussed, beginning with the shelter tents and continuing with the Mohican, "A" tents, etc., for canoes; then the Clyde, marquee, wedge tents, etc. The tents having been discussed the next question was canoe beds. After a variety of sleeping bags, quilts, rubber pouches, etc., were discussed the camp-fire ended, every one being pleased with the evening's entertainment. Jan. 23 being a warm day three members launched canoes and paddled about for an hour.

KNICKERBOCKER C. C.—The annual dinner of the K. C. C. was held at Morello's on Feb. 5, the club and a number of invited guests being present. Letters of regret from President Cleveland, H. R. H. the Prince of Wales, Governor Hill, Sergeant Billings, Uncle Mike Delaney, and many other prominent personages, were read by the secretary. In the center of the table was a figure of a sea orse, the club's totem, presented by Messrs. Scavey and Fowler, the handiwork of the former gentleman. Speeches were made and songs were sung, the evening passing off very pleasantly.

A. C. A.—A special meeting of the Executive Committee of the A. C. A. to consider the unfinished business left from the November meeting, has been called for Feb. 12, at New York. It is probable that several applications for new divisions will be made.

BAYONNE C. C.—At the annual meeting of the Bayonne C. C., the following officers were elected: Louis F. Burke, Commodore; Fred. B. Colins, Vice-Commodore; William Rumble, Jr., Secretary-Treasurer.

YONKERS C. C.—At a meeting of the Yonkers C. C., held Feb. 1, the following officers were elected: F. K. Shears, Commodore; Talbot Simpson, Vice-Commodore; Louis Simpson, Secretary.

Yachting.

Address all communications to the Forest and Stream Pub. Co.

THE CLASSIFICATION OF RACING YACHTS.

WITH a large number of small organizations engaged in the same object, working for the same ends with the same means, and with all interests in common, it would seem the most natural thing possible for all to combine in a union that would join them closely together, rather than that they should continue to stumble along in a helpless independence of each other. The former course has been followed by many of the clubs connected with outdoor sports in this country, such as the League of American Wheelmen, the National Association of Amateur Oarsmen, and the American Canoe Association, in all of these cases with the best results; but while the necessity for such union of yachtsmen is just as apparent, the many attempts which have been made toward one have all resulted in failure. The reasons for these failures it is not necessary to consider here, as we do not propose now to inaugurate another attempt. The usual mode of organizing, that followed successfully by the canoeists for instance, is to call together a number of representatives, who will elect officers, adopt a constitution, and enact laws which will be generally recognized by the followers of the sport; but this method has been tried more than once in yachting, and always without a show of success.

The need of some sort of general legislation in regard to yachting is more apparent each year as the relations of the clubs become closer and each is concerned, to a certain extent, in the doings of its neighbors. It is not so many years since not only each locality but each separate club was a law unto itself, independent of others and caring little what they did. Not only did the boats confine their racing to home waters, but inter-club racing was far less general. Now, however, all has changed. Not only the larger yachts but many small ones are in the habit of knocking about between Boston and New York, to Larchmont, Marblehead, Newport, New Bedford, wherever a prize is raced for, while the races of each club are generally open to the yachts of fellow clubs. This being the case, it is readily seen how great the need is for some general direction of affairs, and for a certain amount at least, of general legislation.

As we have stated, the attempts to organize a national association which should accomplish certain ends have all failed; what we propose to show now is how some of these ends may be directly attained, with the best possible effect on American yachting; while this action in itself will be a great step toward the formation of an association when the proper time comes. Were such a body in existence there are many important questions involving the future of American yachting that would demand its fullest consideration, but the most important are those governing the

design and construction of yachts. It should be within the province of such a body to enact laws that would encourage a class of yachts in every way calculated to further the growth and popularity of the sport both in the racing and cruising classes; and also to prohibit, as far as may fairly be done, the construction of racing machines, and all other acts detrimental to the general good.

One of the most pressing questions now before the clubs, one in fact in which prompt action is necessary if much confusion and trouble in the immediate future is to be avoided, is that of a uniform and systematic classification of the racing fleet. That it is needed for the promotion of the races of this year and next, for immediate use, is shown by an inspection of the classes of the leading clubs of the "Atlantic system," if we may coin a term, in which is included the bulk of American yacht racing. We take only the cabin sloops, cutters and yawls, as what is true of them is also true of the schooners, while the classification of the smaller open boats is not only under different conditions but is much less important than the larger sloops and cutters.

The classes in the five larger clubs are as follows, the waterline length being taken in the New York, Seawanhaka and Eastern, while the Atlantic and Larchmont use the corrected length for classification as well as for time allowance. Before going further it may be well to state that we have not the slightest intention of reviving a discussion of the measurement question; most yachtsmen realize by this time that measurement and time allowance is one thing, while the classification of yachts is another and very different matter. Even if all the clubs should adopt a uniform system of classes for the racing fleet, any club would still be at liberty to adhere to its pet absurdity in the way of measurement, no matter how bad it might be. It will be noticed that even in naming the classes no system is followed, some clubs using Class I., II., etc.; some First Class, Second Class, etc., and some Class A, B, C, etc.

TABLE I.—RACING CLASSES.

New York—Class I., over 70ft.; Class II., 55 and under 70ft.; Class III., 45 and under 55ft.; Class IV., under 45ft.

Seawanhaka—First Class, 71ft. and over; Second Class, 55 and under 71ft.; Third Class, 45 and under 55ft.; Fourth Class, 35 and under 45ft.; Fifth Class, under 35ft.

Larchmont—Class C, 55ft. and over; Class I., 42 and under 55ft.; Class II., 33 and under 42ft.; Class III., 25 and under 33ft.; Class IV., under 25ft.

Atlantic—Class C, 60ft. and over; Class D, 50 and under 60ft.; Class E, 42 and under 50ft.; Class F, 35 and under 42ft.; Class G, 30 and under 35ft.; Class H, 26 and under 30ft.; Class I, under 26ft.

Eastern—First Class, 75ft. and over; Second Class, 55 and under 75ft.; Third Class, 40 and under 55ft.; Fourth Class, 30 and under 35ft.

The same divisions are shown more clearly in Table II., where the letters and figures to the left of the column of names show in each case a class division of some club; thus, N. Y. I., above 70ft., denotes the lower limit of Class I. in the New York Y. C.

Thus it will be seen that a yacht that races with her equals one day may be classed with boats of twice her size the next in some other club. An instance of this occurred in the E. Y. C. last year when Ulidia, 42ft., was put against Clara, 53.7, and Active, 50.2ft. Further than this, the tendency naturally is to build up to the class limit, and when yacht building fairly begins again this will be done. A yacht then built to the E. Y. C., second class, just under 75ft., will in the N. Y. Y. C. races be classed, not with the Class II. boats, 70ft., but with Priscilla, 85ft., and this maintains among all the clubs and in all classes.

What, then, is the remedy and how can it be applied? The matter is simple enough, and no association nor machinery of that kind is required. Let one of the clubs named bring up the subject at its next meeting, put it in the shape of a definite proposal, to save time and correspondence, and submit it to the other clubs asking their coöperation. Acting together the matter may be easily and quickly arranged, and the system adopted by all, in which case its adoption by the smaller clubs must speedily follow. It is so manifestly to the interests of all that no objection seems possible; besides which, if such action be taken by only three or four clubs, the others cannot afford to stand aloof. If this manner can be carried through successfully in the above manner a double end will be gained; not only will a most important reform have been accomplished, but a practical method of reaching similar ends will have been inaugurated, and the first real step toward a union of the clubs will have been made before they are themselves aware of it. After this a similar course will naturally be followed with other questions as they come up, the ice will have been broken, and the question of a national association is only one of time.

Just now the occasion is specially propitious, the question of measurement has been laid at rest, for some time, we hope, while the leaders are turning their attention to other and much needed reforms, as shown in the new sailing rules of the Seawanhaka C. Y. C. in another column. The question of vested interests cannot yet be advanced as an objection and the change can at once be made without jar or friction. The fleet at present is in a state of transition highly favorable to immediate action, and if anything is to be done a better opportunity will never be found.

It is rather curious that while the interest in yacht racing has never before been as strong nor as widely spread, no racing yachts were built last year and few are now building. We do not include the large boats built only for a special purpose, as they show little as to the growth of yachting in general, but last year only Cinderella was added to the fleet, and thus far but two yachts have been commenced, and both of those with reference to the Cup races of the coming season. Why is this when American yachting is profiting from the successes of the past two seasons? We attribute it solely to the uncertainty in which the races of 1885 and 1886, in spite of much self-congratulation and spread-eagleism, have left American yachtsmen. Two years ago the ancient sloop was completely abandoned and only one more victory for the cutter was necessary to bring down off the fence the many weak-kneed ones who had almost succumbed to the logic of events, and cause them to go to extremes in lead and depth that would have astonished the crew of a British racing three-tonner. A victory for Genesta would have seen a cutter craze inaugurated here that would have sent the price of lead up higher than gold in war times; beam and depth would have exchanged values, and there is no telling to what extreme the new fad might have been carried. It is needless now to state that the decision was postponed," first to 1886 and now, for the last time we hope, to 1887. The new "sloops" were hailed on all hands as the saviors of American yachting, the acme of design and construction, and, overlooking the origin of their salient features, the cutter came in for universal condemnation.

In spite of all this the facts do not show any pressing hurry to supply the places of the old boats with the new type, and we believe that yachtsmen, in spite of much confident talk, are perfectly willing to see the fight fought to a finish before risking their ducats in a boat that is likely to be soon left behind in the rapid progress now making toward something better. It is certain that few yachtsmen want narrow cutters just now, but it is equally certain that they are not building "sloops," and not until some more definite conclusion is reached will an earnest effort be made to revive the racing fleet. It must come some day, wealth and a love of outdoor sports are both increasing, and a glance at the list below shows that most of the present fleet, many of which have only earned a place on the list by virtue of one or two races in the last two years, must speedily disappear. Now, when the component elements of American yachting are in this plastic state, is the time when a change may most easily be made, and also when, for the future good, it is most important that it should be.

What, then, are the essentials of such a system? We place first stability, the certainty that when a yacht is built to a fixed class she will not be forced into another. This is essential to promote building, as a man who builds to beat a certain class or boat is likely to consider himself defrauded if forced into another by any change, or if his adversary evades him by escaping into a higher or lower class. This feature is assured by a waterline length, the proper basis for bringing yachts together on fairly equal terms, to be further adjusted by a suitable time allowance. The waterline length of a vessel remains practically unchanged, unless extensive alterations of hull are made, and there need be no serious difficulty in classing by it. When, as sometimes happens, a yacht is so near the limit that the matter is at all doubtful, as in the case of Bedouin, only 1¼in. over 70ft., she may, if built prior to the enactment of the rule, and if she does not exceed the limit by over a foot, be allowed to register permanently in the lower class. Of course no actual unfairness would result, as she still allows time on her actual measurement. This was finally done in Bedouin's case as, she was put with Gracie and the rest of her size, though technically classed with Mayflower and Priscilla.

Besides being fixed and not subject to change at any time, the classes should be such as to exert the best influence on the boats and to encourage those sizes that experience has shown to be most desirable; and they should be so divided as to bring the boats together in groups of about uniform length, thus minimizing the necessary inequalities of all time allowance systems. For instance, the third class in the E. Y. C., 40 to 55ft., and the Class I. in the L. Y. C., 42 to 55ft., practically disbar a yacht of 42 to 45ft. when matched against one of over 54ft.

Another important point is more closely connected with this question of classification than is commonly supposed. Each year renewed complaints are heard from regatta committees as to the paucity of the entries, and many reasons are advanced for the same, such as lack of big prizes, measurement rules, etc. We believe that the chief trouble arises from such inequalities as we have quoted, where the second-rate boats that are near the lower limit of the class decline to enter against one or two newer boats built up to the full limit. This difficulty is increased by the fact that the fleet in any open regatta is made up of boats built at various times and under many different club rules, an assorted lot of sizes, and this would in time disappear if settled classes were formed, as the racers would naturally gravitate to the upper limit of each class. Just now its working may be plainly seen in any large race.

The objection to many classes is the expense of prizes, but this is not worth considering for a moment. The large yacht clubs are essentially racing clubs, and it is through racing mainly that many of them are kept alive. This racing means at most two regattas each year and more probably only one. Now the extra prize or two required would amount to $100 or $200 at the most, and may make just the difference between a success and a failure. If the club has not this money when let the total sum be divided into more and smaller prizes, but let every man have a chance at them, and the result will be far more satisfactory. Big money prizes are not yet common with the clubs, the figure seldom runs above $250 for the largest schooner races, and $100 would be much nearer to the average value of money prizes in the leading clubs. Yacht racing as a money making business has not yet been introduced here, and what each owner wants is sport. This can best be had by breaking the fleet up into many small groups of evenly matched boats, in any of which a man will have as fair a chance as the qualities of his boat, himself and his crew entitle him to. We may cite the Atlantic Y. C. as an instance, the prizes are of moderate value, but there are no less than nine classes for single stick boats, with the result that every yacht in the fleet can find a place with several of about her own size. Every year this club turns out the largest fleet in the June regattas, while the Knickerbocker and Larchmont clubs can show a similar experience. It may be said that this is due to the small boats in these fleets, but this is only a minor reason, as the surplus is made up mainly of yachts that are no longer in the first rank, and that will not enter and face a new crack of greater size.

To sum up, then, the system must be of such evident merit that its permanency is reasonably assured; it must group the boats fairly together; it must encourage the most desirable classes, and finally, it must work as little injustice as possible to existing boats.

How many yachts constitute the racing fleet from Boston to New York? The following list is compiled from the books of the five clubs mentioned, with the aid of the list of races for last year, and includes nearly all above 35ft. that can fairly be called racing yachts; in fact, any one going over the list carefully will be able to check off a large number as no longer capable of prize winning. The list from 30 to 35ft. includes the leading boats, enough to show the average sizes, while below 30ft. it might be much increased, both from the New York and Boston fleets, but a fairly representative lot are given:

TABLE II.—RACING YACHTS.

Existing Classes.		Ft. In.	Proposed Classes.
	Mayflower	85.00	Class I.
	Priscilla	85.00	
	Atlantic	82.01

L. Class III., 25			—25
S. 5th Class, all under 35			Class IX., 21.
L. Class IV., all under 25			Class X., 18.
A. Class I., all under 26			

The list includes seventy-five yachts, keel and centerboard, from 85ft. down to 25ft. L.W.L., and of these fifty-two are above 35ft., and may be taken as the main division of the fleet, being large enough to make passages and to seek prizes beyond their home waters. It has been the general custom in existing classifications to make the interval between each class either five or ten feet, the Atlantic and Larchmont clubs being exceptions, but there is no reason for so doing; in fact, there is a very good reason to the contrary, as the intervals should increase regularly in length as the size of the boat is greater; thus, where the small classes differ by five, the intervals between the larger should be greater as the size increase. If it were possible to disregard all existing boats and to start entirely unrestricted, the class divisions might be placed so that the intervals should increase by some fixed rate of progression; but while this would be theoretically correct it is manifestly impossible, as it would throw out the existing fleet.

The question then is, "What can be done without too radical alteration?" Two plans suggest themselves, one easily carried out and answering fairly; the other, more difficult to bring about, but far better in the end. Looking at Table II., the lowest division is 25ft., the starting point for such yachts as we are now considering. Scanning the list upward, the best point for the first break is at 30ft. This would make the class, in the usual phraseology, "25ft. and under 30ft.," and the same method of designating each class will be followed throughout. Continuing upward the next point is at 35ft., bringing together a lot of boats reasonably close in size. The interval here is the same as in the class below and that above, 5ft.; and while this does not quite coincide with theory, it makes a good division of existing boats and is not far out as a standard for future classes.

The next division then is at 40ft., and this will include half a dozen boats that are very fairly matched. The smallest boat in the class, Surf, was built to suit the class below and has always raced in it, so she should be allowed to remain in it if she so elects her length being only 4in. over the limit.

The limit of the second class above has long been fixed in nearly all the clubs at "under 55ft," and now it would hardly be possible, to change it very much. No such necessity exists, however, as the limit is a very convenient one; the only question being to so divide the long interval of 15ft. (from 40 to 55) as to strengthen one of the worst places in the existing order of things. The point we have fixed on is at 47ft., including a lot of boats that together may still make good sport, but that have no more business with Clara and Cinderella, to say nothing of future additions to the class, than they have with Mayflower. As far as most of them are concerned the limit might have been left at 45ft., but then the next interval, 10ft., would have been too great. As it is they are well grouped, but the two lower ones in the class above, Valkyr and Regina, should be allowed to remain with them, being only 3 and 4in. above the limit.

The next class remains as now and shows a fairly matched lot. Of course Clara and Cinderella will always remain at one end in the racing and the others will come in pretty much as they now stand in the order of length, but no classification nor time allowance can or should change this, so they cannot grumble.

Thus far it has been all plain sailing, but now the trouble begins. The next existing limit is 70ft., but this is not in every way the best possible, as the interval is too great (15ft.), while all but two of the boats are from 60 to 66ft., these two being 70ft. A due regard for the rights of the boats concerned, Bedouin, Gracie, Shamrock and Mr. Iselin's unnamed craft, would dictate a retention of the present limit, say 70ft.; and unless the owners of these yachts consented to a change it could not fairly be made. Apart from this consideration the proper division would seem to be first at 65ft., leaving in one group a lot of yachts of about one length, few of which can now be called first-rate, or that will be "in it" with the latest additions to the class as it stands. Three of these, Fanny, Ileen and Stranger, are slightly over the limit, but they would be provided for as in the previous cases, remaining where they would find their nearest rivals. We place the limit at 65ft. rather than 66ft., as the interval of 10ft. from 55 to 65, and also from 65 to 75, is more correct than the intervals of 11 and 9ft. would be. The limit for Bedouin's new class would be "under 75ft." and would include, besides her, Gracie, Mr. Iselin's new boat, and Mr. Maxwell's new Shamrock all practically of 70ft., and making a fine nucleus for a class that will soon be well built up to. It may be objected that this would subject these boats, built to the limit of an existing class, to the chance of being, to a certain extent, outbuilt by new boats that may be some 5ft. longer. It is also possible that Stranger might object to being parted from her pet rival among the cutters. These considerations make the case a difficult and delicate one to deal with, but it would seem that the future interests of this most popular size of yacht would be better promoted by placing the classes at 65 and 75 than by any compromise; and if this is so there are few individual owners who would not sacrifice their wishes to a certain extent for the general good. If the class were maintained at 70 or 71ft. it would leave a long and awkward interval (15ft.) between the two classes, that would exist long after the yachts in whose favor it was made had dropped from the racing fleet, while so many will have been built by that time as to make a change impossible. The evidence then seems to be in favor of placing the limits at 55, 65 and 75ft., leaving all above 75ft. for the large class, which needs no maximum limit.

This then would make eight classes as follows:

Class I .....75 and over	Class V. .....40 and under 47
Class II.....65 and under 75	Class VI. .....35 and under 40
Class III .....55 and under 65	Class VII. .....30 and under 35
Class IV. .....47 and under 55	Class VIII. .....25 and under 30

Another division that would increase the intervals more regularly would be 25, 30, 35, 41, 48, 56, 65, 75, the successive intervals above 30ft. being 5, 6, 7, 8, 9 and 10ft. This would not interfere materially with any existing boats, though it would raise the limit in the 55ft. class to 56ft., while it would be a more reasonable and systematic plan for future building.

A careful examination of both methods and a comparison with the list of yachts will show, we think, that each possesses the main requisites set forth above, and that it will work at least as well as any similar plan, both in relation to the present and the future fleet. Supposing one to be adopted by all or any of the clubs we have mentioned, some care and discretion would be necessary for one or two seasons. Some of the classes might not fill, though we anticipate that more entries would at once result. Some concessions and some latitude in the strict enforcement of the rule on the part of regatta committees might be needed to make all run smoothly in the first season, but after that in all probability no further trouble would occur. The need for some action is obvious; matters are bad enough as they are, but they must grow rapidly worse if nothing is done, and we believe that this plan, with such modifications as may suggest themselves after a thorough discussion, will not only answer well in the future, but can be put in immediate operation as easily as any. To correct, in one or two seasons, evils that have been many years in existence, is no small task, and some difficulty must be expected. One advantage on the score of expediency that this plan possesses is that it would prolong the racing career by a few years of some half dozen yachts from 60 to 66ft., whose day is over as things are now with two new boats and Bedouin in their class, while the same would be true in the class from 40 to 47ft.

Our proposition then to put it in working shape is that the leading clubs unite in the adoption of a common system of classification such as is given above, with the following proviso added: "Yachts built or building up to (for instance) May 1, 1887, that exceed the highest limit of any class by not more than one foot, may be formally enrolled in that class and shall then remain in it." All new yachts would, of course, be built to the new classes.

The schooner classes we have not considered for lack of space, but a similar course is necessary with them.

As to the sizes below 25ft., they are not of the same importance as the large yachts, as their racing is mainly local, but there is room for improvement with them. The proper limits for small cabin yachts, either keel or centerboard, seem to be 18 and 21ft., carrying the proposed classification down to two more classes. The keel class in these two sizes is as yet in its infancy and nothing has been done toward its systematic development by any of the clubs that encourage it. Now we suggest that the friends of this class of yacht in the Larchmont, the Seawanhaka, the New Rochelle, the Corinthian of Marblehead, and similar clubs in which these boats have found a footing, take action at once to formulate a class limit, say for lengths of 18, 21 and 25ft., which shall encourage a safe, handy and not too costly boat; that, while fit for cruising, may find plenty of good racing with others of its class. It is a prime requisite for the success of this class that the cost shall be kept low, as it is for the special use of young Corinthians, most of whom possess pocketbooks in inverse ratio to their love of sport. All such boats as the modern three and five-tonners must be excluded, as they are far too costly; but what is needed is such craft as the Columbine, Witch, Windward, Fad, Saracen, Mignonette, the new Burgess keel cats and others. To secure this end it will be necessary, perhaps, to restrict draft, say to 4ft. 6in. for an 18ft. boat, keel say 1 ton, and sail area to a fixed figure, with limits to spinaker booms, topsails, etc., if considered necessary. Of course, the various class limits must be purely arbitrary, but it has been done successfully by foreign clubs; and those specially interested in this class of boat, and they are many already, can easily lay down proper restrictions. The Kingston and Munster (Ireland) clubs have done the same with the results that they have built up very fine classes of small yachts; while the Bangor Corinthians, by a similar course, have created a class of 25-footers, one of which, the Bedouin, by Wm. Fife, Jr., is as handsome and wholesome a boat as one would wish to see, and would serve excellently as a model on which to frame a 25ft. class. Of course, there would still be a place for other types of the same length, but what is needed now is a special movement in behalf of a suitable fleet for the young Corinthians. We have considered thus far only the yachts in a limited locality, but if this classification be generally adopted it will not be long before a Class I. or II. boat will be the same throughout the United States.

We realize that a certain amount of difficulty must attend any such reforms as we have proposed, due to the inertia of the average yachtsman in all that relates to legislation and dry discussions. He is perfectly willing to stand quietly by and let others work, go on committees, and propose laws without securing enough of him at a meeting to make a quorum for their passage, and all this time he reserves the inalienable right of kicking if his own interests are in any way threatened. There are, fortunately, in all clubs, others who have the interests of yachting strongly at heart, and to them we speak in the hope that good may come. As so important a matter requires to be thoroughly discussed and understood before final action is taken, and as, from the nature of the case a general meeting of the parties interested is not possible, we invite criticism and suggestions through the columns of the FOREST AND STREAM, promising such aid as is in our power.

THE THISTLE'S DESIGNER AND THE NEWSPAPERS.

THE following is a copy of a letter from Mr. Geo. L. Watson to the editor of the New York *Herald*, relating to a reported interview by a *Herald* correspondent. It calls to mind a remark made by another *Herald* reporter last fall while he and others were in hot chase after Mr. Watson, then on a visit to New York. The reporter said: "I do not want to trouble Mr. Watson or to talk to him, but let me only get near enough to say 'How do you do, Mr. Watson,' and I'll tend to the interview."

The letter has not yet (Feb. 9) appeared in the *Herald*, but it probably will be given an early place.

JAN. 26, 1887.

Editor New York Herald:

I am in receipt of the *Herald* of 14th inst., in which there appears what purports to be an interview with me by a representative of yours hailing from Greenock. As I was treated with the utmost kindness and courtesy by your representative when in New York, I should be sorry to see your paper in any way imposed on, and therefore think it fair to let you know that no such interview ever took place. Your correspondent has been singularly unfortunate in choosing his date for the supposed interview, as it happened that on the morning of Jan. 13 I was on my way home from London, only getting to the office late in the afternoon, where I stayed only a few minutes to write a letter, seeing no one, and went off home.

The only press man who interviewed me regarding the authenticity of the plans published by the Boston *Herald*, was a Glasgow *Herald* reporter (this was in the first week in January, when the news had only been cabled across), and to him I gave the answer which I have given to every one, viz., that I must decline to give them any information whatever on the matter.

Once for all I may say that in my opinion we should be guilty of a grave discourtesy to the New York Y. C. were we to disclose the dimensions of the Thistle, unless through them, and as the conditions of the deed of gift stipulate that the challenge, with the accompanying dimensions of the vessel, be lodged, "not exceeding seven months from the date of the race," it must still be a little time before they are made public. I am sir, faithfully yours,

G. L. WATSON.

In a private letter concerning the alleged plans of the Thistle Mr. Watson says: "Now, as to the plans, they are undoubtedly copies of one of the lithographed plans issued by us to builders along with the specifications, to explain details of structure and give them an idea of the nature of the work: but I asked tenders for some eight new boats this year besides Thistle, and the chances of these plans being Thistle's are matters for a very simple calculation. * * * If, therefore, yachtsmen, or rather newspaper yachtsmen, chose to put 2 and 2 together and make 14, I am not going to hinder them, nor am I going to say whether in my opinion 2 and 2 makes 14 or 47."

NEW SAILING REGULATIONS OF THE S. C. Y. C.

FOR some time past the question of a thorough revision of their sailing rules has been under consideration by the Seawanhaka Corinthian Y. C., and last November a committee was appointed to make such a revision and submit it to the club. The result of their work has lately been printed and sent out to the members and will come up for ratification at a special meeting on Feb. 14. The new rules, as given in the report of the committee, show a great improvement in two respects; first, the general arrangement of the matter has been much improved, the most important rules, those relating to the actual handling of yachts while racing, having been collected in one rule, No. XXXIV., under the heading "Right of Way," which is in turn divided into several sub-heads. This arrangement is far more convenient and systematic than the old. The principal change, however, is in the rule relating to luffing, which has been so altered as to prevent the orthodox "luffing match" as fully as can be done. The new rule prohibits luffing after an overlap has been established. The general rules as to crews, entries, sails, etc., have not been changed to any important extent, the wording only being altered to make the meaning clearer. One new rule, however, has been added to this part as follows: "Boats, Lifebuoys, etc. (1) First and second class schooners, sloops, cutters and yawls shall carry on deck during club races a serviceable round-bottomed boat, with oars and tholepins or rowlocks, lashed in, measuring not less than 12ft. in length; third class sloops, cutters and yawls a boat not less than 10ft. (2) All yachts shall carry on deck two serviceable lifebuoys ready for use."

The following extracts contain the most important points of the new rules, and we commend them to the careful consideration of all yachtsmen, as they embody the most intricate questions of match sailing. Every change has been carefully considered and discussed, and an effort has been made to put the matter in a form that will not call for alteration in a long time. A change will be noticed in Rule XXXIII. (2), where the mast is taken for the measuring point, instead of "any portion of hull or spars," an arrangement that coincides better with general practice in the similar cases of starting and finishing. The Special Rules are both new and cover important points in sailing. They were only adopted after thorough discussion:

RULE XXXIII.

START AND FINISH.

(1.) All starts shall be flying.

(2.) The time at the start and finish shall be taken when the point marked by the foremast in schooners, and the mainmast in single-masted vessels and yawls, crosses the given line; but if this point in any yacht be on or across the line before the signal for the start in her class is given, she must return and re-cross the line.

(3.) A yacht so returning, or one working into position from the wrong side of the line after the signal for the start has been made, must keep clear of, and give way to, all competing yachts.

RULE XXXIV.

RIGHT OF WAY.

I. *General Rules.*

When two yachts are sailing on courses that will involve risk of collision, one of them shall keep out of the way of the other, as follows:

(*a.*) A yacht overtaking another shall keep out of the way of the yacht which is being overtaken.

(*b.*) A yacht which is sailing free shall keep out of the way of a yacht which is closed-hauled.

(*c.*) A yacht which is close-hauled on the port tack shall keep out of the way of a yacht which is close-hauled on the starboard tack.

(*d.*) When two yachts are sailing free with the wind on different sides, the yacht which has the wind on the port side shall keep out of the way of the other.

(*e.*) When two yachts are sailing free with the wind on the same side, the yacht which is to windward shall keep out of the way of the yacht which is to leeward.

(*f.*) A yacht which has the wind aft is deemed to be sailing free, and to have the wind on the side opposite to that on which she carries her main boom.

(*g.*) When, by the above rules, one of two yachts is to keep out of the way, the other shall keep her course.

II. *Special Rules.*

(*a.*) In case a yacht close-hauled tacks in proximity to another yacht, she must have filled away on her new course before she becomes entitled to the privilege of a yacht on the starboard tack or of a yacht being overtaken.

(*b.*) When two yachts, both close-hauled on the same tack, are converging, by reason of the leeward yacht holding a better wind and are in danger of collision, and neither can claim the rights of a yacht being overtaken, then the yacht to leeward shall keep out of the way.

III. *Overtaking, Luffing and Bearing Away.*

(*a.*) A yacht may luff as she pleases to prevent an overtaking yacht from passing her to windward, provided she begins to luff before an overlap has been established.

(*b.*) A yacht shall not bear away out of her course to prevent an overtaking yacht from passing to leeward.

(*c.*) An overtaking yacht must not alter her course until so far ahead as not to interfere with the yacht which she has overtaken.

IV. *Rounding and Passing Marks.*

(*a.*) Yachts when rounding or passing marks shall be governed by the foregoing Rules on Right of Way, except as hereinafter provided.

(*b.*) If an overlap has been established between two yachts when both of them can fetch by a mark, the outside yacht must give the inside yacht room to pass clear of the mark.

(*c.*) A yacht shall not, however, be justified in attempting to establish an overlap, and thus force a passage between another yacht and the mark, after the latter has altered her helm for the purpose of rounding.

(*d.*) A mark is any vessel, boat, buoy, or other object used to mark out the course, and does not, in this rule, involve any question of obstruction to sea room, for which see Section V. of this Rule.

(*e.*) An overlap is established between two yachts when the overtaking yacht has no longer a free choice on which side she will pass.

V. *Obstructions to Sea Room.*

(*a.*) When two yachts are approaching a pier, rock, shoal, or other obstruction, so that the inside yacht is in danger of running aground, or of fouling such obstruction, and cannot avoid it by altering her course without coming into collision with the outside yacht, then the outside yacht, whether she be the windward or the leeward yacht, must at once give room to the other, on being hailed to do so by the owner of the inside yacht or his representative.

(*b.*) In case the outside yacht is obliged to tack, in order to give room, the owner of the inside yacht or his representative shall be bound to see that the helm of his own yacht is put down and that she tacks at the same time, or as soon as she can do so, without risk of collision.

(*c.*) A mark is not an obstruction within the meaning of this rule.

RULE XXXV.

DISQUALIFICATION.

(1.) Every yacht must go fairly around the course, and must not touch any mark, but shall not be disqualified if wrongfully compelled to do so by another yacht.

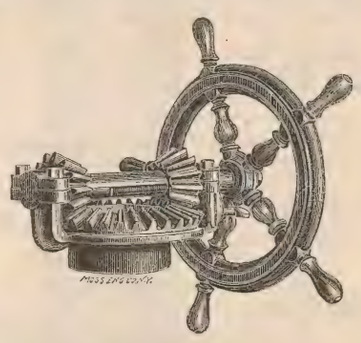
(2.) Any yacht causing a markboat to, in any way, shift her position, to avoid being fouled by such yacht, shall be disqualified.

(3.) If a yacht, in consequence of her neglect of any of these rules, shall foul another yacht, or compel another yacht to foul any yacht, mark, or obstruction, or to run aground, she shall be disqualified and shall pay all damages; and any yacht which shall wrongfully cause another to luff or bear away in order to avoid a collision, or shall, without due cause, compel another yacht to give room or tack, under Section V. of Rule XXXIV., or shall herself fail to tack, as required by paragraph (*b.*) of that section, or shall in any other way infringe or fail to comply with any of these rules, shall be disqualified.

The Seawanhaka C. Y. C. has always been noted for its efforts in the promotion of yachtsailing and racing, and in the adoption of the above rules it has accomplished a work that will add still further to its reputation. Of course only time can give a thorough test of their value, but we look to see the club's action ratified by a wide adoption of the new rules by other clubs.

The Seawanhaka Corinthian Y. C. has lately been incorporated, and at the special meeting on Feb. 14 at 8:30 P. M. at Delmonico's, beside the consideration of the rules as above, action will be taken to effect the change in the organization of the club consequent on its incorporation. The Secretary has received the following letter:

ROYAL THAMES YACHT CLUB, 7 Albemarle street, W., London, Jan. 21, 1887.



Dear Sir—The Committee of the Royal Thames Yacht Club, desire me to say that they trust that any of your members coming over for the Jubilee Ocean Race, will consider themselves honorary members of this club during their stay.

Yours faithfully, THORNTON SCOVELL, Secretary, R. T. Y. C.

To the Secretary of the Seawanhaka Corinthian Y. C., New York

A NEW AJUSTABLE STEERER.

WHILE there are many yachts of 20ft. or under, whose owners prefer the wheel to the tiller, the ordinary makes of steering gear are too large, and occupy more room than can well be spared in such small craft. To suit one of this special class of boats Mr. Oliver Adams, of the Gannet, Larchmont Y. C., has lately devised the steerer shown herewith, the main object being strength, simplicity and compactness, while an additional advantage is also obtained. The main portion is a strongly-proportioned casting, having two projections on top which form the bearings for the shaft. This

casting is let in the deck and strongly bolted down.' It is bored out internally and the upper face is turned, making a seat and bearing for a bevel wheel, which latter is fitted to the rudder post. As the bevel wheel fits snugly in its seat, the rudder head is firmly held, while it is prevented from rising by the two gears on the shaft. As the latter is of good diameter, and the bearings strong and only 8 to 10in. apart, there is no chance for the shaft to spring. Of course one of the pinions is an idler, simply serving to steady the large gear, while the other is keyed to the shaft. Both pinions have keyways cut, and the keyway in the shaft extends from bearing to bearing, so that with a hammer the key may readily be removed from one pinion and inserted in the other, thus reversing the action of the wheel. With the key as shown in the after pinion the wheel acts as the tiller, while with the forward pinion keyed the wheel acts as a ship's wheel. The gear is quite powerful and a small wheel may be used, while from its compactness and the strength of its parts, it is little liable to breakage. A clamping screw is provided for locking the rudder. Mr. Adams has an application now pending for a patent.

THE OCEAN YACHT RACE.—Mr. R. T. Bush has written as follows concerning the entry of centerboards in the ocean races:

NEW YORK, Feb. 4, 1887.

John H. Bird, Esq., Secretary New York Yacht Club.

Dear Sir—There has been so much talk about admitting centerboards in the proposed keel schooner race between Sandy Hook and Queenstown, that I think it would be an excellent plan for the centerboard people to get up a race to be started the same time with the Dauntless, Coronet and other keel schooners, and make the entry fee, if they choose, much smaller, say $1,000 or less. If such a race should be organized and open to keel schooners, I would be glad to enter the Coronet in that race also, as the boats would all start at one time, and would necessitate only one trip across. This would leave the race between the Dauntless and the Coronet and other large keel schooners that might be entered distinctive, and taking a hand in the centerboard race by the keel schooner owners would simply be for sport. Such a race would also be useful in comparing and testing the seaworthiness and sailing qualities of centerboard craft, as well as to determine in some measure the relative ocean speed of the keel and centerboard type. Yours very respectfully, R. T. BUSH.

It is most probable that the restrictions against centerboards, that have long excluded this class of yacht from the English regattas, will this year be removed, and at last a fair opportunity will be given to the American type to vindicate itself in foreign waters. The ocean passages of the little Alice are famous in American yachting annals, and it is only this unjust discrimination that has prevented other famous boats from winning as glorious laurels abroad as at home. After the successful ocean passages of such racing machines as Genesta, Galatea, and even the little Clara, of course none of the fleet will hesitate a moment about coming to the line on March 15, and this season will no doubt see such glorious names as Grayling, Comet, Nirvana, Albatross, Palmer, Peerless, Madeleine, it would be easy to run the list up to a score or more, as brilliantly and ineffacably inscribed on the page of British yachting, as on the glorious roster that has the stars and stripes at its head.

ANOTHER JUBILEE RACE.—The Royal London Y. C. now proposes to offer a prize, probably a cup of the value of $1,000, for an open race. The date will be in July or August and the course probably around the Isle of Wight. It is not decided whether centerboards will be admitted.

LARCHMONT Y. C.—The annual meeting and election was to take place last evening. Several important changes in the constitution and by-laws were to be acted upon. Thirty-six new names are on the list for election.

COLUMBIA Y. C.—The Columbia Y. C., of New York, gave their 20th annual ball on Jan. 31.

SOME SUGGESTIONS FOR SMALL CRUISERS.—In answer to an inquiry in the *Field*, Mr. J. W. Wilcocks, of Plymouth, Eng., makes the following interesting comparisons between the Mignonette and narrow boats: "In reply to 'Alectum,' I cannot say if any boats have been built on the lines of the Mignonette by any British builder (p. 146, plate xvii., of 'Small Yachts' by Mr. C. P. Kunhardt). She is given as a very successful light-draft keel yacht, yet draws 4ft. Much must depend on the cruising intended to be undertaken, but more head room can be given certainly with 4ft. draft, or an inch or two less. Her least freeboard is 1ft. 9in., and her greatest beam 7ft. 9in.; but there is no reason that a small yacht may not have more freeboard, somewhat less beam, and be a faster and drier boat to windward, without any or with little increase of draft of water, and yet have more head room, which is a matter of great importance in small craft. If 'Alectum' will look at the half-breadth plan of the Mignonette (plate xvii.), he cannot but notice a hollowness of L.W.L. and W.L. 2 in the fore body; this, it may be said, is more than compensated by her beam, which is considerable for her length and draft. Is it not better to have a little less beam, no hollow, and the same or a little more draft? At page 165 (plate xxiv.), we have the Columbine as an instance under the head of deep-draft keel yachts, and on inspecting the half-breadth plan we find that these lines, although still hollow, are much less so than those of Mignonette, that she has 7ft. instead of 7ft. 9in. beam, and 2ft. least freeboard as compared with 1ft. 9in. of Mignonette. It is true that she has 4ft. 4in. draft, but the additional 4in. can scarcely be considered detrimental, and is, of course, beneficial on a wind. The hold of the water in Mignonette is to the depth of 18in. below the rabbet amidships, and is obtained by the keel, which, as a matter of course, if she should ground without legs, must throw a considerable strain on the garboards; but in boats of deeper body and less rank keel, with a keel of greater breadth the same hold is obtainable, with increased internal depth, but without any increase of draft of water. I should, therefore, look on the form of Columbine as superior as an all-round boat to Mignonette, as she has a broad modern keel, 2in. across at its under part, and 9in. across the bottom, with a depth of 2ft. 9in. at amidships. This, however, seems overdone, as her keel is very rank for grounding, except on legs, and any cruising yacht should be strong enough to bear grounding on her side on fair ground without damage, to which end, although she must have a broad keel, it need not be nearly as deep as that of the Columbine, unless for racing; and we are now considering a cruising craft, which certainly should carry part of her ballast inside, of which there is no mention at p. 165. At p. 366 of 'Yacht and Boat Sailing,' Mr. Dixon Kemp gives us plans of a single-handed cruising 8ctben yawl, designed by himself for Mr. Percy Aylmer in 1885, having length over all, 27ft. 3in.; stem to sternpost on deck, 23ft. 4in.; on W.L., 22ft.; extreme beam, 6ft. 6in.; extreme draft of water, 3ft. 10in.; weight of lead keel, 18 tons. Her least freeboard is 2ft. 3in., which is a great gain over Mignonette. The difference in deck room is against the yawl—6ft. 6in., as compared with 7ft. 9in.; but if the beam were brought up another 6in.—namely, to that of the Columbine, I think 'Alectum' would find it sufficient. On examining the half-breadth and body plans, the contrast between the forebodies of Mignonette, Columbine and Mr. Aylmer's cruising yawl will be at once seen, particularly between the first and last named, from which all hollow in the latter design is carefully eliminated from the forebody. With 7ft. beam, the yawl might have a little less rise of floor, an advantage in grounding without legs, which must always be anticipated and provided for in a cruising small craft, who may frequently require to ground in dry harbors, which larger vessels are afraid to attempt. As regards the rig, I cannot see any room for improvement; for the canvas, being divided into four working sails, is all easily handled. The mainsail is a powerful sail, and with the mizzen off, this yawl is practically possessed of the propelling power of a cutter with reefed mainsail; the pole mast is also an advantage, a topmast being better dispensed with in craft often sailed single-handed, and when a topsail is desired, it can be set flying on a pole, as shown at plate lxiv. in the sail plan. As a matter of practice, however, it is found that small craft go so well under the four working sails, or even under three—namely, mainsail, jib and jib-headed topsail—that the topsail is only exceptionally used. With a beam of 7ft. instead of 6ft. 6in., 2ft. 6in. width could be obtained between the sofas, less than which seems rather contracted. Supposing 6in. more beam were added to Mr. Percy Aylmer's yacht, some additional ballast would be requisite to put her down to the desired draft. A little lengthening of the lead keel, and less taper in its sectional form, would provide this: and I would suggest a little less camber of keel, as in dry harbors there is often a run felt, and occasionally a bore-tide occurs, under which circumstances a craft is inclined to pivot with a cambered keel in taking ground on the ebb, or floating with the flood. I should recommend an American elm bilge strake, 2¼in. thicker than the planking to extend two-thirds through the length of the yacht, which will almost give the strength of another keel, if the craft is grounded on her bilge by accident or design. The edges will, of course, be champered off to bring the seams right for caulking."

NEW YORK Y. C.—The first regular meeting of 1887 was held on Feb. 3, with Vice-Com. Haight in the chair. The officers elected were: Com., Elbridge T. Gerry; Vice-Com., Charles Coolidge Haight; Rear-Com., Frank C. Lawrence, Jr.; Sec., John H. Bird; Treas., F. W. J. Hurst; Fleet Surgeon, Morris J. Asch; Measurer, John Hyslop; Regatta Committee, Gouverneur Kortright, Alexander Taylor, Jr., and Stephen Peabody; House Committee, D. Henry Knowlton, Elijah A. Houghton, James N. Winslow, and Howard M. Durant; Committee on Admission, Chester Griswold, John S. Dickerson, Henry C. Ward, G. L. Haight and George L. Ingraham. The following members were also elected: S. Morris Pryor, John Cartlidge, Robert McCoskey Butt, Edward S. Wenwick, F. E. Day, H. C. Roome, L. Hopkin Smith, T. A. Bronson, Dr. F. H. Markoe, George B. Holt, William M. Singerly, Jordan L. Mott, Randolph Grymes, E. B. Havens, E. B. Underhill, Henry W. Eaton, Dr. Allen McLane Hamilton, William Gould Brokaw, William Arnold, George L. Seney, John M. Burt, E. S. Porter, S. L. Parish, Robert Underhill, Robert L. Crawford and William A. McL. Ilhaunsey. Lieut. William Henn and Capt. J. H. Merryman, U. S. Revenue Marine, were elected honorary members. The initiation fee was raised to $100, to take effect on Jan. 1, 1888. The America's Cup Committee submitted a report on the races of 1886.

THE GOELET CUPS.—Mr. Ogden Goelet has renewed his offer of two cups for this year according to the terms in the following letter:

NEW YORK, Feb. 4, 1887.

J. H. Bird, Esq., Secretary New York Yacht Club.

Dear Sir—In a letter received from my brother, Ogden Goelet, he desires me to offer for him the following prizes. One cup of $1,000, to be sailed for by schooners of the New York Yacht Club; one cup of $500, to be sailed for by sloops of the New York Yacht Club. These prizes to be competed for at Newport, R. I., on the same day during the month of August next. The day to be selected by the sailing officers. The course to be decided by the regatta committee. The race to be sailed under their jurisdiction according to the rules of the club, and with the time allowance as in races for the cups given by him in August, 1885-'86. Yachts shall have the right to enter up to 8 o'clock on the morning of the day of the race, and there shall be no limit as to the time in which race is to be made. Should a foreign yacht or foreign yachts be in our waters next summer, my brother begs to reserve the right to allow any one or all of such yachts to enter for this race should he so desire. Yours truly, ROBERT GOELET.

EASTERN Y. C.—The annual meeting was held on Feb. 8, and the following officers elected, Com. Hovey declining to serve again: Commodore, W. F. Weld; Vice-Commodore, J. Malcolm Forbes; Rear-Commodore, F. Gordon Dexter; Secretary, Edward Burgess; Treasurer, P. T. Jackson, Jr.; Measurer, Edward Burgess; Members of Council at Large, C. O. Foster and H. S. Hovey; Regatta Committee, Daniel Appleton, G. A. Goddard, H. C. Leeds and H. B. Jackson; House Committee, J. H. Sleeper, George H. Warren, B. W. Crowninshield, C. L. Tilden and Hugh Cochraue.

THE NEW STEEL YACHT.—The two sections of the keel have been received at City Island, and the frames are nearly all bent, but the stem, sternpost and plating are not yet on the ground. Mr. Piepgrass has the planking stripped from the Palmer, some new timbers and a new stem and sternpost, as well as the framing for the counter are in place. Beside her lies Cinderella, the work on her keel being now completed. Her topsides have been scraped and she will be painted white.

JULIA.—In a letter from the owner of the Julia, lately received in this city, he speaks in the highest terms of the new vessel. On her late run of 68 hours from Florida to Nassau she lay for a long time becalmed, with a heavy sea running, and her behavior under these trying conditions was most satisfactory. Later on a gale struck in from S. while she was crossing the Gulf Stream, and in her progress through it, on the wind, she made a fine showing of her weatherly qualities.

STEAM YACHTS FOR SALE.—Mr. Samuel Holmes, 120 and 122 Front street, N. Y., has lately issued a large list of steam vessels for sale or charter, including steam yachts of all classes.

PURITAN'S CUPS.—The Goelet Cup, won by Puritan in 1885, has been presented to the Eastern Y. C., to be held in trust and to be awarded each year to the yacht of the Eastern Y. C., making the best record on corrected time in the annual regatta. The cup presented by the N. Y. Y. C. in 1885, has also been presented to the E. Y. C., to hold in trust.

ALVA.—Mr. W. K. Vanderbilt's new steam yacht Alva arrived at New York on Feb. 7 after a very successful passage from her builders' yard at Wilmington. She left there on Saturday afternoon with her owner and his wife, accompanied by Messrs. D. M. Haight and J. F. Tams, and after adjusting her compasses came along easily. She will fit out at once for a cruise to the West Indies.

YACHTING NOTES.—Ariel, steam yacht, has been sold to go to Florida ... Lurline, steam yacht, has been out on the screw dock, prior to her departure on a Southern cruise.

THOUSANDS are born with a tendency to consumption. Such persons, if they value life, will not permit a cough or cold to become a fixture in the lungs and chest. The best known remedy for either is Hale's Honey of Horehound and Tar. PIKE'S TOOTHACHE DROPS cure in one minute.—*Adv.*

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

E. A. W., Boston, Mass.—You can get the cats of Reiche Bros.

M., Ottawa.—The address is S. Moreton Thomas, Cilgwin, Llangadock, South Wales.

G. F. D., Pennsylvania.—The Pennsylvania law was printed in our issue of Oct. 21, 1886.

I. L. G., Bay Ridge.—Guns are usually tested at a 30in. circle, 40yds. By variation of powder and shot you can determine best charge.

CHICAGO CAMPERS, Chicago, Ill.—Write to Geo. R. Merrell, New Boston, Ill. He will give you hints, and is moreover a steamboat man.

BLUE, Stoneham, Mass.—The book you quote gives the wrong pedigree. Blue Dan is by Dash III. and out of Opal (Rake—Fanny).

V. F., New Orleans—The size must be determined by the choke; or more accurately, use only such charge as will pass through the choke without too great compression.

A. M., Allentown, Pa.—I wish you would give me the size and color of the eyes of the snowy owl. Ans. Write to G. Wallace, No. 16 North William street, New York, for snowy owl's eyes.

F. C. M.—Put a wad in from muzzle down to point of constriction by the choke. Then chamber the shot on the wad, and having determined correct number use that layer in loading.

A. W. B.—You can procure the catalogues by writing to the rifle manufacturers and gun dealers, whose addresses you will find in our advertising columns. The arm you name will give satisfaction.

R. W. ALDRICH.—Baird's "Birds of North America" consists of two volumes quarto, one of text and one of plates. The atlas does not contain plates of all N. A. birds, but deals chiefly with those of the West.

NIPISSING, Boston.—Possibly some of the readers of your paper could give me some desired information in regard to the shooting on and about Lake Nipissing, Ontario, and whether there is good wood and black duck shooting there in September; also, whether the wild rice and celery are to be found growing in the lake, and what part of the same is most desirable for headquarters? Ans. See articles in issue May 6, 1886, and in present number.

WILD GOOSE.—While in Minnesota shooting last fall, I bought six wild geese which I used for decoys. A boy had hatched them under a hen, and raised them in a barnyard with their wings clipped. They are far tamer than the ordinary barnyard fowl. They are last spring's geese; three ganders and three geese. Will they mate or is it best to have but one gander with the geese as with the barnyard fowl? If they lay would it be better to put the eggs under hens or let them care for their own young? Ans. Probably your geese will not breed before they are three years old. They will pair and should be allowed to hatch and rear their young.

EXTRACT from letter received by the U. S. Cartridge Co., Lowell, Mass., from Mr. Frank Hart, of J. Hart & Co., bankers, Doylestown, Pa., dated Jan. 21, 1887: "I have about come to the conclusion that your .22 short rim-fire cartridges are the most reliable in the market, and they are beginning to be appreciated by those who know where a bullet ought to go when they pull the trigger." —*Adv.*

POT LUCK FROM EXCHANGES.

In conversation with a gentleman who passed through here a few days ago, he told me that on his way in he passed sixty wagons loaded with game. We will say that the average load of each wagon was ten deer. This is a small estimate, as many of the wagons had on four-horse loads. I do not wish to exaggerate—the truth is bad enough. Sixty wagons containing ten each would make a total of 600 deer hauled out of this county in one week. Nor is this all. It has been proven that this class of hunters wound and kill three times as many as they get. To load these sixty wagons 1,800 deer were slain. At the commencement of the hunting season, as a general thing, the weather is too warm for meat to keep, and the consequence is one-half the loads that are sent out are dumped beside the road. I have seen many loads hauled out of town and thrown away, because there was so much in the market people would not take it at any price. It is a self-evident fact that something should be done to stop this useless slaughter of our game.—*Routt County (Col.) Pilot.*

As this is the gunning season and stories of big game bags and gunning accidents, and intelligent hunting dogs are in order, it is but proper that we record the faithfulness and thorough training of Dr. Gilpin's setter dog "Sank," of the Gildersleeve strain: One day this week the Doctor had driven out from town, and with a friend was gunning in a swamp, some four miles from town. As the evening's shooting was drawing to an end at the close of the day, a last bird was pointed by the dog, and flushed; a shot was fired, but owing to the darkness and thick bushes, it was decided the bird had not been killed. The sportsmen then walked to the main road where their carriage had been left standing, leaving the dog in the branch where the bird had been shot at. By the time they had unhitched and team ready to drive the dog was at their side. It being then quite dark no particular attention was given to him except that he was noticed running beside the carriage as it was driven along. Upon reaching home the carriage was driven immediately to the stable within which was the dog's kennel. The dog was told to go into his box, which he did, and where he was found the next morning with the bird lying at his side. With the exception of having been divested of a considerable number of feathers it showed no injury received from the dog, who had kept pace with the carriage and carried it a distance of four miles and then guarded it over night.—*Middletown (Del.) Transcript.*

LIGHTHOUSES AND WILDFOWL.—Mr. Herbert B. Bradley, a veteran sportsman of New Haven, was at the Astor House last night on his way home, having concluded a successful winter duck-hunting expedition to Montauk Point in company with Messrs. Henry L. Sperry and Willard Eakin, of Brooklyn. The men took good bags of fowl during the daily flights of the birds from the ponds and inlets with which the eastern end of Long Island is studded. "But the thing that impressed me most," said Mr. Bradley, "was the wholesale slaughter of wildfowl by the lantern at the light in thick weather. I had often heard it spoken of and had read of it in the papers, but I never supposed it to amount to much. On two occasions while we were there, once on a foggy night and once during a snow storm, there was, I should judge, a small cart load of fowl killed by flying against the lantern. The ground at the foot of the light was literally covered with the birds and blood and feathers. The people living there said it was occasioned by the birds' bewilderment in the thick atmosphere. When in this condition they come upon the light, it seems to dazzle them and they fly directly into it and are killed."—*N. Y. Commercial Advertiser.*

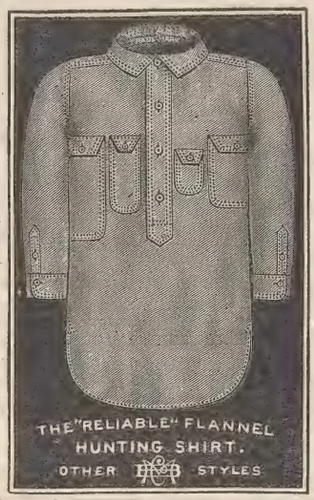
EUROPEAN PLAN



MESSENGER, Proprietor.

QUAIL SHOOTING.

The undersigned have leased the well-known Bellevue Hotel at High Point, N. C., and can offer to visiting sportsmen unsurpassed quail shooting. We have leased the shooting privileges over a large extent of excellent and well-stocked ground, much of it never having been shot over. We can furnish good dogs and competent guides if desired. Quail are unusually plenty this season, and from now to the close of the open season, April 1, is the best time for shooting. The hotel accommodations are excellent, and good livery service can always be secured. For farther information address

The Forest Waters the Farm;

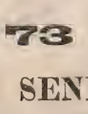
OR,

The Value of Woodlands as Reservoirs.

BEING THE LES ÉTUDES DE MAITRE PIERRE SUR L'AGRICULTURE ET LES FORETS.

PAR M. ANTONIN ROUSSET.

Translated by



REV. S. W. POWELL.

The introduction reviews the extraordinary movement of torrent taming in France, in preparing public sentiment for which the Studies of Master Peter played a noteworthy part. The book was written as a sort of science primer, setting forth the first principles of the relations existing between woodlands and agriculture. The principles and reasoning are not less applicable to the United States to-day than to France then.

Price in cloth, 75 cts.; paper, 50 cts.

FOREST AND STREAM PUBLISHING CO.,

39 Park Row, New York.

PRINT Your Own CARDS Press $3. Circular size $8. Newspaper size $44. Type setting easy; printed directions. Send 2 stamps for catalogue presses, type, cards, etc., to factory. KELSEY & CO., Meriden, Conn.

SCREW PLATES, TAPS, DIES, ETC., FOR gunsmiths and amateurs. Send for illustrated catalogue to S. W. CARD & CO., Mansfield, Mass.

EVERYTHING THAT IS NEW IN SEEDS is offered and described in our CATALOGUE No. 280, which this year we send out in an illuminated cover. The Catalogue is replete with new engravings of the choicest flowers and vegetables, many of which can only be obtained from us; and contains, besides, 2 beautiful colored plates, and very full instructions on all garden work. Altogether it is the best ever offered by us, and, we believe, is the most complete publication of its kind ever issued. Mailed on receipt of 10 cents (in stamps), which may be deducted from first order. Please be sure to order Catalogue by the number.

IN PLANTS

PETER HENDERSON & CO. 35 & 37 Cortlandt St., NEW YORK.

Canoe and Camp Cookery.

By "SENECA."

A practical cook book for canoeists, Corinthian sailors and outers. Practical because the author gives explicit and intelligible directions for preparing such dishes as he has himself actually tested in camp and on a cruise. This is just where the recipes differ from the absurdly impracticable dishes given in some so-called camp cookery books. The cooking outfit is described, and numerous hints on camp economy add to the value of the work. Cloth, 96 pages Price $1.00.

NEW YORK: FOREST AND STREAM PUBLISHING CO., 39 Park Row.

A WORD IN SEASON.

Readers old and new of the FOREST AND STREAM may be pleased to know that the paper is now at the close of 1886 enjoying the support of a wider circle of friends than at any former period in its history. This is an interesting fact, for it proves, with the best possible demonstration of success, the sound sense of the theory long ago adopted by editors and publishers, and steadfastly adhered to, that there is room in this country for a journal treating the subjects embraced by our departments, and depending for its support wholly upon what have been accepted by the conductors of the FOREST AND STREAM as legitimate journalistic methods. In other words, we have kept faith with subscribers by devoting our reading columns exclusively to honest reading matter, and have not given up our pages to extended paid puffs of railroad routes clumsily disguised as accounts of sportsmen's travel, nor alluring descriptions of wonderful agricultural regions, all paid by the column. The conviction that a sportsman's journal for sportsmen could be conducted without resorting to such questionable makeshift expedients have proved quite correct.

The tone and high character of the journal, as one fit for sportsmen to receive into their homes, will be jealously maintained. As there is nothing in the recreations of field and stream inconsistent with the highest type of manhood, so, the editors are convinced, there should be in a journal like the FOREST AND STREAM nothing to offend good taste.

The FOREST AND STREAM will be, in the future as in the past, thoroughly representative of the best field sportsmanship of America. It will maintain its position as the chosen exponent of those who seek recreation with gun or rod, rifle, canoe or yacht. Its character will be scrupulously preserved, and readers in 1887 may expect a rich fund of sporting sketches and stories, suggestions, bright sayings, prompt, reliable news, and interesting discussions. Angler, shooter, dog breeder, canoeist and yachtsman, may be assured that whatever is of interest in these respective fields in 1887 will find its way into the columns of the FOREST AND STREAM.

The Sportsman Tourist

columns are filled with bright sketches of travel, camp life and adventure, the reflected experience of a host of outers.

Natural History.

Papers descriptive of bird life, chapters of animal biography, notes on the ways of field, forest and water creatures as observed by sportmen, anglers and naturalists, make up these pages. The special work of the past year has been the establishment of the Audubon Society for the Protection of Birds, begun in February, and having now a membership approaching 20,000.

Angling and Shooting.

Time was when a single journal sufficed in this country for adequate discussion of all the heterogenous pastimes and practices dubbed sport. That time has long since passed away Some of the sports have been outgrown or put under a ban, others have developed to such a degree that each class requires a special organ. The particular fields chosen by the FOREST AND STREAM are those of angling and shooting. The pages given up to these topics are rich with the freshest, brightest, most wholesome, entertaining and valuable open air literature of the day. They have the sunlight and woodsy odor of the haunts of game and fish; they picture nature as seen by sportsman and angler. One has not long to read the FOREST AND STREAM before learning its attitude with respect to game and fish protection. The editors believe in conserving, by all legitimate methods, the game of fields and woods, and the fish of brook, river and lake, not for the exclusive benefit of any class or classes, but for the public. They are earnest, consistent and determined advocates of strict protection in the legal close season, and in restricting the taking of game both as to season and methods, so that the benefits of these natural resources may be evenly distributed.

The Kennel.

This department has kept even pace with the growth of the interest of breeding field and pet dogs. Reports of trials and shows are usually given in the FOREST AND STREAM in advance of other publications, and being prepared by competent writers their intelligent criticisms are of practical utility. This journal is not hampered by personal animosities. It has no judges to "kill." It does not decide a dog's merit by asking who the owner is. It treats all kennel subjects without fear, favor or ulterior motives, and in consequence enjoys a degree of public confidence and esteem denied to such as stagger beneath the incubus of malice and flounder in the bogs of ignorance.

Rifle and Trap Shooting

records scores of meetings and matches, discussions of topics pertaining to the butt, gallery and trap. Secretaries of gun and rifle clubs are invited to send their scores for publication.

Canoeing.

This country is a land of magnificent water courses, and Americans are just beginning to appreciate the canoe as a means of enjoying the delectable charms of river and lake, and bay and canal. The men who are making fortunes by making canoes know best how rapidly the ranks of canoeists are multiplying. Novices and old hands will find in the FOREST AND STREAM canoeing columns, in charge of a practical canoeist, accounts of cruises, lines of new craft, and hints and helps and suggestions without number. Closely allied is

Yachting,

in which the FOREST AND STREAM is the only competent, all-the-year-round, intelligent exponent. Our reports of races are full, prompt and accurate. The numerous illustrations of lines of new yachts make an invaluable record of the development of yacht building.

Weekly, $4 per year; $2 for six months.

Forest and Stream Pub. Co., 39 Park Row.

Wanted.

The Kennel.

Grand Bon-Secours Kennels.

Near Péruwelz (Hainault), Belgium.

Established in 1865.

Property of Mr. Aug. Tondreau Loiseau,
Banker at Péruwelz.

These kennels enjoy a wide-spread fame, and hundreds of sportsmen of the highest authority in the doggy world can bear witness to the scrupulous good faith which governs their operations, and the remarkable merit of many of the dogs which have gone out from them since 1865. The collection consists exclusively of English sporting dogs. Besides a splendid collection of English stud and field dogs—Laverack, Gordon and Irish setters, large and small pointers, Clumber, Sussex, Norfolk and black spaniels, large curly or wavy-coated retrievers, all of the most noted blood—which are employed for breeding and whose young are offered to the public, these kennels always have for sale a large number of other English dogs, warranted to be of pure and noble blood, handsome and good, of full pedigree, thoroughly trained to obey, to charge at the uplifted hand, and to retrieve perfectly all kinds of game.

The kennels are constantly open to visitors.

Adult and trained dogs can be shipped at Antwerp (Belgium) destined for the principal ports of the two Americas.

Great Dane Pups.

I will sell the very choice pair of Great Danes, **Thyrus II.** (A.K.R.) and **Nina** (A.K.R.), whelped Sept. 20, solid light tan color and light mode, with darker mode spots. Weigh now 65 and 55lbs., 5ft. long, 24in. high, very large frames, fine heads and eyes. *A pair of great beauties, bright, active, intelligent, very affectionate and gentle,* quite well trained, follow finely together; *can not be equalled as thoroughbred watch and house dogs,* or as an ornament for a gentleman's grounds. Their sire is imported Thyrus, one of the finest Great Danes in America. Photographs 25 cts. Will sell this pair for $100.
J. L. WINCHELL,
Fair Haven, Vt.

Great Bargains in St. Bernards.

We offer for sale at the following extraordinary low figures the following Swiss St. Bernards:

Rough-coats, stud dogs: Barry I., Hadjar and Alvier at $200, $175, $175. Tromba, young bitch (had a litter of 9, 7 dogs, by Eiger, in Dec.), $175.

ANSWERS TO CORRESPONDENTS.

CAN THEY HOODWINK THE HOUSE?

THEY are trying to very hard. But will they succeed? A good many people thought last December that the project for running a railroad through the Yellowstone Park had, under the opposing leadership of Mr. Cox, been finally defeated. That is where the public failed to do the railroad gang justice. After having been crushed under a vote of 170 to 65, the railroaders gathered up their flattened forces, and retired into their holes to wait. Their opportunity has come again, and they are plotting fresh schemes.

Judge Payson of Illinois is still their leader, and as he is a member of the Public Lands Committee he has a fine opportunity for helping his co-conspirators, and for injuring the National Park. Such an opportunity he is not going to let pass him. Judge Payson is no such man. Although he has been in the National Park, knows what it needs, and knows that the public demands that it shall be protected, he cares little for Park or public when the question of the dollar comes up.

We understand that he has so manipulated matters in the Committee on Public Lands that an amendment has been added to the bill, making the Yellowstone River, East Fork and Soda Butte Creek the northern boundary of a portion of the Park. This cuts off from the reservation an extensive strip of territory, throws open to occupancy a number of natural wonders, of which Soda Butte and Soda Butte Springs are the most important, and—here come in the railroaders—opens to any corporation a way for a railroad up the Yellowstone, East Fork and Soda Butte Creek to the Clark's Fork mines.

The strip thus cut off from the Park contains a great body of timber, which protects the waters of tributaries flowing into the Yellowstone from the north; it is an important range for game. Elk are found there, so are a few mountain sheep, so are the most of the few buffalo yet remaining in the West. To cut off this strip is to pollute with sawdust the waters of the Yellowstone from the mouth of the East Fork down; to strip the mountains on the northeast side of that river of their timber, and turn them into barren, desolate wastes of volcanic rock; to destroy a considerable part of the game which still remains in what was once the greatest game country in all the West.

This is a cunning dodge on the part of the railroad gang under Judge Payson's leadership to pull the wool over the eyes of the House of Representatives, and to obtain by trick and device what the House squarely and flatly refused to grant them when they asked for it in an honest and open manner. Will the railroad gang succeed in getting what they want? Will the House in all simplicity pass the bill as amended, and turn over to the railroad many times more than the railroad asked for when the request was refused? Or will some one be found in the House with intelligence enough to fathom the deep game of these astute land grabbers and to expose their plots?

The public desires the passage of the Park bill as it came from the Senate, and sooner or later its demand must be granted; but the public is not ready to have a large section of its Park taken, just to please a band of schemers like the Hobarts championed by Judge Payson.

Two years ago a condition of things nearly similar to that now existing prevailed. The House passed a Park bill containing this same amendment, but that bill failed in conference committee just at the end of the session. This amended bill, if it should pass the House, will go to the conference committee, where it will be likely to meet the fate of its predecessor. The amendment is a piece of barefaced robbery, added to the bill for no other purpose than that of cheating the House into giving what has been already refused. It will benefit no one but the railroad gang. It will be a serious injury to the whole public. It is as shameful a piece of covert special legislation as has been introduced into any bill in a long time. If the House understands the purpose of this amendment, it will kill it with great promptitude.

The railroad gang show their usual shrewdness in using the bill advocated by the friends of the Park as a catspaw to draw out their own chestnuts. It is the old cry, "If you don't give us our railroad we'll bust the Park."

Will the House, after having taken the stand it has, let them "bust the Park?" We hope not.

SNAP SHOTS.

THE many Americans who, on the occasion of angling and hunting excursions to Canada, have tested the ever ready and never failing courtesy of Mr. J. U. Gregory, Chief of the Bureau of the Ministry of Marine, at Quebec, will learn with pleasure that his collected sketches have just been published in book form. The title is "Recits de Voyages en Floride, au Labrador, et sur le Fleuve Saint Laurent" (Accounts of Travel in Florida, Labrador and on the St. Lawrence River). Many of these papers appeared originally in the FOREST AND STREAM, whence they have been translated into French for the present volume, to find a new circle of readers as they deserve. Mr. Gregory is an accomplished angler, a master of woodcraft, a quick and intelligent observer and a traveler who keeps both eyes open. He has enjoyed unusual opportunities to explore out of the way nooks and corners and observe various interesting phases of life. His book is a valuable addition to the already extensive literature of Canadian life and travel.

Land owners in certain parts of Long Island, having tried every other means of protecting the birds, have at last come to the conclusion that the only effective means of accomplishing this is by posting their land. This course is being so generally adopted and so strongly recommended by the local papers that it seems likely that next autumn strangers who go there to shoot will see trespass boards staring them in the face all over good old Suffolk county. The land owners are not only doing this, but they are trying to care for the birds in winter by feeding them and putting up shelters for them. All this is good for the birds and good for the farmer. There seems no reason why the latter should not derive some profit from the birds reared on his farm. He does from the sheep, the chickens and the ducks, why not from the quail?

A New York genius claims to have invented a batten for a canoe sail. The sail batten has been employed by the Chinese for centuries, and some years ago the device was copied and used in England, whence it came to this country and many canoes have been fitted with it. The "inventor" now comes on canoeists to pay him a royalty. This is something like the rawhide-backed bow "invention." That style of bow had been in use by American Indians and Eskimos for no one knows how long, but when the archery craze was in full blast a shrewd Yankee who had traveled among the Indians "invented" the rawhide bow and made money out of it. When the archery fever was over this same genius let his hair grow, cultivated a venerable appearance and went into the manufacture of "magnetic" garments warranted to cure every time.

"Capt." Cloudman, who has gained some degree of notoriety by his misadventures with the yacht Outing, in which he set out ostensibly to circumnavigate the globe, appears from all accounts to have been a land-lubber of aggravated type. He is said not to have known starboard from port, nor the jib from gafftopsail, while the soundings on the chart were incomprehensible mysteries. It is no wonder that in such lubberly hands the yacht went ashore full tilt on Jupiter Inlet; and that the "Capt." himself was not drowned must have been due to extraordinary exertions by the sweet little cherub who sits up aloft and mistook Cloudman for an actual sailor man.

Herostratus, "the fool who fired the temple of Ephesus," has been infamous for 2,000 years; but the name of the man who introduced the English sparrow pest into this country is already a subject of dispute. Another candidate for fame is the enterprising gentleman who proposes to bring live rabbits from Australia to the United States. The peril attendant upon the introduction of such pests has already been pointed out in these columns. One game importing "crank" can bring upon this land a nuisance beyond the ken of this generation to cope with. The time to stop importing foreign species of hares and rabbits is before it is begun.

The proposed amendments to the New York game law sent to Albany by the New York Fish and Game Protective Association are a combination of good and bad. The change in the woodcock season, by which July will be an open month, is a grave mistake, a retrograde step, and directly in opposition to the general and approved efforts now making in several States to abolish all summer shooting. This amendment should not be permitted to pass. Other points of the bill will be considered when we have its full provisions.

Memorials praying for the passage of the National Park bill (S. 2436) have been adressed to the House of Representatives by the American Humane Association, Linnean Society, the Mystic Anglers, St. Augustine (Fla.) Gun Club, Megantic Fish and Game Club, of Boston, Kalamazoo (Mich.) Gun Club, Valley City (East Saginaw, Mich.) Gun Club, National Gun Association, Amateur Sporting (Wellsville, O.) Club, and a number of others.

All sorts of folks go shooting, among them practical jokers. One of these creatures was with a Beverly, Mass., hunting party recently, and on the way home rushed ahead to the wife of another of the party and as a joke told her that her husband had been shot. The woman fainted, remained unconscious for a long time and on recovery was insane. There is no moral to this. Practical jokers will joke to the end of the world; their race is tenacious as that of the didn't-know-it-was-loaded idiots.

The people of Georgia are becoming interested in the protection of game in that State. They have in existence local laws for nearly one-half of the counties, and at the recent session of the Legislature a very stringent law was passed for several other counties. The new law has been approved by the Governor, and considerably curtails the open season on all game and makes the penalty very heavy for violations of the law.

Paul, a restaurant proprietor, of this city, successfully finished his task of eating two quail per day for forty-one days, last Monday. It is said that $10,000 changed hands on the result. This is the second time under game protector Godwin's regime that a public quail-eating task has been accomplished in close time without molestation.

Capt. Nathaniel Clock, of the Mischief, died at his home in Islip last Tuesday. Capt. Clock was one of the most expert and famous yacht skippers of America, having commanded the White Cap, Vixen, Magic (when she beat Comet), Madcap and Mischief (in which he beat Atalanta).

No less than eighteen bills have been introduced to repeal the Arkansas game law. Public sentiment sustains the law.

Abolish spring and summer shooting.

UNOFFICIAL LOG OF THE STELLA.—III.

READER, should you ever have occasion to visit Jekyl Island (near Brunswick, Ga.), do not forget to call on old man Du Bignon, who lives in an old-fashioned cottage about one mile from the club house. The house is small, decidedly Southern in build and surroundings, a good deal run to seed, but surrounded by the finest live oaks on the island; and underneath these oaks you will not fail to notice all that rust has left of an immense square iron cauldron. This is historical. It is the cauldron in which beef was boiled and soup was daily made for the sable cargo of the Wanderer; and when the cargo was safely landed the cauldron was set up ashore and kept in daily use until the cargo was disposed of and dispersed to the various plantations along the coast. And from that time until the present the huge silent witness has slowly rusted away under the oaks of Jekyl Island.

No man can give the history of this island and the famous daring venture of the law-defying Wanderer as can old man Du Bignon. It was to him that the cargo of human chattels was consigned. It was owing to his vigilance and thorough knowledge of the country that the Government was unable to lay hands on a single negro of that cargo, of which he had the disposal, and he succeeded in placing the stock where it was supposed to do most good. In those days the Du Bignons lived in (Southern) baronial style. They owned Jekyl Island, and dealt largely in "niggers" and Sea Island cotton—two articles that paid princely returns.

Latitude and longitude considered they were a fine race of men. Of fine physique, energetic, brave, courteous and just, as they believed in their hearts, they were yet intolerant, ultra Southern, and bitterly pro-slavery. The Sea Islands at that time offered few inducements to the average Bostonian as a winter residence, and it was a sickly country for Yankee peddlers. The war changed all that. There was not a slave or a pound of cotton on Jekyl Island, and the Du Bignons were in a state of needy decadence until a lucky sale of the island gave them the command of money once more. We had a young man of the name for guide and director on a deer hunt, and a finer specimen of young manhood or a better horseman would be far to seek.

Old man Du Bignon is in the sere and yellow, and an ugly cancer is eating out the little life he has left, but he is not averse to talk, and he will give you a clearer inside view of old-time life in the Sea Islands than you will ever glean from Uncle Tom's Cabin or Whittier's poems, added to all the files of the *Liberator*. He has no lack of children to cheer him in his old age, there being some fifty on the island and in the neighborhood who claim him as father. They are mostly coffee-colored, and the straightforward old sinner, whose morality is not of the Plymouth Rock type, has no compunctions about it.

We find many yachts from the North cruising in Southern waters, and the general disposition to fraternize, exchange visits, or afford mutual assistance, is one of the pleasant features of yachting. We meet and pass them, or they pass us in the most unexpected places. In narrow creeks, in bays, sounds and rivers, or we come to anchor in the same waters and "gam" with them.

In Jekyl Creek we were anchored near the Magnolia and the Reva, and when we ran up to Brunswick we found them both there before us; and the latter yacht was in difficulty, having lost her second engineer, who had been shot by a Brunswick policeman. The citizens were bitter on the policeman and declared the act no less than murderous. "And what makes it look blacker," said a leading merchant of the place, "is the fact that this is the seventh man that same policeman has shot. He will get 'stopped' on this shot." We see by the Florida papers that the wounded man has died and his slayer is in prison on a charge of manslaughter. It is bad policy for Florida ports to thin out yachtsmen by pistol practice, and the people see it. Yachtsmen buy liberally and pay well for what they require.

We meet some queer craft in these waters, and one of the most curious is a New Haven sharpie, which started from New Haven with a crew of nine men some time in November, bound for St. Lucie, on the Indian River. She was expected to make the trip inside of a month, as she was propelled by a kerosene engine in addition to her cat rig. An open boat, with less than a foot of freeboard and no cabin at all, nor even a small boat to go ashore with, her only protection for the crew at night or in stormy weather consisting of tarpaulins and blankets stretched over the boom, she was by no means the craft to run outside, while comfort and cleanliness were out of the question. Seven weeks out she passed us in Jekyl Creek, puffing and roaring as kerosene boats will, and with a crew of seven, two men having left her in disgust.

We ran outside to Fernandina, and lay there for one day, then took the outside run to St. Augustine, where we spent several days; and while lying at anchor there what should come puffing up the bay but our kerosene friend from New Haven. We had supposed her at St. Lucie, but she had been working the inside route without a pilot, and had got a trifle mixed. At Matanzas Inlet she had ventured outside for a run to Mosquito Inlet, but hardly had got out on the open sea when there came an ominous change in the weather. The wind was ahead and fast rising, the clouds rolled up black and threatening, and the sharpie turned her nose up the coast and made her best speed for a harbor at St. Augustine. She made it by a close shave, with nothing to spare. An hour's delay would have swamped her. She tied to the wharf over night, left early the next morning, and we supposed we had seen the last of her. Not at all. We loitered along the coast—always outside—and while lying at anchor near the little town of New Smyrna, along came our friends from New Haven. They had worked through by the inside route, slowly and with some difficulty, and had been nine weeks *en voyage*, whereas they expected to make the trip in a month. They were in a demoralized state, rather. An open boat, with a kerosene engine and plenty of salt water, does not give the right conditions for wholesome cookery or cleanliness, and they were badly mixed. The boat was destined for the oyster trade on Indian River; and six of her crew were engaged to work for "the company," being given free passage on the boat on condition that they furnished and cooked their own food. The only man under pay was the captain, the pay of the others commencing on their arrival at St. Lucie; and they had rather anticipated a sort of free and easy picnic. But the cruise had not panned out according to promise.

"If," said one of the crew, "there is such a thing as a tramp element in yachting, we represent it. We live like pigs, there is only thirty-six cents among six of us, and we are out of tobacco. Thank heaven we are only three days easy run from St. Lucie, and if I am ever caught cruising from Connecticut to Florida in an open boat again, I hope I may drown."

The Stella's crew stocked them with tobacco, and they are at the end of their weary cruise ere this. But an old woodsman may be pardoned a hearty laugh at the comical ending of such a lugubrious picnic.

Every intelligent reader is supposed to know something of "Old St. Augustine," the oldest city in America, and, perhaps, the most written about. And so many have read descriptions of the massive old Spanish fort—now Fort Marion, that description here might be deemed superfluous.

But everybody has not seen Chief Geronimo's band of 448 Apaches now confined in the old fort, though Geronimo has been sent to Fort Pickens, as it was thought best to keep him apart from his tribe. They are camped in 147 tents, nearly all of which are pitched on the broad walks of the fort; and if there is a dirtier tribe of Indians anywhere on this continent I have not seen them.

As Captain H. had letters to the officer in charge of the post (General Ayers), we had no difficulty in getting a pass, and a sergeant who has been with the band since their surrender, and can speak their lingo, was detailed to put us through. We were warned that it would be as well to keep anything in the way of watch chains and ornaments out of sight, as they are a freehanded lot of beggars and do not stand in much awe of the white man, whom they have been trained from infancy to look upon as legitimate plunder.

We found them enjoying rather more than the usual aboriginal amount of dirt and coarse paint, the latter put on in thick daubs of what looked like red and yellow daubs of plaster of paris. A few of them were clad in Apache costume, which looked picturesque rather than cleanly, but the larger portion of them wore the cast-off toggery of civilization, and the various ways in which they wore it passes description. Many of the boys had bows and arrows, with which they had already learned the Indian begging trick of shooting pennies or nickles from a cleft stick. "Where do they get the timber to make their bows?" the sergeant was asked. And he answered laconically, "Wood-pile." There are 147 men and boys in the band, while the women and children number 301. Youngsters under six years of age were especially numerous, and the Indian women are exceedingly fond of their children, whom they manage with admirable tact and gentleness. It seemed to us that this was their one redeeming trait.

As to the tribe generally, they chafe grievously at their unwonted abridgment of liberty; and the officers at the fort believe they are only kept from a wild outbreak by the understanding that they are to be put on a reservation of their own in early spring, and left free to do as they please.

In spite of all reports to the contrary these Apaches are and have been exceptionally healthy in their captivity, there having been but seventeen deaths among them since their surrender. But, accustomed as they have always been to the freest life and the pure mountain air of their native fastnesses, it is likely the low, malarious lands of southern Florida may soon solve the Indian question so far as they are concerned, and it is as well so. Humanity has no use for them.

NESSMUK.

A TRIP FOR BOB WHITE.

BY agreement, my brother, who lives not far from Little Rock, Arkansas, and myself met at the Exchange Hotel, in Richmond, Virginia, on Dec. 3 last, on our way to visit relations in the county of Goochland. Among the inducements to take this trip was an assurance on the part of "M., of Northside," that in addition to all the pleasures which his house could afford, he could show us a great many coveys of Bob Whites, and give us an opportunity of displaying our skill with our fine guns. He of Arkansas had with him his gun with two pairs of barrels, each 12-bore, and I had a hammerless 14-gauge, and a second gun, which I have called in honor of the donor Lucy Green. He supplied himself with loaded shells from a dealer in Richmond, while I, using an uncommon size, took with me about 200, charged according to my own notion of what was right.

Soon after leaving home on the Thursday night preceding, I discovered that Boreas or somebody else had plunged his javelin in one of the mountains near the North Pole, and the frigid winds had greatly lowered the thermometrical elevation. When I reached Weldon the air was freezingly cold, and so it continued all the way to Richmond. After a rather unpleasant night spent in a cold room, we took the Richmond & Alleghany Railroad. It had been cloudy since sunrise, and the train had not gone more than seven or eight miles before the snowfalls were descending rapidly. When we arrived at our station, the ground was covered with a white mantle, destroying all hope of our indulging in any of the pleasures of the field that afternoon. Our friend "M., of Northside," (I do not comprehend the reasons for his *nom de plume*), was on hand with his vehicle. Reaching his portals we were welcomed by his lovely wife, who, "though the storm without might roar and rustle," was blooming like a violet, and charmed us by her cordial welcome. A glowing fire cheered us with its heat and protected us from the fury of the driving snow. It was then a little past midday, and for hours the snow was falling. The next morning there seemed to be no abatement, and when it did stop the ground was covered about eight inches. This saved Bob White from any possible molestation by our guns, and ended all hope of any sport in the county of Goochland. Still we passed the time pleasantly in conversation and otherwise. We not only enjoyed ourselves at the dwelling of our host and hostess, but braved the weather and were the recipients of kindness in the homes of some of the neighbors. Indeed, a gentleman, once a resident of New York, but now occupying a lovely seat upon the James, although past his "three score years and ten," waded through the snow to call on us and invite us to dine with him. We accepted his offer and were met with a "kindly welcome."

But we did no hunting in Goochland. Thursday morning we took the cars to Richmond. The streets of that city were a sight. Dirty snow for several inches in depth covered the paving stones: the sidewalks were slippery and not safe for sober and well-balanced men. From here we set out on the Chesapeake & Ohio R. R., and going rapidly forward, snow, snow on every side, until the train drew up at Frederick's Hall, and before a great while we alighted at the hospitable home of Dr. L. S. P., and were ushered into a nice parlor, warmed by a blazing fire of oak logs. Mrs. P. soon came in and made all things "more cheerful and more bright" by her friendly greeting. There being no "heritages of the Lord" at this place, the doctor and she "who caught his youthful fancy" make pets of beagles and setters, and devote much time to the gentle art of fishculture. The madame seems to take great interest in her husband's hobbies—if I may so speak—and is of great assistance to him in the management of his kennel. They had some fine specimens of the dogs which I have named, and allowed them to take the "freedom of the city." Among them were a pair of splendid setter pups which they had raised, and meant as a present to my brother. He dubbed them Lew and Nan in compliment to the givers.

Directly after dark our friend M. made his appearance, and we had a pleasant time, talking of dogs, guns, ducks, Bob White, sage hens, willow grouse, speckled trout, black-tailed deer and elks. My brother has spent more than a month for each of the past several years in the mountains of Colorado enjoying himself with the rough sport which that locality affords, and entertained us all with his narration of "the uncos that he saw and heard" in that mountainous land. On the following morning the snow still covered the earth, but M. and the Doctor concluded that they would take their guns and go out in quest either of Bob White, ruffed grouse, or wild turkeys. My brother and I showed more wisdom by remaining in the house. When they returned they had four squirrels, and reported that they had seen signs of grouse and turkeys. The next day, "listening to their enticing voices," I was induced to go with them. In that there was folly. I walked a half mile from the house, saw nothing, and did "the better part" by toiling back to the place whose comfort I had left. The others went on. They returned with no game, but M. reported that he had shot at a gobbler.

That night we left the hospitable dwelling with pleasant recollections of its occupants, and all of us took the eastern bound train—my brother to his home in Arkansas, M. to Louisa Court House on professional business, and I went where I was met by my kinsman W. J. L., who escorted me to his home. And here I received the warm welcome which had been my lot on two former occasions—one of which was when I visited the place at the invitation of some young friends, students of Randolph Macon College, which is located here, to deliver an address before the society of which I was a member "in life's morning march, when my bosom was young." I spent a quiet Sunday, conversing with the family and with Professor B. who did me the honor to call.

After dinner the following day, when I was listening to the interesting conversation of Col. J. M. P., Prof. S. of the College made his appearance. To my great surprise, he informed me that he had seen posted upon the trees in the campus that —— was in Ashland, and would meet the members of Washington Hall at 5 P. M. Soon thereafter a committee came down and formally invited me to accompany them. I did not resist the appeal, and soon entered the Hall. It rapidly filled with the boys, and then I was introduced to their acquaintance by Professor S., of Connecticut. They wanted a speech—and they got one. I commenced on a high key with the words "*Non in hæc fœdera veni*," and proceeded to "rousticate," to the best of my skill, on whatever subject came into my mind. I do not know what I said. It might have been tolerably good, somewhat indifferent or very bad, but it took. College boys make an appreciative audience. They are easy to satisfy, they applaud vociferously. After months of hard study, trying to master Cæsar or Horace, or to unlock the mysteries of Taylor's or McLaurin's theories, anything is a relief, and they welcome the arrival among them of a stranger who can stand up and talk. The boys enjoyed my speech, and I enjoyed their enjoyment. But speaking is not my business now; "Othello's occupation's gone." I look after spindles and looms and cotton, and am, as some people say, a laboring man. When I was otherwise engaged I loved to talk to boys—to college boys—and tell them some things, partly jocular and partly serious, with the view of pleasing and benefitting them. They always welcome me, and I really think that a few days before the commencement at —— the bulk of the students at that institution are quite as much pleased to hear that I would be in the chapel at morning prayers as they would be to hear that John Robinson's or some other circus had arrived with a full supply of acrobats, horses and clowns. Well, hurrah for the boys!

Perhaps some one may ask me where I will begin to describe my hunt. I answer, not in this communication. There was no hunt at all. I was ready, but the land was not visible. It was hidden from my vision. I did not see it. No doubt there was land somewhere, but it was out of sight. My little gun was admired by everybody because of its looks. They all thought it was capable of doing its part. And so it was, but it did not perform.

Leaving my generous friends on Tuesday morning, I was soon in Richmond and that night at 7 o'clock I was in Raleigh, the guest at the house of one of North Carolina's noblemen, a gentleman well known to intelligent men throughout the country, as one who is honest in all his dealings and capable of discharging any trust with which he may be invested. He and I have long known each other and both have tried to "do the State some service." He has succeeded. At present he occupies one of the highest standings which the people can confer. We discussed matters of private business and some subjects which pertain to the public. The following day my duties called me to visit one of the public institutions and to assist somewhat in its management. The next day there was a similar demand and at night I was on the train, bound for home.

I do not regret my trip. It was an enjoyable one. There was no hunting, it is true, but then I had pleasure. I met with kind and hospitable people. If I had been

accompanied by my friend Mud, as I had hoped, he would have contributed largely to our joys, and added much to the enjoyment of those whom I visited. They had heard of Mud, for I had immortalized him through the columns of the FOREST AND STREAM. He deserved it all.

We have had bad weather in North Carolina. Just as I was fully ready to try the birds, down came the snow and ended all my joyous anticipations. At this season they fly fast, and the sportsman has no time to count ten after they spring up from their cover and seek another. He must be "quick on trigger" or they get beyond range.

I see that you have another "Wells." Which of us has the prior right? If he, then I will take another name. Otherwise, will he? But for the present I will subscribe myself WELLS.

ROCKINGHAM, N. C., Jan. 13.

SAM LOVEL'S THANKSGIVING.—II.

AS hunting was dearer to Sam Lovel than feasting, it very naturally happened that on a certain Thanksgiving Day morning he was out on the hills with Drive rather than at home enduring the fuss and bustle of the "women folkses'" preparation of the great dinner. Such endurance he thought would be poorly paid for by all the good things that the feast would furnish forth, to be gorged at noon in a silent and business-like manner, as if to eat a little more than one's comfortable fill was the best, if not the only observance of the time-honored holiday that was required.

Sam was out betimes. As he took his way across the narrow fields to the woods, the dun grass land, the black squares and oblongs of fall plowing, the gray of the deciduous trees and the "black growth" of the woodlands were blurred together in the first light of the early morning, nothing distinct but lines and patches of the first snow, left by the ensuing warm days, and the serrated crest of the mountain now sharply cut against the eastern sky. The hound, quartering the way toward sunrise, came into sight and vanished, now to the right, now to the left, first white spots and then a dimly defined dog, then white spots and no dog, nor any indication of his nearness but his loud snuffing and crisp crush of the frosty herbage under his feet. Presently he gave tongue on a cold scent, and puzzling out with his miraculous gift of smell the devious course of the fox over knolls and through swales of matted mouse-haunted wild grass, and by and by, when daylight had set well-defined bounds to field and forest, led his slowly-following master to the ridge of the first hill. Then the sun began to burn its way up the sky with so intense a flame that it seemed to be consuming the stubby trunks and low-spread branches of the stunted evergreens bristling in blurred silhouette on the mountain crest. Sam followed the trend of the long ledge that formed the top of the hill, a sheer steep abutting toward the west, a long rough slope slanting to a dark gorge on the east. Out of this came from time to time the tuneful baying of the hound as he worked southward on the scent, so cold that only in those places that held it best it greeted his nostrils with an aroma strong enough to bring forth his bugle-like challenge. The intervals of silence became longer between the bugle notes, sounding now fainter and further away, till at last unheard at all, though the murmur of a mountain brook changing with wafts of the light breeze, the monotonous song of the evergreens swelling and falling with its varying touch, and a hundred nameless mysterious voices of the woods fooled the hunter's ear now and then. But he had an abiding faith that at last Drive would get up the fox and bring him back along this ridge, and so he listened and waited, sitting on a moss-cushioned log while all the chickadees of the neighborhood came and visited him with inquisitive friendliness, and the jays, at more respectful distance, squalled a protest against his intrusion on their haunts. A solitary crow, belated in his migration, discovered the silent and motionless figure and made as much pother as if it had been a featherless owl or a furless fox, but when his clamor failed to bring any response from the brethren now far beyond the sound of his voice, he flapped away in silent disgust. A red squirrel scampering over the matted leaves in quest of buried treasure, sat up at the toe of Sam's boot, and after a short inspection of this queer black stump, ventured on to it, and then as far as Sam's knee, whence a wink of the hunter's gray eye frightened him in a sudden panic, from which he recovered sufficiently when he had gained the vantage of a tree trunk to rattle out a volley of abuse. When these visitors had all departed and Sam had listened long in vain, he moved on to a bald peak of the hill from which a portion of the valley could be seen, with its cleared fields and wooded cobbles, and farm houses and outbuildings strung along the frozen black road like nests on a slender leafless branch. Some were as deserted to-day as the vireo's nest that hung in a fork of the witch hazel beside him, the inmates away for one day's thanksgiving as the birds were for months of it. But from the chimney of one red-painted homestead, which Sam's wandering glances always came back to, a banner of smoke flaunted, denoting occupancy.

"Someb'dy stayin' to hum t' Pur'n't'ns," he soliloquized. "Guess most on 'em 's gone some'eres tu Thanksgivin', f' the' haint nob'dy stirrin' 'round aou'door. Guess they haint keepin' on 't there, for 'f they was ol' Gran'ther Pur'n't'ns shay 'ould be a loomin' up 'long side o' the barn like a tew storey haouse afire. Wonder 'f the' haint nob'dy t' hum, 'n' the dum'd haouse is afire"—as the chimney belched forth a greater volume of smoke. "Do' know but what I'd better go an' see. That 'ere fox is an ol' N' Hampsh'r traveller, an' he'll tow Drive clean t' the C'net'cut River 'fore he gives it up an' comes back, an' I'll be dum'd 'f I'm a goin' to set 'raound here a waitin' for him 'till t'morrer night. I b'lieve that dum'd ol' haouse *is* afire!" And listening one moment more for the voice of the hound, almost afraid that he might hear it, he started down the sheer hillside, checking now and then his headlong course with clutches on bushes, saplings and tree-trunks, till he reached the level of the alder-bordered brook that wound along the base of the hill. The red winter berries glowed there in vain to catch his eye, and he crushed unseen beneath his feet the scarlet cones of the white turnip drooping on their withered stalks as he breasted the tangled sprawl of the alders. When beyond them he came in sight of the house again, he caught a glimpse of a trim figure as the kitchen door opened for an instant, the flash of a dishpan and the glitter of its discharged contents, and a few notes of a clear voice singing, "The Girl I Left Behind Me." The figure and the voice made his heart beat quicker, but he slackened his pace as he taxed his wits for an excuse for his call. When he crossed the chips in front of the woodshed, he had decided that his first idea was the best to act upon, and that if he did not quite believe it now, he really had believed that the house was on fire. He knocked at the kitchen door and waited long enough for flames to have made great headway, while he listened to the clear voice singing with all the freedom from embarrassment of one who sings without a listener, and for the singer's sole pleasure—

"If ever I chance to go that way,
And she has not resigned me,
I'll reconcile my mind and stay
With the girl I left behind me."

He did not knock again till the words ended, and the singer began to hum the tune in a lower voice. Then the singing and the accompanying clatter of dishes and swash of "wrench water" suddenly stopped, and Sam knew that in the ensuing hush Huldah was wiping her hands on the towel behind the buttery door, that the few quick footsteps took her to the looking glass in the door of the clock, whose ticking he could now hear, and now she was coming. When she opened the door such a bright pleased surprise shone on her pretty face that he could compare it to nothing but the brightness of that morning's sunrise.

"Why, good land sakes alive! Samwell Lovel, where on airth did you come from?"

"Wal," said Sam, his cheeks as red as hers, "I was a huntin' up on Pig's Back, an' I seen the smoke a tumblin' aouten your chimbly at sech a rate 't I was afeared the haouse was afire. I thought most likely 'at you'd all gone off t' Thanksgivin', an' suthin' nuther hed ketched, an' so I come ri' daown. I'm sorry t' I troubled ye, but I'm dreffle glad 't the' haint nothin' afire. Guess I'll be a goin' naow."

"Why, what's yer hurry, Mr. Lovel? Come in an' seddaown an' rest ye a spell. Aour folks is all gone, father 'n' mother 'n' Sis, up to Gran'ther's, an' lef' nob'dy t' hum but me 'n' the cat. I didn't keer no gret 'baout goin' an' so I staid t' hum to keep haouse. Come in an' seddaown a minute, won't ye? whilst I gwup stairs an' look o' that sto'pipe—it *hes* ben kinder aouter kilter. Come in an' take a cheer. The kitchin looks like all git aout [it was as neat as a new band-box], but I wa'n't 'spectin' nob'dy, an' the haint no fire in the square room. I'd take yer gun but I dassent—set it in the corner, er heng it up on the hooks over the mantel-tree there. Father's gun's gone t' V'gennes a bein' altered over tu a—a cap-lock, is 't you call 'em? He thinks they're better 'n flint-locks. Du you think they be, Sa—Mr. Lovel, I mean?"

"Wal, they be handier an' sartiner to go off, but I do' know but what a flint-lock gun is 'baout as good—to heng up, as yer father's does mostly," Sam answered, looking up contemplatively at the hooks where his own gun now hung.

"Make yerself t' hum, Samwell—why, haow I du keep a callin' on ye by yer fust name! excuse me, *Mr.* Lovel—whilst I gwup an' see 'baout that 'ere sto'pipe"

The stovepipe must have been found in satisfactory condition, for Huldah presently reappeared in a smart new calico gown, and with her hair neatly brushed and fastened with a high tortoise shell comb.

"Is it usuil, Mr. Lovel," she asked, after she had set away her dishes, and drawing a chair to the stove, sat down and folded her hands in seemly fashion over her check apron, "for folks to knock at the door when they think a haouse is afire?"

I wa'n't a knockin'!" Sam said, dropping his abashed eyes from her roguish glance, "I was a beginnin'—kinder mawdret, ye know, to bust open the door. I didn't wanter skeer nob'dy, s'posin' the' was anyb'dy t'hum, which I hedn't no idee the' was."

Huldah could not help laughing at this absurd explanation, nor could Sam help joining her, and when they had had their laugh out they found themselves much more at ease and became very sociable. When Huldah again corrected herself for addressing him by his first name, he reminded her of their old school days when she had never thought of calling him anything but Sam. "We wus putty good frien's them times, Huldy, but I'm afeard you haint a feelin' so frien'ly tow-wards me naow, a-Misterin' on me so. I do' know who folks is a talkin' tu when they says *Mister* Lovel; seem's 's 'ough they was mistakin' on me for father or gran'ther."

"Wal then, Sam! 'f 't suits ye any better," cried Huldah, and he declared that it did suit him better, "a dum'd sight."

"I hedn't made no cal'lations on gittin' a reg'lar dinner tu-day, bein' 'at the' wa'n't nob'dy here but me," Huldah apologized, looking up at the clock as it warned for eleven. "I'm dreffle sorry 't I didn't naow, but I'm a goin' t' git ye some nutcakes an' pie an' cheese, an' you'll hafter stay yer stomerk wi' them. You mus' be hungrier 'n a bear, eatin' of your breakfas' 'fore daylight I s'pose, an' a traipsin' raound in the woods all the fo'noon," and she bustled away to prepare the lunch in spite of Sam's protesting that he "wa'n't the least mite hungry, an' 'ould druther set an' talk 'n t' eat."

"It does beat all natur'," she said with an emphatic and rather petulant toss of her head, as she returned from the pantry with a pie and a plate of doughnuts, "'at anybody can enj'y traipsin' raound, up hill an' daown, all day long, arter a leetle insi'nificant fox! An shoolin' an' stumblin' raound the lots all night arter coons! Ketch me, 'f I was a man. But you men folks du beat all creation!"

"Shouldn't wonder 'f we did, putty nigh, 'xceptin' the womern part on't. That beats us, all holler. But I'd a good deal druther ketch ye jest as ye be. I haint hed a chance tu speak tu ye 'lone 'fore in a dawg's age!"

"I do' know 'f nothin' 'at the''s ben t' hender, 'f ye wanted tu," Huldah said, pouting her red lips, "erless you'd forgot where we lived. You haint ben anigh f'r I d' know haow long, an' ye wouldn't t'day 'f you hedn't a thought the haouse was afire 'n' nob'dy t' hum," and the pout changed to a smile.

"If I c'ld raly b'lieve at the time seemed long sen' I'd ben here t' anyb'dy but me, I sh'ld be turrible glad on 't, an' the' wouldn't be no need o' settin' the haouse afire t' fetch me. But ye see, Huldy, yer father he don't set no gret by folks 'at goes a huntin', no more 'n his darter does, 'n' so I haint felt ezackly free 'baout comin'."

"Why Samwill! I wa'n't sayin' 'at I hed anything agin folkses huntin'; I was on'y wonderin' what makes 'em lufter."

"Wal, it's kinder natur' I s'pose, borned inter some on us same's 't is inter haoun' dawgs, an' we can't help a runnin' off int' the woods. Suthin' takes us. An' when 't 'aint none tew pleasant for a feller t' hum, like 'nough he goes off a huntin' er a fishin' oftener 'n he would 'f t'was pleasant. Naow, 'f I hed a haouse o' my own an' someb'dy t' keep it—wal, say as this is kep'," looking around the neat kitchen with a look of admiration that grew as it returned and lingered on the bright face of the young housekeeper, "an' wa'n't allus a scoldin' an' findin' fault, I p'sume to say I wouldn't go a huntin' more'n onct a week in the season on't, 'thaout 't was when oncommon good days come oncommon often."

"The' haint no daoubt," Huldah said, rising in some confusion, and, taking the tea kettle from the back of the stove, going out to fill it, talking back through the open door as she went to the pump, "but what you c'ld *hire* someb'dy nuther to keep haouse for ye"—then the squeaking and gurgling crescendo of the pump's voice drowned hers. "I'm a goin' t' make ye a cup o' tea," returning with the kettle and setting it on the stove, and giving the fire an enlivening punch.

"I wa'n't a meanin' no *hired* help," Sam said—"no, don't make me no tea—I'd druther you wouldn't take no sech trouble—no, not no hired help, but someb'dy at 'ould—'at thought they could stan' it to—to go snucks along wi' me a ownin' of a haouse, an' keepin' on it for me an' her."

"Why, Samwell Lovel! Haow you du go on! Did anybody ever!" cried Huldah, glowing with blushes. Then she held her breath to hear what, she was sure, her lover now must ask. But Sam was frightened into dumbness by his own unwonted boldness; and at last when the silence was becoming painfully awkward, she not knowing what else to say, broke it with the unfortunate remark that "The' was some other nat'ral borned hunter up on the hill, she guessed, for she hearn a haoun' dawg a yollupin' up there." Sam hurried out to listen, and she followed him.

"Wal, by the gret horn spoon!" he exclaimed, as the familiar long-drawn notes of his own hound struck his ear, "I'll be dum'd if that haint Drive, as sure as shootin'! He's brung that 'ere fox back f'm the Lord knows where! Yes, sir," as the musical cry swelled louder from the nearest ridge, "he's jest a shovin' on him, 'n' he's a goin' t' cross by the Butt'nuts, 'n' I b'lieve I c'n head him!"

Sam was in the kitchen and out again with his gun, in an instant, and speeding across the fields toward the well-known runway where three great butternut trees crowned a knoll with a wide spread of thick, ungraceful ramage. Sweetheart and doughnuts were forsaken, love almost forgotten and hunger quite, in the ardor of the chase, though it must be said in palliation of Sam's abrupt departure that he longed to give Huldah an exhibition of his skill as a hunter, to shoot the fox before her eyes and presently bring her the furry trophy of his prowess. But, alas, for his hopes! Before he was within the longest possible gunshot of the knoll he saw the fox crossing it, halting for a moment to look after the bellowing hound, and then disappearing with undulating lopes on his way to the western range. He would probably play when he reached those lines of ledges, Sam thought, and after a little hesitation and more than one wistful glance back to the red house, he went forward. He was ashamed to return now, so unsuccessful.

"My!" Huldah said to herself, as with her plump hand shading her eyes, she watched the receding form of her lover, "I hope to goodness he'll git him!" Then when the fox appeared and disappeared far out of Sam's reach, she exhaled her 'long-held breath in a great sigh, not wholly of disappointment. "Wal, I don't care, he'll come back naow." But when he went on with a swinging stride that speedily took him out of her sight, her eyes filled with tears of vexation. "The 'tarnal great fool! I hope 't he won't never come anigh me agin 's long 's I live an' breathe, an' I hope 't that won't be long—I do! What a plegged fool I was t' up an' tell o' hearin' a haoun'! I wish 't the' wa'n't a haoun' dawg ner a fox in this wide-livin' world for men t' go shoolin' an' runnin' an' traipsin' arter when they might be a doin' suthin' wuth while. He cares more for a mis'able sneakin' fox 'an he does for me, or anything on airth, to run off arter one an' leave me jest when—I wish 't *I* was a fox, an' then mebby—Oh! wouldn't I keep him a moggin' a spell—I won't never speak to him agin so long 's I live an' breathe! Let him hev his ol' haoun' an' his foxes an' his hateful ol' gun an' his everlastin' huntin' 'f he likes 'em better'n he does me. I don't care, so there, naow!" But she was choking with alternating tearful fits of sorrow and anger all the afternoon, and when her father and mother and little sister returned from the Thanksgiving at "gran'thers," they wondered to find her so woe-begone.

"I hedn't no idee," said her father to her mother after furtively watching her as he sat warming his hands at the stove, "'at Huldy keered a row o' pins 'baout goin' t' father's."

When miles away on one of the furthest ridges of the western hills, Sam at sundown shot his fox, and gave the dying brute a spiteful if merciful finishing kick in the head, he said, "Blast yer pictur', I wish 't you hed ha' gone clean t' N' Hampsh'r 'n, I never 'd seen er heard on ye, dum ye! You've cost me more 'n any fox ever cost a man afore sen the' was foxes an' men an' women folks in this world!" He bore an aching heart for many a weary day before he forgave himself or was forgiven by Huldah. How her forgiveness came may be told some time.

One day in the winter Huldah came to Aunt Jerusha on an errand. "I wanter borry your wool caards, Aunt Jerushy, to caard some rolls for father some socks. Aourn is lent, we do' know where." In the conversation that accompanied the borrowing and lending of the cards, Aunt Jerusha asked when Huldah had seen Samwill Lovel, to which Huldah replied with a show of spitefulness that her wistful eyes belied, that she had not seen him since about Thanksgiving Day, "an' didn't wanter, as she knowed on!" Whereat Aunt Jerusha was surprised and grieved, for it was her cherished hope that these two, her favorites among all the young folks of Danvis, would some day make a match. After some coaxing Huldah told her old friend her grievance, and so Uncle Lisha came to know in part the story which we have told for him.

ROWLAND E. ROBINSON.

A WEEK IN BEAR CREEK VALLEY.

IT is a terribly rough day out of doors. The snow flies in blinding flurries while the wind roars among the branches, whistles around the corners and beats in surging waves against the house, reminding me very vividly of my experience in a mining cabin among the mountains of Colorado, and that reminds me of the killing of my first mule deer, or in fact my first deer of any kind. I had seen wild deer previously, but had never been able to call them mine. Four young, at least not very old, men, of whom I was one, owned a hole in the ground called a mine. We didn't call it mine, but ours, and many weary hours have we spent in that shaft digging prospective wealth. It was 3,000 feet higher than Georgetown, which was claimed with much pride by her citizens to be the highest mining town in the world, being about 9,000 feet above the sea. We generally went up to the mine Monday morning, taking "grub" for the week, and returning Saturday to slick up for Sunday and be civilized again. Of course there were a great many who were compelled to "back" it, and naturally we improved our weekly holiday in fraternizing in our dens, where we smoked, exchanged experiences or indulged in music. Many of these "dens" were shaky cabins of one room, built of rough boards battened, and when the wind descended from the mountain tops and ran amuck down the valley, everything rattled, and in winter discomfort was uppermost. Many cabins were braced with trunks of trees, and some anchored to the rock with iron rods. I remember very well lying awake nearly all of one night when the wind was high and howling, fearful that the next wave would send us all flying, but before another night came I had dragged two large pine saplings from the mountain side and braced the cabin securely.

Being naturally fond of hunting I had improved several opportunities for short trips, killing grouse, squirrels and rabbits, and once very foolishly following a "lion" the better part of a day in the snow, armed with a disreputable old carbine, the like of which I never saw before or since. Fortunately I did not come up with the beast. I had seen a deer or two, but got no shot.

One night as three or four of us sat in a friend's cabin smoking, the conversation turned on hunting and Rogers said he would like to go over to Bear Creek Valley after deer for a week if he could find some one to accompany him. I quickly replied that I was the "some one" he was probably in search of, but that I had no suitable gun, to which he replied that if I would go he would get me a fine Henry rifle which was new and owned by an acquaintance from Boston, who, judging from what I saw of him and from his appearance, was afraid to shoot his gun. Tenderfeet were not infrequent in those days, who made their appearance with valuable guns and belongings and did most of their hunting around the billiard table. Rogers was a companionable young man whom I had known in the "States," but I had never suspected him of a fondness for hunting, though I had known him to be the dear's man. His appearance was decidedly distingué. He was tall, well formed, black-eyed, and of dark complexion with black mustache waxed à la Napoleon. He was generally attired in a broad-brimmed felt hat, the brim turned up on one side and down on the other; a short coat of the shooting style; velveteen trousers tucked into knee boots that shone from top to sole, and you would have declared that the most of his blood was Spanish. He had been sent out by the owners of the Astor lode, lead, crevice, mine or hole in the ground, to look after the same, and like many other ventures, the output was not sufficiently large to worry the owners or Rogers as to its disposition.

Well, the gun being secured, much hunting talk indulged in, preparations made, bright anticipations indulged, the day set and a horse engaged at the livery stable, one fine morning late in October found me with my impedimenta prepared to mount. The broncho led out for me looked gentle and docile enough, without an undue amount of evil in his eye, but "put not your trust in princes." I mounted and we moved off in a respectable manner, but just as I was getting settled in my saddle the beast stopped without any apparent cause and there was a decided and instantaneous upheaval. I took in the situation necessarily. Fearful of need I had buckled on a pair of wicked Texas spurs with very sharp rowels, and as we struck ground I sunk these rowels into that beast with all the power at hand—or leg. There was another ascension, a flying panorama of man, gun, rations, blankets, etc., and we hit the earth again with a demoralizing impact and more very vigorous rowel work. A third time we left *terra firma* and a third time the spurs got in their legitimate work, when the horse started down the road in a business way as if it had suddenly dawned on him that he had an urgent errand somewhere and had wasted valuable time. As for me, "Barkis was willin'." The fastenings had all held and nothing was lost except time, and I hardly think that was lost, for the brute vexed me no more.

It was a glorious morning. Georgetown had hardly waked. There was a suggestion of frost in the air which was clear and still and of wonderful transparency. In magnificent array on right, left and rear rose the mountains, above which the sun would not show his face for three or four hours. Afar up the mountain sides could be seen here and there stretches of trail leading to mines, the dumps of which were occasionally visible, while now and then a cabin, perched against the rocks or showing its face from among the pines, looked like a child's toy. Wood slides appeared at intervals, down which, from the upper heights, wood for use in the valley daily shot with frightful speed, waking the hoarse echoes of the cañons and taking the final leap of 50 or 100 or more feet over the sheer face of a rock wall, to crash in bruised and splintered heaps at the base. Clear Creek, on my right, kept me delightful company, and we ambled along together until we reached the reduction works, a mile below town, in which Rogers had a room and where I was to breakfast with him.

Breakfast was not ready, for the cook had slept late, but he was already skirmishing with the frying pan and coffee pot, and before long we had filled up. Rogers had saddled up, and with pipes alight we rode off down the valley in high feather. And was there not good reason? We were young, strong and lusty. The morning was perfect. Our mount was good and the unspeakable delights of the chase and exploration of new territory were before us. Cause enough for exhilaration.

The valley narrowed and widened as we rode, Clear Creek babbled and boiled at our side, or far below in rocky gorges, while frequent tunnels in the rocky mountain sides, or sluice boxes and abandoned gulch mines spoke of the greedy search for riches. Downieville, Mill City and Fall River, with naught but its name to remind one of the busy Eastern city, were passed, insignificant places all, and about noon we reached Idaho Springs, fourteen miles from Georgetown, where were and are famous hot springs for the "healing of the nations," according to the proprietors. Hot and cold springs, in close, neighborly rivalry, pour out their waters impregnated with sulphur, soda, magnesia, iron and what not, for which bathers pay their money and take their choice. There was quite a good hotel here and a little hamlet, enlivened daily by passage of stage to and from Denver, and ox teams freighting to the mines. Our way left the dusty valley road here, and after a short halt we turned to the right and took the trail leading over the mountains into Bear Creek Valley, a ride of eight miles over a hard trail. After we had ridden well up the mountain side we stopped for lunch, which being dispatched as we reclined under the pines by the side of the trail, I made a few trial shots with my Henry, which I had never fired, and I became satisfied that if a deer would stand still at 75yds. and allow me to choose my rest, he was my meat. We mounted and rode on. The way became steeper and the trail dimmer as we climbed "Old Chief," that, with the "Squaw" and "Pappoose" (of which almost every mountain region has a counterpart in name) kept silent and eloquent company. Ere long we rode into snow and the trail disappeared, but blazes guided us until we had passed the crest and began our descent into the valley, of which occasionally, between the trees, we had beautiful glimpses.

How impressive is a ride through a vast forest, far removed from the busy haunts of man (sounds natural, eh?) where the snow lies unbroken or otherwise on the ground. A vast white waste stretches afar on every side (this is not stretched). Vanishing vistas and tortuous aisles of ermine are outlined by bare boles and asthmatic pines, through whose shivering branches soughs the breeze sou' by sou'west. Not a sound is visible. An awful stillness pervades the circumambience. It is the stilliest kind of stillness ever instilled or distilled, and like the man o'er-come by influence of vinous fermentation, "Shoost as shtill like he had a fit." You have heard of the "stilly night;" well, the stilly day pushes it pretty close, along about dark. As you note the dead bodies (ugh!) of the fallen monarchs of the forest (familiar again) wrapped in their clinging winding sheets, the goose flesh comes out all over you, and at this funereal moment the only incense to be had arises from the nostrils of your horse. Perchance, from afar in the lonesomeness comes an unearthly sound, half sob and half scream, like a wail of the lost (pat again) and visions of savage beasts "dance through your mind." Your hat begins to rise, and a spookiness begins to develop, while the gooseflesh grows more prominent. But it is only the limb of a giant impinging on another as they scratch each other and give audible vent to their enjoyment. Again silence reigns. What solitude is this! How unlike the busy, bustling, boiling, banging, boodling marts of trade. Scarce two points in common unless mayhap it be the bears. Now the wind rises. Old Boreas careers upon the—But hist! Hark! "Rogers, what is yon delicate footprint on the snow forceninst ye? By the jumping Jerboa, it is, it is, the outline of a deer's foot." Sentiment to the winds. Forward!

But we had no time to follow deer trail then, so we followed our own, which zig-zagged down the mountain, now on a bleak, wind-swept bit of barrenness and now winding through pleasant shaded vales, thickly carpeted and shaded by dense pines, where pure spring water, cold and sweet, bubbled up and ran off down to meet the waters of Bear Creek far below. We passed a huge log bear trap, tenantless now, but it was easy to see "with the mind's eye, Horatio," a tremendous cinnamon pacing back and forth in his massive prison endeavoring to lift the huge logs that inclosed him. Toward sundown we rode into the valley, and turning to the left went down past a ranch or two, and about dark pulled up at our destination, the ranch of Mr. W. E. Sisty, where we received a cordial welcome from mine host and his pleasant wife. The horses were soon unsaddled, ablutions performed and we were summoned to the cheerful board, the summons being obeyed without the necessity of a repetition. I think I can see that table now, as we sat around it enjoying the good things provided and talked of the prospects for deer, trout, sheep or mayhap a grizzly or lion, listening to tales of adventure and experience from our host. With what delightful anticipation we drank it all in with our coffee, eager for the morrow when we should bowl over the watchful deer. After supper we seated ourselves outside, where with pipes asmoke, we watched the darkness settle down from the environing mountains and the stars shine out "in quiet skies" as we laid our plans for the coming day. It came, after a night of refreshing sleep, and after breakfast and directions from Mr. S., Rogers and I set out on foot diagonally up the valley toward a high ridge, down which led a deer trail, over which deer passed frequently, crossing the valley to the opposite mountain.

We crossed Bear Creek, and after a short walk reached a beautiful glade where the grass grew luxuriantly, and noble pines at intervals stood looking down on a most beautiful natural park. It was a charming spot, and while I was slowly walking along admiring the loveliness of the scenery, and thinking what a fine place it was to knock over a deer, Rogers being on my right at a distance of a hundred yards or so, I saw a movement ahead and a little to my left where the ground sloped downward to a little stream that flowed at the foot of the mountain. I stopped instantly, dropped my gun from my shoulder to a ready, and as I did so a doe walked up into view, took a few steps forward, took a glance around, and then as if satisfied with the outlook, began feeding. She was followed in an instant by a fawn, then came another doe and her fawn, followed by another deer that I supposed was another doe, the distance being too great to distinguish clearly, and bringing up the rear was a lordly old buck with a grand head. He took a long look around and then all six strolled forward, feeding daintily along whenever they spied a choice nip. I glanced at Rogers. He was motionless, with his eyes on the beautiful picture. As I said they came from my left and passed not at right angles to my direction, but quartering so that gradually they were nearing me, but would pass much nearer Rogers on my right, if unmolested. I thought of what a relative once told me of "buck fever." He was an experienced hunter and had had it badly, and predicted that I would know all about it when I should see my first deer. I wanted the buck badly. I wanted those antlers. I judged the distance was 100yds. But just as I was awaiting the most favorable moment the buck stopped behind two huge pines that started from the same root and separated just above ground. I could see a narrow strip of his body between the trees, and part of his face to the right of the right hand tree. No buck fever yet, thought I, and then Rogers's gun spoke. The deer threw up their heads and stood motionless. Bang! went Rogers again, and this time the deer, locating the mischief, wheeled and took the back track like the wind. All whirled from me but one, which turned my way, and as he presented his broadside I gave him mine, only to quicken his motion. Down went the lever, up went the gun, and I sent another bullet after him, only to see him straighten himself yet more. Rogers came running toward me, saying something, and as he did so I saw the deer pitch headlong. "Hurrah!" shouted I, and it was neck and neck to the quarry. As we reached him my knife was out and quickly in his weasand. There he lay, my first deer, and though he was a full-grown two-prong buck, he was not nearly so large as I thought he ought to be. How beautiful were his sleek sides. What grace and strength in his sinewy limbs. How pitiful were his full dark eyes, fast glazing. How large were his ears, and what a fine taper to his delicate nose. How proud I was of my first deer. But Rogers did not seem very enthusiastic, and vaguely hinted that perhaps he might have had a hand in the slaying. Up to that moment I had not a doubt as to the responsibility, and indeed there was none, as I soon convinced him by the location of the wounds and size of bullets, his being considerably smaller than mine. Both shots had struck; the first through the paunch and the last square through the heart. Glory enough for one day. We soon dressed the game and hung it up in a tree, held a council of war, and started, Rogers to follow the trail, and I to go straight up the ridge, meeting him at a designated point in an hour or two. I picked my way up the mountain, stopping now and then to breathe, which afforded me a good opportunity to try and locate that tree that bore the beautiful deer fruit. I have many times since passed gloomier days than that. Arriving at the top of this ridge or spur of the mountain, running parallel with the main range for quite a distance, I took my way along its backbone and soon struck into a deer trail which ran along the ridge and appeared to be regularly used; and the thought popped up, "There's plenty of time, it's a fine day, there's one deer safe, why not sit down a while and keep this trail from running away while we smoke a pipe?" I fell in with the idea to rights, the light wind being in my face, filled my pipe, sat down on the pine needle cushion that presented itself, put my back against a rock just off the trail, where I had a good view, and with my gun across my knees took a half hour of solid comfort.

It was, indeed, a most lovely day. The air was mild and soft and just a trifle hazy, a typical Indian summer air. The mild November sun, just warm enough to make one comfortably lazy, glinted among the pine needles and powerfully encouraged my *dolce far niente*. The smoke rose and floated away on the gentle breeze amid a silence that was absolute. Neither bird, nor beast, nor creeping thing broke the quiet that rested on the mountain, and after listening in vain for Rogers's gun or voice, I rose and proceeded, pipe in mouth, along the trail. After some minutes walk, the top of the ridge being almost devoid of timber, I bent my steps diagonally to the left for some score paces toward a growth of young pines four or five feet in height, and when within about fifty yards of the growth, which was quite dense and in the nature of a fringe, I was stopped suddenly by the appearance of something that had suddenly and but once moved above the tops of this fringe. The wink of a deer's ear suggested itself to me. I waited a few seconds, silently cocking my gun. There was that something left of the wink, but motionless. Was it an ear or only a tip of a pine? Suddenly it disappeared and then came into view again. I suddenly raised my rifle, forgetting my pipe which was in the right side of my mouth. The gun hit it and the ashes flew into my eyes. I held the gun up with my left hand, wiped my eyes out with the right, changed my pipe to the other side of my mouth, thinking as I did so, "Where's your buck fever?" and drawing down to where I thought the deer's side should be, if he stood as I thought he did, let go, rapidly throwing another cartridge into place. That ear, or whatever it was, was still in position. "Too high," thought I, so I dropped a little lower and spoke again. Then there was trouble. That ear disappeared and there was quickstep music *diminuendo*. I took the same time *accelerando*, and found that some three-legged creature had gone down the mountain in great haste, plowing the carpet recklessly. I followed for nearly 200yds., keeping the trail ahead, when on a big pine I saw blood and hair, and reaching it I found square to the left, six or eight feet distant, the owner of the ear, a fine fat doe, *in articulo mortis*. I leaned my rifle against a tree, put my knife to her throat and cut a pigeon-wing that Morlacchi (If I'm right), or any other danseuse would have given all her drapery to accomplish. More glory. I was chock full of whoop, but I didn't let it out for I did not know but Dame Fortune intended to keep me in deer now that I had gotten fairly at it, and I didn't want to do anything to discourage her. So I went through the motions of ecstasy and settled down to business, which was to relieve the doe of useless viscera and get her up into a tree secure from any loitering "lion." After much tugging and heaving I accomplished it, and straightway filled another pipe in honor of my prowess. I have killed a good many deer since, but never has my cup been so full to overflowing as just then. After stroking myself down and swelling myself out a while, I ascended to the ridge and waited some time for Rogers, but not seeing nor hearing him I strolled onward in hopes of getting another shot, gradually porting my helm and pointing for the ranch which I reached about noon, finding Rogers at full length on the lounge making fearful grimaces with a toothache. Quoth Mr. Sisty:

"You had good luck this morning."

Said I, very carelessly, as if I had always killed one before breakfast each day, "Yes, I got a couple."

"Got what?" said both, as Rogers rose on one elbow.

"Got a couple," said I again.

"You didn't, though," said Rogers.

"Rogers," answered I, "You shouldn't contradict, it isn't good manners, and especially such an old ramrod as you know me to be."

"Well," said Mr. S., "We'll take the pony after dinner and bring them in—if we can find two."

"If your pony can't carry two deer you want to take another one along," said I, and proceeded to remove the stains of battle. We were soon seated around the table, where the story of my exploit was drawn from me, very reluctantly, of course, and I was heartily congratulated. After dinner we mounted our horses, and with much talk and good feeling soon had No. 1 across the saddle of Mr. Sisty's pony, after which, after some meandering, we found No. 2, and the pony carrying double without any trouble, delivered them at the ranch without mishap, and we were fed on venison during the remainder of our stay.

After supper we went to a beaver dam some distance down the creek, and tore away the dam to some extent, hiding in the bushes to get a shot when the beavers should come to repair it. But although we could see them in the moonlight some distance up the dam, and hear an occasional slap of a tail, they kept away from the break until we were tired of waiting and went back to the house.

The next morning we were early afoot and out after deer, Rogers going in one direction and I in another, to meet on a distant mountain about noon. I saw much deer sign and hunted carefully, but without success, as did Rogers. We were gone all day, and had a long, tiresome tramp, with nothing to show for it but a rabbit. It was a lovely day and I enjoyed it immensely. The clear blue sky, the rocky steeps, the wooded slopes, the beautiful valley threaded by the pretty stream whose gleam appeared here and there, combined to form a lovely picture. What comfort it was, when tired, to sit down on the mountain side with pipe alight and plenty of time and enjoy it all *ad libitum*.

After supper that evening Rogers and I went to the dam to watch for beaver again. We found the dam fully repaired and everything in order. We tore it away again enough to lower the water some and hid to watch; but it was useless. We saw the wake of one or two swimming, but none came near the break, and after waiting until we were thoroughly chilled and sleepy, we returned to the house. The next morning I rejoiced at signs of snow, but Rogers's tooth ached so badly that he decided to go home and have it pulled. Mr. Sisty said he had a pair of shoemaker's pinchers that he thought would fit R.'s mouth, and tried to find them but without success. I told R. that I would tie a string to a bullet and the other end to the tooth and I felt sure I could fetch it if I pushed on the gun, but I think he was homesick, for he would not consent, and after breakfast saddled up and departed up the valley, leaving me to stay the week out.

The question of trout fishing arose, and Mr. S. said he knew of one hole up the cañon where he thought the trout wintered, that it was the deepest of any he knew of, and that if they were not there we could scarcely hope to find any at this season in this part of the valley, so we took lines and guns and rode away. After following the creek quite a distance we came to a point where it issued from the cañon, and as it would have been difficult, if not impracticable, to follow it, we kept up the main valley to the right, with the low range or spur of mountain between us and the creek. After going two or three miles we turned to the left and ascended the mountain to the top, perhaps a thousand feet, hitched our horses—for we could not descend with them—and picked our way slowly down afoot to the bed of the creek. Here we found the hole, covered with ice, excepting a small space where the water entered over a little fall. Snow covered the ground on each bank, and winter reigned. We had expected to find bait of some kind, but it was impossible, so we took a bit of green leaf, put it upon the hooks, and let it float down under the ice. A tree had fallen across the hole a few inches below the entrance. One of us stood on this and the other just above the entrance where he could see down into the hole under the log. Then the hook was dropped gently down and the current carried it down under the tree. The trout were so sluggish that they were not particular whether they had any green leaf or not, but came up toward it in a very indifferent manner, half taking it in and spitting it out again, but at last, when the watcher above the entrance saw a trout take it in, he gave the signal and out came a fine trout. He was laid on the snow, where he was a very cold corpse in a very short time. We cut the belly-fins from him for bait, and in a little while we had on the snow nine fine fellows that averaged nearly a foot in length. Then the sport ceased, for no lure that we could invent was of any avail. So we strung the fish upon a twig and laboriously climbed to the horses, and slowly rode homeward, keeping a sharp lookout for deer, but without success. We saw considerable beaver sign this day, but no beaver. That night Ed. Sisty (the son) and I went to the dam again, tore it away as before, but could get no shot.

Snow sign was all gone the next morning, but I went out as usual after deer, having a line in my pocket. I found any number of fresh tracks, but although I hunted faithfully, I was unrewarded. Walking along the side of a mountain, when I had concluded to descend into the valley, I saw, sixty or seventy yards ahead of me, near a ledge of rocks, a white rabbit sitting looking at me. I said to myself, "Ole har, I'll take you along." So I sat down at a convenient spot, held the gun across my knees, drew my eye "well down into the sights," but not so far but that I could get it back again, and fired. "Br'er Rabbit sot dar, he did," just the same. I pumped in another cartridge and drew fine on him, and when the smoke cleared away there was "Br'er Rabbit, and he wink he eye slow." I began to be interested now, and yet once again I pulled on him, but though the dust flew, Br'er Rabbit stood the storm like a veteran, and "kep on sayin' nuthin'." I looked at my gun, lock, stock and barrel, examined the sights, looked at objects around to see whether I was cross-eyed, and, called on the spectre again. Then he must have heard something unusual, for he turned and went "lippity-clippity, clippity-lippity" toward the ledge, disappearing behind it, and I saw him no more.

I laid my course for the creek then, and struck it near quite a large hole, and concluded to discover whether all the trout had descended to the Platte, as had been reported, so I baited my hook with an entomological specimen that I found under a log, and in less than a minute I had a trout on land, and I continued to pull them out until I had eight good ones, but not as large as those of the previous day. Then the sport ended and I went to the ranch.

The following day was Saturday, my last in the valley, and I determined to put in every hour faithfully that I might take some venison home to my "bach" partner. I started early and went over to the "big mountain", to ground that I had not hunted over. Sign was plentiful. I hunted very leisurely, stopping often and using my eyes and ears faithfully, but with all my care and caution the deer refused to materialize. Not a deer did I see or hear, but I enjoyed that day's tramp exceedingly nevertheless. I enjoy to the full being in the wilds alone, and especially in a strange country. The fascination of the woods, mountains and streams took possession of me when but a boy and has held possession ever since, growing with my growth. What possibilities are there in the solitude of the forest. What graceful combination of branches and boles. What chants from leafy boughs. What "music in the air." What a grand chorus when all nature is in harmony. What symphonies in grays and browns. What lessons in architecture. What studies in perspective. What plays of light and shadow. What a subtle, undefinable influence that takes possession of one amid such surroundings, banishing, for a time at least, the rasping cares that, born of intercourse with men, worry and harass the should-be peaceful life. Happy indeed is he, who

> "Finds tongues in the trees,
> Books in the running brooks,
> Sermons in stones and good in everything."

So passed my week in Bear Creek Valley, every day full of solid enjoyment, brightened by the kindness and cordiality of host and hostess, who could not do too much for the "stranger within their gates." I never and shall never think of them without a benison. May their lot always be cast in pleasant places. O. O. S.

JAMES M. LE MOINE.

[The following paper, from the pen of our occasional correspondent, Mr. Charles Lanman, will appear in the second series of his "Hap-hazard Personalities."]

AS I remember the good old times, when I frequently visited Canada for the purpose of catching salmon and sketching its scenery, I never fail to recall my intercourse with James Macpherson Le Moine. He was always ready to do his best for the gratification of all tourists from the United States, and by means of his industrious pen, he has honorably and permanently linked his name with the history, the scenery and the people of the Dominion. He was not himself a fisherman, but well posted in regard to all the more interesting localities, where sport was to be found, and his advice as to the best methods for traveling and camping out was always freely given and highly appreciated by its recipients.

Mr. Le Moine was born in Quebec on the 25th of January, 1825, his paternal ancestors having been people of distinction in France, while his mother was descended from the Macphersons of Great Britain. He spent his early youth at St. Thomas, under the care of his maternal grandfather, Daniel Macpherson; was educated at the noted Seminary of Quebec; studied law, came to the bar in 1845 and practiced the profession for several years with the late Charles Holt, of Quebec, of honorable fame; but but having a decided taste for literature, he subsequently devoted the most of his time to the writing and the publishing of books, in both the French and English languages. As an author his career has been marked for its untiring labors, resulting in a large number of works, chiefly connected with Canada, and all of which have been eminently successful. In the Historical Library of Quebec are to be found not less than twenty of his publications; but those which I would designate as my favorites are the "Legendary Lore of the Lower St. Lawrence," a series of essays entitled "Maple Leaves," "Quebec Past and Present," "Chronicles of the St. Lawrence," "Ornithologie du Canada" and "Les Pecheries du Canada." To these, in the purely historical line, might be added two volumes devoted to Generals Montgomery and Montcalm, the former production having done much to make the people of Canada better acquainted than they were before with the exalted character of the American general. By his descriptions of scenery, happily blended with the traditions of the land, he has proven himself the possessor of a poetic mind; by his investigations in natural history he has won the applause of scientific men everywhere; and by his perseverance and skill as an antiquarian, he has rescued from the past very much information, which will hereafter be of great value to the writers of systematic history. Possessing in an eminent degree all the instincts of a true conservative, he has won the respect and affection of both the French and English races of the Dominion; and had he chosen to descend to the purely political plane of public life, he would probably have won the highest accessible honors of his time. Rather than yield to the sordid temptations of public life, he has ever preferred the quiet sphere of a man of letters, and his beautiful home, known as Spencer Grange, has ever been the meeting place of the most cultivated society of Quebec and their chance visitors from abroad. It was on the occasion of his building a new tower at this happy home that his numerous friends—the best people in Quebec—gave him a grand reception and presented to him, for that tower, a handsome Dominion flag, as a tribute of the high regard in which he was held by the people of Canada, for his many and important services. In the long and minute address that was made on that occasion the speaker gave, among many others, the following reason for the honor conferred: "He has described and made us proud of our Canadian homes, pointing out to the readers of his works and to the numerous travelers who visit this city that our residences are scenes of domestic virtue, honorable living and Christian happiness. In no Canadian home is this more remarkable than in his own. If we, who are his friends and neighbors, recognize this, what more royal present can we give, than by crowning his residence with a flag, and claiming our right as free men, to plant our standard of good will and friendship on the tower of our honorable friend's house—Spencer Grange."

In one of the volunteer speeches made on that occasion, an incident was mentioned, which, I think, for its general interest alone, should be repeated in this place. "I casually met," said the speaker, "a stranger, a titled gentleman, who told me he had met me before. 'You are from Quebec. Do you know Mr. J. M. Le Moine?' said he. 'Right well,' I replied. 'Are you aware of the service he rendered my family by helping me to make good my descent from the most illustrious old Canadian family—the house of Longueuil. Through his researches and with the help of Lord Lorne and his great adviser, Sir John, I am now, by the gracious act of Queen Victoria, Baron de Longueuil.' Thus, most unexpectedly and strangely, was forced on me another proof of services rendered through the writings of our guest."

Another tribute, which, for its gracefulness, I cannot refrain from reproducing in this place. It is in the form of a sonnet and comes from the pen of William Kerr, of Niagara:

> "I love Quebec for three good reasons, one,
> Her matchless beauty that so takes the eye,
> Her famous history in the years gone by—
> And last for sake of him, her worthy son,
> Bone of her bone, whose facile pen has run
> Through tomes of legendary lore that vie
> With what the world loves best; and so love I
> Quebec for these good reasons, and upon
> The plinth of Wolfe and Montcalm lay my hand,
> And call to witness all the varied land
> Seen from the lofty Cape's embattled coigne,
> Mountain and vale and river, isles that gleam
> Resplendent with the memories that beam
> Upon them from the pages of Le Moine."

On five different occasions did the Royal Literary and Historical Society of Quebec, founded under the auspices of Lord Lorne, select Mr. Le Moine for their President, and he was also made an honorary member of many other societies in New Brunswick, France and the United States; and for many years past he has held the responsible position of Dominion Inspector of Inland Revenue at Quebec, which has done much to help him in his historical investigations.

In further illustration of the characteristics of my Canadian friend, I must not omit to mention one or two additional particulars:

When Dean Stanley visited Canada and was the guest of the Governor-General, the Earl of Dufferin, his Excellency requested Mr. Le Moine, as the historian of Quebec, to play the part of assistant host in the investigation of the city wonders.

In speaking of Mr. Le Moine's home, known as Spencer Grange, as a charming center of refinement and culture, I should not omit to mention one of its peculiar charms, as follows: Prompted by his devotion to ornithology he built himself an aviary and filled it with the beautiful creatures whose habits he loved to study; and appended to it a regular museum of natural history specimens, as well as an extensive collection of books, old-time engravings and curios, connected with the history of Canada. When George Augustus Sala happened to be a guest at Spencer Grange, he was greatly pleased with all that he saw under the roof of his host; and it so happened that his surprise knew no bounds when he found himself surrounded by a host of goodly citizens of Quebec, who had come together to celebrate an annual grape festival, organized and perpetuated by the owner of the Grange.

In concluding my brief notice of Mr. Le Moine I use the language and indorse the sentiment of a paragraph which I find in the "Cyclopædia of Canadian Biography," as follows: "He has had the good fortune to handle Canadian history and its burning questions of creed, race, etc., with so much impartiality that rarely have his views been challenged. * * One wonders how and when he could have found time to treat of so many subjects. * * Hospitable, genial and courteous, he is respected for his talents and beloved for his large heart."

DO SQUIRRELS HIBERNATE?

Editor Forest and Stream:

I see by your last issue that certain correspondents want information on the question of squirrel hibernation. I would like to add a little negative evidence, which seems to indicate that the squirrel does not hibernate.

In Manitoba, after once the winter sets in, it usually continues with steady frost, and in the fall of 1886 the cold weather closed in as usual about the end of November, and from that time up to the middle of January when I came away, the thermometer usually showed from 10° to 30° below zero, with a minimum of 38° below, and I believe a maximum of 10° above. I was out shooting nearly every day, and nearly every day I saw red squirrels running about among the oaks, either foraging or playing, much as in the early fall.

As late as Dec. 28 I find in my diary the following note: "While camped for dinner several red squirrels chattered in the branches overhead. Two were chasing each other from tree to tree, over the snow, and during their excitement several times came within six feet of where I sat." I have no note of the temperature that day, but it was certainly at least 20° below zero.

ERNEST E. THOMPSON.

TORONTO, Feb. 5, 1887.

Editor Forest and Stream:

Speaking of squirrels and whether they hibernate, store up food for winter use, etc., I noticed a curious thing a day or two ago. I was walking in the country. By the side of the road was a path firmly trodden. The ground was wet, but the path was firm and hard. I noticed a gray squirrel in front of me and stopped to watch the little fellow as he hopped slowly along with his nose to the ground, smelling on first one side of him and then the other, as if trying to locate something which he knew to be in that neighborhood. Finally he seemed to find the right spot, and began digging in the path with his paws. After a while he drew forth something which he immediately began to eat. Before he had finished I accidentally made a slight noise, when the squirrel, turning his head, saw me, dropped his prize and ran off. Upon going there I found a large white oak acorn, sound, partially sprouted and about half eaten by the squirrel. It had been buried in the ground to the depth of 1½ to 2in., as I could plainly see from the impression of the acorn in the ground (the hard path) from which the squirrel took it.

Now, how did that squirrel know that acorn was there? Did he bury it there last fall and remember the spot? Or, did he smell it and find it by scent? Either solution attri-

butes remarkable power to the little animal; the first necessarily accredits him with the forethought of seeing the necessity of laying up winter stores, and the wonderful memory that enabled him to locate the particular spot at which he had planted the acorn. The second solution accredits the squirrel with a nose which would do credit to a pointer or setter. Yet he appeared to be searching by scent when I saw him find the acorn. AH-PE.

MADISONVILLE, Tenn.

Editor Forest and Stream:

It must appear positively plain, I think, after what has been said on this subject, that neither red nor gray squirrels hibernate, at least in the latitudes of the United States. But nothing has been said about the little chipmunk. He goes into winter quarters in early November, and does not show his head until April, thus making five good months at least, underground, in northern Maine. They are a pest about the orchard, not so much for what they eat, but because they will cut off the apples very fast, dropping them to the ground, all through the fall months, thus destroying lots of fruit. He is very sly about digging his hole, carrying the excavations some distance away from the mouth of the hole, so that it has been said that he begins to dig at the other end of his burrow. He lays in large quantities of supplies of corn, nuts, etc., for winter use, and we may well suppose he spends some of his long winter evenings making way with his stores. J. G. R.

BETHEL, Me.

"GUN OR FIELD GLASS?"—Syracuse, N. Y., Feb. 10.—*Editor Forest and Stream:* I dislike to pick a quarrel with any one, and do not intend to now, but with your permission I would like to say a few words in response to what was meant for a cutting criticism which appeared in your columns for Feb. 10, on the sentiment of my article in *Scientific American*, which owing to a misprint was entitled "Our Warbler" instead of "Our Warblers." In the first place the article was written for the purpose of bringing the study of birds before the mind of the average person, as will be seen by reading the first eight or ten lines. Mr. Sumner evidently has not studied birds much, or else he is a very slack student. How is it possible to study birds and know what species you are studying unless you do kill occasionally for identification? Mr. S. suggests "using field glasses." All right, take your glasses and go into a country containing a bird fauna with which you are unacquainted, (if such an one can be found) and see of how much service they will be to you, until you have learned to distinguish at sight the various forms. Bear in mind the statement that the article was written mainly for those unacquainted with this family, or with birds in general, and then tell me whether or no my statement will not justify me. Further on, Mr S. alludes to the shooting of the parent birds for identifying the nests and eggs, in a disparaging manner. Here again he is mistaken. Of what value would a nest and eggs be to science without being identified, and if I find a nest and eggs, and fail to recognize the parent bird, am I not justified in killing it to identify, providing I do not repeat the performance on that species again? I have studied birds constantly for eight years, and have yet to commit an act in the woods that would cause shame to a true naturalist. Mr. S. speaks of "wanton slaughter." Where in my article do I allude to "wanton" or any slaughter? I would state for Mr. Sumner's benefit that after I have once seen a bird, and know what it is, I seldom fail to recognize it a second time, and if I do, have no scruples in killing it a second time. If Mr. Sumner's method for identifying birds, and studying them scientifically, differs from this, I should be glad to hear from him and receive some suggestions.—E. M. HASBROUCK.

HABITS OF THE BEAVER.—Bethel, Me.—Your Cache Creek correspondent "R. M. C." wishes some light thrown on Gen. Drason's assertions about the beaver's sinking one pine tree and floating another. I hunted among the beavers for twenty-five years of my life, and have seen a great deal of their works. I have never happened to see where they cut pines for food; they cut everything that is handy for building dams and houses, but their food consists more of the willow, birch, maple and ash than any other, although they do use some other kinds of wood when hard pressed for a choice. The process of sinking their food timber has been and is still a mystery to hunters and everybody else. The Indians say that after the wood is cut into lengths (usually about two or three feet) a beaver gets at each end of it and sucks the air out, when it immediately sinks; others say they load it with mud and sink it, but it is a fact that they do sink all their winter food in the pond they have made with their dam, and then dive down through the under door of their house, under the ice of the pond, and bring up a stick, as wanted, into their house and eat off the bark and throw the stick away on top of the ice or on the bank near their house.—J. G. R.

RISSO'S DOLPHIN IN AMERICAN WATERS.—Angelo Heilphin, of the Philadelphia Academy of Sciences, in a note to the Philadelphia *Ledger*, says: "It may be of interest to many of your readers to know that the cetacean recently stranded at Atlantic City, and recently brought to this city, is a form practically unknown on this side of the Atlantic, and, indeed, as far as I have been able to determine, one which has never before been noted as occurring on the American coast. It is the variety known to naturalists of *Grampus rissoanus*, Risso's dolphin, a form peculiar to the Mediterranean and adjoining seas, and first described in 1812. The animal is apparently of full size, measuring about 11 to 12ft., and is readily distinguished from other allied cetacean forms by the peculiar slaty lines which traverse the body in all directions. Its occurrence on our coast is an interesting feature in geographical distribution, and proves the impracticability of drawing sharp lines of demarkation in the delimitation of marine faunas."

SHORT-EARED OWLS IN ILLINOIS.—Carrolton, Ill., Feb. 7.—The short-eared owl (*Asio aicipitrinus*) is quite plentiful in this vicinity this winter. I obtained three specimens within the last four weeks, two of them almost in our city limits. A friend informed me that he shot six in his cornfield last week and saw more than a dozen other specimens in the same field. I presume our resident birds have been reinforced by migrants driven from the north by the severe winter.—J. G. HENDERSON.

ROBINS AND CHINA BERRIES.—Bainbridge, Ga.—The robins come here in January, remaining until March; they keep together in large flocks and feed upon various kinds of berries. They are especially fond of the berry, a seed which hangs in clusters to the china tree, which is found everywhere in Decatur county. They will eat so many of these seeds that they frequently fall from the branch to the ground and are occasionally picked up dead; whether the seed intoxicates them or not I do not know, but after a surfeit of them they are often caught alive under the trees lying on the ground. The robin when feasting on this favorite seed frequently flies off to the nearest pool or stream to drink, returning again to the tree. The wild black cherry which grows here has the same effects on some other birds as the berry of the china tree has on the robin.—EDWARD JACK. [The intoxicating effects of the china tree berry on robins was noted in our columns a few years ago by "N. A. T.," of Texas.]

THE WEIGHT OF QUAIL IN THE SOUTH.—*Editor Forest and Stream:* In this section of country we have two varieties of quail—one "uses" (as the negroes term it) about the swamps, while the other "uses" in the pine hills and highland fields. The swamp birds weigh at least two ounces heavier than the other birds, and are considerably darker in color. I killed one of these swamp birds some time since that weighed 7½oz. The average weight of the highland bird is 5½ oz. Have any of your readers noticed this before? What is the average weight of quail in the North and East?—J. M. W. (Augusta, Ga.).

THE WHITE GOAT.—Victoria, B. C., Jan. 29.—*Editor Forest and Stream:* I have read with much interest the letters on white goat hunting, by J. W. Schultz, which appears in FOREST AND STREAM of Dec. 30 and Jan 6. Mr. Schultz has not taken advantage of the ignorance, which to a very great extent prevails respecting the mountain goat, and sacrificed truth for the sake of sensational "tall talk," but so far as my experience goes with this animal, he has painted it in its natural colors, and I take the liberty of thanking him for his indorsement of what Mr. Griffin and myself have written on this subject.—JOHN FANNIN.

BEARS AND BEAR DOGS.

I WAS much pleased to find in the FOREST AND STREAM a few lines from my esteemed friend, J. G. Rich, of Bethel, Me., in which he gives a brief sketch of his experience in bear hunting. May we entertain the hope that he will give us a full account of the days which he spent alone in the wilds about the Rangeley Lakes, especially in those cabins hid away in that lonely region, at the extreme end of the vast arm of Richardson Lake? It would have great interest for me, for I camped with him almost twenty-five years ago. I recall those long winter evenings when I sat by the camp-fire, thinking could those old logs speak what rich tales they would tell. Did he ever catch fur nearer home than we did that winter? We found that an old lynx was at the door nights after the crumbs thrown out from our meals, so we built a "cat house" at the shore a few steps away and caught the old villain, also a fine mink in the shed by the door. We had found he was stealing our trout, so we took him and had his skin stretched in less than an hour after setting the trap.

I wonder if "J. G. R." remembers how he lost a drink of tea by not smelling of the bottle, and thinking it empty because it was light. I will relate how this occurred, that no other hunter may be caught in the same fix and go without a drink when it can be had by the taking. One cold, wet night late in the autumn, on returning from our traps, we found our friend "J. G. R." at the camp very wet and tired, having come from the foot of the lake. He had been at the camp some time; said he had "exhausted all means to find our tea," knowing that there must be some there. There were a number of black bottles; how many times those were shaken I don't know, but the fact that they were well filled with tea was not discovered by our friend. Always smell in the bottles.

I agree with Mr. R. that a small dog will often stop a bear when the bear and dog can be got together, but when a dog has to follow a bear a long way into the dark swamps to come up with him, such a dog would be of no account. In following bears on the first snows it is as difficult to get near him as it would be to do so were he a fox, therefore good tracking dogs must be employed.

Our friend "Ursus" seems to think that a bear hunter has little regard for truth and only draws his bow to suit the game. Our friend "J. G. R." can tell if my brother or myself would be likely to tell a cheap lie. I understand why I was not believed; it is because he is a resident of Maine, where they do not believe a dog can stop a bear because such mongrels as they own will not do it. A good dog costs money. How can it be supposed that good dogs can be found in a community where, in a day's travel, not a person could be found that would pay over five dollars for a dog; and I think it safe to say that a blooded dog could not be found in a day's ride. I was laughed at for supposing that a dog could be found that could be depended on to stop a bear, but after much effort for several years I have convinced those skeptics that it can be done. I do not depend on one dog, but have taken the advice of my Southern correspondent and got dogs for tracking and dogs for fighting. I have one dog that can dodge a bear so as to escape its claws and in an instant be upon the bear again. Had our correspondent seen the froth upon an old she bear's back last fall, he would think the truth had been told fit for an honest hunter to read. I don't believe the story of "a bear with a lot of dead dogs around him." In over twenty-five years of hunting and travel among hunters I never knew of a dog being killed or disabled by a bear; will "J. G.R." tell us if he has such information, or can "Ursus" give us proof that one dog got killed or badly hurt? and tell us more about this great hunt, did they kill the bear? Who owned one of those dogs that got a broken back, and does a bear kill a dog every time he paws him?

A bear does not strike a blow sufficient to kill a lamb, as can be proved by a great number of wounded sheep and lambs, showing that they were cut through upon the sides by the claws; in all cases the claws did the work. The only dog I ever saw wounded by a bear had been clawed up and left with a sore back. In all cases the bear depends upon the cut of the claws, and only strikes to produce such an effect. Put a muffle upon the claws of a State of Maine bear and he might paw over a dog all day and not hurt the dog in the least. I don't think this would apply to a grizzly bear. They always attempt to fasten to their prey and draw them in toward them to enable them to use their teeth. Let us hear from others upon this subject. The bear is the only large game that can be hunted when you please and as you please. Fine sport can be had with good dogs among the bears. Mr. Haughton laughed last fall, when we went on a bear hunt, because some one took a rope to drag out the bear with. So upon returning with his colt that evening, he came leading the colt up the road with his handkerchief tied over its eyes, to "prevent it from seeing the bear." But you ought to have seen how cheap he looked when he saw a fine bear lying in the yard. He now has more faith in our way of taking bears.

Can any one tell me of one person in New England that ever made any special effort to hunt bears with dogs for that purpose, or ever tried different dogs? or did anything more than to try whatever curs they might chance to have? I lost much time fooling with hounds; they are lacking in courage. BRUIN.

SALEM, Mass.

SEAFOWL SHOOTING AT BERWICK.

THE ancient historic town of Berwick stands on the north side of the river Tweed, in what, in geographical strictness, ought to be the southeast corner of Scotland, but which legally and politically constitutes the northeast extremity of England, a portion of some nine square miles having been snipped off from its natural affinity and united by Act of Parliament to the southern adjacent country.

The town itself stands at the junction of the river Tweed with the German Ocean. The eastern wall of the ancient fortification, the inner rampart of which still remains nearly entire, though disarmed and partially dismantled, approaches within 200yds. of the edge of the sea-cliff, the base of which is washed by the waves every tide, and from the southeast angle of the cliff a substantial stone pier extends in a straight line 220yds. to the southward, when it turns off at a right angle and runs eastward out to sea some 800yds., and is surmounted at the end by a neat stone lighthouse. At the landward end of the pier the seacliff has a height of about 30ft., and from this point it rises gradually for about two and a half miles, when it culminates at Marshall Meadows in a precipice of 300ft. It then sinks again in a short distance to some 200ft. and maintains that average elevation for nearly twenty miles, when it terminates in the black and frowning precipices of St. Abb's Head, the eastern extremity of the vast mass of basaltic whin which forms the bleak and barren range of the Lammermuir hills.

These riven and contorted cliffs, at the base of which the billows of the North Sea beat incessantly, afford a refuge and breeding place to countless myriads of seafowl of various species—cormorants, razor-bills, puffins, guillemots and gulls, from the great blackback with its 5ft. of wing-spread to the kittyhawks of 30in. Besides these, hooded crows, jackdaws and rock pigeons have their special quarters, and in the most rugged and inaccessible recesses two or three pairs of peregrine falcons have established their aeries.

This iron-bound coast extends along the northern arm of Berwick Bay, while its southern arm is encircled by the low and sloping shore which, commencing a short distance south of the mouth of the river Tweed, sinks down into the oozy expanse of Goswick Sands and Fenham Flats, and terminates in the bold promontory of Holy Island or Sindisfarne, southward and eastward of which lie the Farne Islands and Staples Rocks, the scene of Grace Darling's heroic rescue of the crew and passengers of the wrecked steamship Forfarshire, in 1838. These islands are the resort in the breeding season of numerous gulls, terns and other sea and shore birds, and especially of that grand bird, the eider duck, at one time nearly extinct, but now strictly protected against the incursions of gunners and egg hunters.

Every day when the tide answers, the gulls leave their roosting places at St. Abb's Head to forage for their living, and while some of them troop off northward to the sands of Dunbar and the shores of the Frith-of-Forth, others wing their flight southward to their feeding places on Goswick Sands, Fenham Flats and Holy Island beach, returning in the evening to their homes on the Head.

To intercept these in their flight, the sportsmen of Berwick have made what they call "gull-holes" on the projecting points of the cliff, by digging on each a hole about 8ft. diameter by 4 or 5ft. deep, in which the shooter can crouch unseen by the birds until they come within killing distance. From these blinds gulls are shot at all seasons; but the principal time for enjoying this sport is during the months of August and September, when the young birds have attained their full size and plumage, and are able to accompany their parents in their flight to their distant feeding places. The most favorable condition is a breeze from the southeast with an ebb tide.

One evening near the end of August, 1884, having awakened rather earlier than usual, and not feeling inclined to sleep again, I arose, took my gun, a single barrel of 7lbs., 20-gauge, and sauntered along to the "Genesis" gull-hole, about a mile and a half from my dwelling. When I arrived there the sun was still below the horizon and his beams were irradiating the edges of a long low-lying streak of cloud which appeared to rest upon the extreme verge of the sea. The surface was as smooth as a mirror, only agitated by the faint ground swell which ever rises and sets in that stormy region; the tide was receding, and pretty well out. From my lofty perch, 100ft. above the water which rippled gently among the rocks at the base of the cliff, I looked out over the expanse of Berwick Bay and noted the flight of the solan geese passing along in strings of 8 or 10, their large white bodies close to the surface, their long necks stretched out straight before them (whence their local name of poker-necks) and their black wing-tips ever and anon dipping in the brine. A few solitary gulls, well out to sea, were winging their deliberate way southward, and two or three of a smaller species kept hovering and circling

about the edge of the rocks, occasionally alighting on the water to pick up a fragment of food, and rising on the wing again to look for more. I stood thus watching the spread of light as the sun rose higher and higher above the horizon, and his rays illuminated in succession Berwick pier and lighthouse, the sands of Spittal point and beach, the links of Goswick and the castles of Bamborough and Holy Island, until my watch pointed the hour of seven, and the bell of the town clock boomed out its solemn confirmation, and I was beginning to think of home and breakfast, when I observed a dark line creeping up the glassy surface from the southeast, the harbinger of the wished for "gull wind," and soon the smooth water between my stand and Holy Island became streaked with the "catspaws" which precluded the coming breeze.

While thus watching the advance of the wind, which began to fan my cheek in intermittent puffs, a shadow crossed the point in front of me, and looking up I saw a large gray gull hovering within 30ft. of my head. To seize and pitch my gun was but the work of a second, and the bird fell, dead shot, and lay upon the sloping turf at the edge of the bank. I was undetermined whether to load up again or to pick up my bird and walk home, when casting my eyes to the northward I observed a wavering line of white objects following the sinuosities of the shore. I made all haste to reload, and was just in time to meet the first of the line with a charge of No. 4 shot, and I continued shooting until sixteen large gulls lay dead within a space of ten yards square, and my gun became so hot that I dared not put another charge of powder in. All these birds took the inland side of my hiding place, and were all shot within twenty yards of the gun muzzle, and with the first one killed made seventeen killed without a miss.

By this time the whole of the first flight had passed, and other companies coming I soon secured all I wished, so picking up half a dozen birds, as many as I could conveniently carry, and giving the remainder to a party of fisher women and children, who had been gathering bait from the rocks to the northward, I started for home and breakfast with a light heart and a heavy burden.

These birds are chiefly valued for their feathers, the flesh of the old ones being tough and fishy; but the breasts, wings and legs of the young ones, laid over night in salt and water, and made into a pie with a piece of pork or beefsteak, make a dish by no means unworthy of the attention of a gourmand. S. D.

BELLEVILLE, Ontario.

WINTER IN CAMP.

Editor Forest and Stream:

I have eaten my supper and put the camp to rights. A furious storm is raging without, but with a cheerful fire the camp is cosy and I am prompted to give you a screed.

With the fading of the leaves I began to experience longing for the woods, and one Monday morning in September I started with a crew from the last settlement on the east branch of the Mattawamkeag for its headwaters to build a camp. The route was by old, disused logging and tote roads, and required a great deal of swamping out; so that it was nearly dusk when we reached our destination and pitched the "Nessmuk" tent, and made snug for the night. The spot was on a bank of a cold spring brook, and a noted runway for caribou. At the end of the week a nice camp of peeled logs 10x12ft. inside, with a wood shed annex of the same size, was, except some inside work, completed. October 1 I started in with a span of horses and a jumper loaded with my winter's provision, such as flour, pork, beans, onions, codfish, molasses, sugar, tea, canned goods and other condiments. I expected to find plenty of game, but experience had taught me that one cannot live on game alone for any length of time. For a few days at first, by cooking in several ways, one can live almost wholly upon it. After that an occasional meal is all that is desired. After fitting the inside, banking the outside with earth and boughs, with a deep layer of boughs on the roof, I put in my time in pleasant weather fitting and piling my stock of wood which I had cut sled-length and hauled up while having the team. I don't like the plan of cutting from day to day as needed, and wallowing waist deep in snow, green wood at that. But that is the way with most hunters. With a good stove and plenty of dry, hard wood, I can laugh at the rigors of this coldest of winters. A fire is seldom kept up later than nine o'clock evenings, yet the vegetables have not been chilled.

My lines of traps are not extensive, owing to my lameness, a legacy of that little "picnic" down in Mexico in '46-'48. I have shot two caribou near the camp, and seen a dozen or more handy by that I could have shot if so disposed. But those I got were all I could use, and there is yet enough of the meat to "spring out" on.

A few hunters from the settlement have made brief calls and brought my mail, among which is the highly prized FOREST AND STREAM. I have always been a reader of the paper, but never with so much pleasure as this winter. I might have had a camp mate, but, like Daniel Boone, I like camping by myself; besides, a long winter in camp is trying to dispositions. So, too, there are many sportsmen in the cities who would jump at the chance and pay well for a home in my cozy camp and a crack at the caribou. But I am not "built that way." Sixty winters have frosted my head, but have not chilled in me the least my love for a hunter's life. WARFIELD.

CAMP CARIBOU, Aroostook county, Me., Feb. 4.

RIFLE SIGHTS. — *Editor Forest and Stream:* For several years failing eyesight, incident to old age, has made it extremely difficult to get satisfying aim even on large game. My near sight is a "buckhorn," and the sides of the semicircular disk caused a blurr. I have filed off the horns level, and a little of the V-shaped notch, and cut down the bottom with a flat, square-edge file as was recommended by a writer a few years ago in your columns. The improvement is great.—WARFIELD (Camp Caribou, Aroostook Co., Me.)

NOTES FROM SOUTHWESTERN GEORGIA.—Bainbridge, Ga.—Deer, mink and otter are found here, and I am informed that the beaver is yet occasionally met with. Quail are very abundant in the pine woods, and as one can ride anywhere among the trees, afford a convenient game. The wild turkey is also met frequently in these splendid woods. Rabbits so abound that they have become a nuisance to settlers.—EDWARD JACK.

MONTANA NOTES.

BOZEMAN, Mon., Jan. 20.—Montana Territory is having an unusually heavy dose of winter weather, and cattle are having a wretched time on the range, with nothing but sage brush and snow to live on till a chinook comes to their relief. The deer will not suffer while they have rose brush in plenty, and the same is true of the grouse. A few mallards winter here on the West Gallatin River, which never freezes, on account of its great swiftness; and the little water ouzel, too, braves the cold wherever open water is to be found.

Following the good example of the bear, my partner and I have "holed up" for the winter, and FOREST AND STREAM adds very materially to our enjoyment.

One of the principal trespassers of the Crow Reservation stopped at our "shack" last night, and, visitors being rare, we talked till late at night on matters national and territorial. Most, indeed all, the cattle that were on the Reservation when the order of evacuation and destruction was issued will winter there, as they have for several winters past, being taken off in the spring as formerly. A show of rounding up and driving off of the stock was made, but the stock men found that ice had already formed along the sides of the Yellowstone, and the cattle refused to enter it. If forced into the river, the ice on the opposite side would have prevented their climbing out, and they would simply have drowned. To drive them into the mountain, on the south of the Reservation, would have been equally impossible in the winter, so they concluded to turn the cattle loose again and take chances.

Some buildings and corrals were burned, some were not. Those of Nelson Story, another of the trespassers, escaped from their being just without the boundaries, his cattle, however, range on the Reservation all right enough.

It is true enough that what few cattle the Crows own would, if they were driven in at round-up time with cattle belonging to white men, be immediately claimed as mavericks (unbranded cattle) and marked with the brand of the finder; but, on the other hand, the Crows levy a very considerable tax by the surreptitious killing of a fat beef whenever they want it, and also get considerable beef from the carcasses of cattle killed by the railroad. In such cases the animal is killed by the railroad employees, or rather they hire some Indian to do it, as the railroad company has the hides of such animals sent to St. Paul that the brand may be proved; the beef is claimed by the Indians.

Few cattlemen would object to the Indians' killing now and then a beef, if all the meat be taken and none wasted. It is the finding of a fat steer with only a sirloin or part of a ham taken, which is often done by predatory bands from the North, that arouses the cowpunchers' ire, and the determination to make "good Indians."

IPSARRAKA.

NEW YORK LAW.—At the last meeting of the New York Association for the Protection of Game, President R. B. Roosevelt read the amendments to the game laws, which will be sent to the Legislature. The amendments provide that game birds may be sold until Feb. 15 and venison until March 1. They forbid the hunting of deer from Nov. 1 to Aug. 14; the killing or having or selling of wild duck or goose or brant from April 1 to Aug. 31; of quail, robin, meadow larks or rabbit from Jan. 1 to Sept. 30; of partridge, pinnated grouse, or Canada partridge from Jan. 1 to Sept. 30; of woodcock from Jan. 1 to Sept. 30; of black or gray squirrel from Feb. 1 to July 31. Every offense is punishable by a fine of $25. The only summer shooting under the new laws would be woodcock in July. Protection will also be given to trout of the brook, speckled, German, California and brown varieties from Sept. 1 to Feb. 28, except in the Adirondack preserve; to lake trout and salmon trout from Oct. 1 to March 31; to muskallonge, Oswego bass, black bass, pike, perch, wall-eyed pike and fresh-water striped bass from Jan. 1 to May 20. Each violation of these laws will entail a fine of $10. The Fishmongers', the Gamedealers', the Marketmen's and the Hotel associations approve all the proposed amendments. The association decided to ask Governor Hill to remove George W. Whittaker, game constable in Suffolk county, for incompetency. —*Times, Feb. 15.*

DAVY CROCKETT'S STAMPING GROUND.—Dyersburgh, Tenn.—This is the finest country for field, forest and stream sport that I ever saw. It seems to be no trouble in our beautiful dry Indian summer weeks for the sportsmen to find all the game they wish. You can take all the fish in the lakes and bayous that any heart could desire. Parties bring them to town in wagons, on horseback and some come carrying them. Deer are brought in in the fall. The part of the country here, where deer, bear, wild hogs, turkey, etc., are the most abundant is the Mississippi bottoms. The timber is mostly cottonwood and cypress, though sometimes a dense forest of hickory may be found, the latter is found on what is known by the natives as ridges. The white sand is found in the lowest parts of the bottom and is literally roofed in by large tall cypresses, which grow close together and form a dense forest. Here is where the turkey hunter loves to saunter, and it is needless to say that deer and bear are plentiful. Not far away, over toward the Mississippi, was Davy Crockett's stamping grounds, where he hunted for a number of years. Not long ago a party of us went by what is known as Davy Crockett's camp. We found the marks of his existence very dim; nothing but the sign of his chimney remains.—T. T. P.

THE IDEAL MANUFACTURING CO., of New Haven, Conn., makers of reloading tools for rifles, pistols and shotguns, have had the misfortune to be visited by fire. Luckily, however, their damage was confined mostly to a wetting down, and a few days will suffice to put them in complete running order again. They are to be congratulated on their fortunate escape.

ENLARGEMENT.—Messrs. Von Lengerke and Detmold, of this city, dealers in general sporting goods, announce that owing to an increased business which has outgrown their present facilities, they will move on the 1st of May to larger quarters on the ground floor of No. 8 Murray street.

THE TRAVELERS, of Hartford, Conn., issued 2,426 life policies in 1884.—*Adv.*

AN ANALYSIS OF THE TRAJECTORY TEST.

Concluded from Page 9.

THE MEAN TRAJECTORIES.

I WILL next consider the mean trajectories as I find them laid down in the tables in your pamphlet report, also in FOREST AND STREAM. I will consider them in the order of their merit for flat trajectories as established in your report.

No. 1.—MERRILL'S .42-100-213, ratio 1:2.13. Wind 18m. per hour. Theoretic fall of ball 5.224in.

Yards.	0	25	50	75	100	
Height of Traj's	.0	+1.130	+1.506	+1.273	+0	
Negatives	—.66	—.495	—.33	—.165	—0	
Errors	—.66	+.635	+.976	+1.108	—0	
Semi-diam. ball.	—.21	—.21	—.21	—.21		
Reduced errors.	—.45	+.425	+.766	+.898	+0	from the L.S. to the cut of bullet.

Above we have the heights of trajectory; the + sign shows that they are above its base. Next below are the negatives; the — sign shows they are below the line of sight and are to be subtracted. Next comes with the — and + signs the vertical trajectory errors or measurements for "accuracy," from the line of sight to the trajectory. And last is the semi-diameter of bullet, which is to be subtracted to get the "reduced errors". After these the rifle misses.

No. 2.—BLAND'S .45-110-275, ratio 1: 2.50. Hollow pointed express bullet. Wind 12m. Theoretic fall of ball 5.865in.

Yards.	0	25	50	75	100
Height of Traj's	.0	+1.257	+1.466	+1.304	+0
Negatives	—.66	—.495	—.33	—.165	—0
Errors	—.66	+.762	+1.136	+1.139	+0

The Bland rifle shot with great power and force. Compare the height of trajectory with the Merrill trajectory.

Second trial, rifle not cleaned. Wind 12m. Theoretic fall of ball 5.336in.

Yards.	0	25	50	75	100
Height of Traj's	.0	+1.175	+1.334	+1.223	—0
Negatives:	—.66	—.495	—.33	—.165	—0
Errors	—.66	+.680	+1.004	+1.118	+0

This trajectory is virtually the same as the Merrill.

Third trial, solid ball, 110-310, ratio 1: 2.81. Wind 23m. Theoretic fall of ball 5.040in.

Yards.	0	25	50	75	100
Height of Traj's	.0	+1.052	+1.410	+1.283	+0
Negatives	—.66	—.495	—.33	—.165	—0
Errors	—.66	+.557	+1.080	+1.118	+0

This trajectory at 50yds. is only 1-10in. higher than the Merrill one. I happened to have this rifle in my possession when the FOREST AND STREAM announced its purpose to have a rifle test, and the makers consented to have it entered. It was very kindly sent to me to test its trajectory, for I had ascertained that its trajectory and the Holland trajectory of the English trial were crooked, alike wavy and unnatural, and I desired to find the cause of it. As I was an entire stranger to Bland & Sons when they shipped me the rifle, it shows they had confidence in me and their rifle.

No. 3.—REM.-HEP., .32-40-120, ratio 1:3.

Yards	0	25	50	75	100	
Height of Traj	.0	+1.468	+1.803	+1.525	+0	
Negative	—.66	—.495	—.33	—.165	—0	
Errors	—.66	.973	1.473	1.360	0	Th. fall, 7.212in.
Merrill errors	—.66	.635	.976	1.108	—0	Th. fall, 5.224in.
Merrill beats	—.0	+.34	+.50	+.252	+0	1.988in.

And this, remember, is the flattest trajectory of all the 31 American breechloaders tested. A beat of .50 in 1.47, about 33 per cent., and almost 2in. in the fall of the ball.

No. 4.—BULLARD., .50-115-350, solid ball ratio 1:3.04. Wind 18m.

Yards.	0	25	50	75	100
Height of Traj	.0	1.598	1.817	1.957	—0
Negatives	—.66	—.495	—.33	—.165	—0
	—.66	+1.103	+1.487	+1.492	+0

Th. fall, 7.268in.

The muzzleloader beats this rifle, as will be seen, a little more than it did the one above.

Same rifle, .50-115-300, expl. ball, ratio 1:2.61. Wind 15m.

Yards.	0	25	50	75	100	
Height traj	0	1.690	2.047	1.873	0	
	—.66	—.495	—.33	—.165	—0	
Errors	.66	+1.195	+1.717	+1.713	+0	Th. fall, 8.188in.

The muzzleloader beat the Bullard with the express bullet considerably more than it did with the solid one. Notice the difference in the fall of the bullet for the range, as well as the ratio of powder to lead in the charge. Do this as you proceed through the rest of the 31 trials.

I have omitted to state in the proper place that — (minus) .66 shows that the trajectory or bullet starts from below the line of sight. See the diagram to explain this.

No. 5.—BALLARD, .40-85-370, ratio 1:4.47. Wind 11m.

Yards.	0	25	50	75	100	
Height traj	0	+1.708	+2.061	+1.821	+0	
Negatives	—.66	—.495	—.33	—.165	—0	
Errors	—.66	1.213	1.751	1.656	0	Th. fall, 8.244in.
Merrill	—.66	.635	.976	1.108	—0	Th. fall, 5.224in.
Merrill beats	0	+.578	+.755	+.448	+0	—3.02in.

This trajectory is in the diagram. At 50yds. the muzzleloader beats in less error, or in accuracy, as string .976 is to string 1.751; and the theoretic fall of its bullet for the range is over 3in. less (3.02).

No. 6 Marlin .45cal. shot wild; ruled out, not reliable; "only 1 shot in 25 rounds," says the report, "hit all the screens and the target." Heights, 1.161—2.12—1.61—0—one shot only.

No. 6.—MARLIN .32-40-165, ratio 1: 4.12. Wind, 10m.

Yards.	0	25	50	75	100	
Height traj	0	+1.773	+2.128	1.868	+0	
Negatives	—.66	—.495	—.33	—.165	—0	
Errors	—.66	+1.278	+1.798	—1.703	+0	Th. fall, 8.512in.

No. 7.—MAYNARD., .40-70-240, ratio 1: 3.40. Wind, 18 miles.

Yards.	0	25	50	75	100	
Height of Traj	0	+1.758	+2.155	+1.895	—0	
Negatives	—.66	—.495	—.33	—.165	—0	
Errors	—.66	+1.263	+1.825	+1.730	+0	Th. fall, 8.620in.
Merrill	—.66	.635	.976	1.108	+0	Th. fall, 5.224in.
Merrill beats	—.0	+.628	+.849	+.622	+0	—3.395in.

This curve is in the diagram. The muzzleloader beats it in less error or greater vertical accuracy at 50yds. as .976 is to 1.825 or nearly as 2 to 1; and in the less (theoretic) fall of its bullet by 3.4in.

I should have before stated that the fall of the bullet in air is a little more than the theoretic fall in vacuum.

In all 33 cases or shots the line of fire or axis of the bore practically points above the point blank PB on the target, a distance a little greater than the theoretic fall of the bullets as we give them.

No. 8.—BULLARD .40-70-230, ratio 1:3.30, wind 18m.

Yards.	0	25	50	75	100	
Heights of traj's	.0	1.740	2.157	1.888	0	
	—.66	—.495	—.33	—.165	—0	
Errors	—.66	+1.245	+1.827	+1.723	—0	Th. fall, 8.628in.

No. 9.—WINCHESTER .50-95-512, ratio, 1:3.28; wind, 18m.; shot No. 3 out:

Yards.	0	25	50	75	100	
Height traj	0	1.740	2.203	2.210	0	
Negatives	—.66	.495	.33	.165	0	
Errors	.66	+1.245	+1.873	+2.045	+0	Th. fall, 8.812in.

No. 10, BULLARD .45-85-290; ratio, 1:3.40; wind, 11m.

Yards.	0	25	50	75	100	
Height traj	0	1.791	2.210	1.891	0

But it is the beat at 50yds. and the heights of the mean trajectories at 50yds. which, under the test, we must consider mainly.

FALL OF BULLET FOR TEN YARDS.

The following shows the fall of the respective bullets from the respective lines of fire for the first 10yds. in the 100yds. range at the FOREST AND STREAM trial for trajectories, 1885. They are deduced from the practical heights of the several trajectories at mid-range, as laid down in the report. The falls of bullets are in decimals of inches. The Merrill rifle only is a breechloader:

Nos.	Rifles.	Calibers.	Fall Ball.	Parts of 1 in.
1	Merrill-Phillips.....	.42.....	.0522	1-20in.
2	Bland, Bland, English.....	.45, three trials.....	.0536	1-20in.
			.0564	1-16in.
			.0586	1-16in.

29	Remington.....	.32.....	.1587	1-6in.
30	Winchester.....	.32.....	.1684	1-6in.
31	Stevens.....	.22.....	.1798	1-6in.
32	Wesson.....	.44.....	.1809	1-6in.
33	Steven's Hunter's Pet	.32.....	.1982	1-5in.

The different falls of the bullets at 10yds. are as the respective heights of the curves at mid-range. Example, take the two extreme cases, the Merrill and the Steven's Hunter's Pet rifles, we have

.0522 : .1983 :: 1.406H. : 4.955H.

where $\frac{.1983S}{.0522M} = 3.797$ and $\frac{4.955\ S.\ H}{1.306M.H.} = 379$

Ratio, as 1 to 3.79=Ratio as 1 to 3.79.

We also have .0522 : .1982 :: 1 : 3.797. Inversely, the Merrill velocity of bullet is represented by 3.79 and the Stevens velocity of bullet is represented by 1, thus giving a rate of 5¾ miles speed for the Merrill rifle to 1 mile for the Stevens. The powers and effectiveness of these rifles are about as an 8 years old boy is to a fully matured man. Query—Is this one of Mr. Burns's 27 breechloaders which beat in accuracy the Merrill rifle?

SUMMARY.

1. Flatness of Trajectory.—The Merrill muzzleloader beat, and very badly, too, all the 31 American breechloaders at 50yds., to wit, it beat them all in the flatness of its trajectory, all the way from 38 per cent. as the least (Rem.-Hep. .32) up in graduation to 273 per cent. as the greatest (Stevens Hunter's Pet .32) as we have proven.

2. Velocity and Power.—As the heights of the Merrill, the Rem.-Hep., and the Stevens Hunter's Pet, may (without violence) be taken to represent adversely (but not directly) the velocities of the bullets which made them, also the power of the rifles, we have in this case the Merrill velocity of bullet and power of rifle, 38 per cent. greater than the Rem.-Hep., and 278 per cent. greater than the Stevens Hunter's Pet.

3. Trajectory Accurracy.—The muzzleloader beat, and very badly, too, in trajectory accuracy, all the 31 American breechloaders at 50yds., viz.: it beat them from ⅛in. (Rem.-Hep.) as the least, all the way up in graduation to 3.70in. as the greatest (Stevens Hunter's Pet) and from 50 per cent. as the least beat up to 379 per cent. as the greatest.

4. Individual Shots.—The muzzleloader beat in trajectory accuracy and power at each of its 5 shots, each and all of the 155 individual shots of the 31 American breechloaders (as has been proven).

5. This case is very plain, and the proof overwhelming. Neither the lessons of your report nor its integrity shall be denied, perverted or traduced by designing persons. It was a gift from FOREST AND STREAM to its readers, and of great value to the public.

Please to regard my muzzleloader merely as a text in this case, and not as a weapon that requires any defense at my hands. I trust and believe that the great majority of your readers will fully appreciate my feeble efforts in this article to try and advance the cause of truth and rifle shooting. If so, my purpose will be met and myself richly rewarded. I sent it forth greeting, with the kindly compliments of the season to all brother sportsmen everywhere.

MAJ. H. W. MERRILL.

NEW YORK, Dec. 25, 1886.

Editor Forest and Stream: Please make the following corrections in my artitle "An Analysis of the Trajectory Test" in your columns of Dec. 27: Par. 10 (The right), for "it" read "its" (height), 2d line. Par. 14 (Near point), 2d line, for "N H P" read "N P B." Par. 15 (The error), 4th line, for "N B P" read "N P B." Par. 18 (With), 1st line, for "the" read "these," after "can" read "now." Par. 19 (We will), 1st line, for "introduce" read "explain." Par. 21 (A flat), 1st line, after "has" insert "but." Par. 27 (All), 1st line, for "the circle" read "4 circles." Par. 36 (Now these) 11th line, after "accuracy" read "50 per cent." or ".50 of an inch." Par. 37 (Note well), 1st line, after "inch" read "or fifty per cent." Par. 40 (Perhaps these), 3d line, for "bodily" read "boldly." Par. 43 (Table I), 2d line, for "negatives" read "negative." Par. 45 (Table 2), 3d line, under "negative" insert "errors +." (Table 7), 3d line, under "negative" insert "errors +." (The diagram), 4th line, erase "about one-third," and after "by" read "38 per cent. in trajectory power, and 50 per cent. in trajectory accuracy." Summary—Par. 3 (Many suppose), 3d line, after "less" read "that." Par. 12 (Question 5), 2d line, for "made" read "done."—H. W. M.

Sea and River Fishing.

Address all communications to the Forest and Stream Pub. Co.

FIVE DOLLARS A POUND.

THERE is trout fishing, and fishing for trout. Trout large and trout small. Trout to be caught from a boat in deep water, and trout to be waded for. But the kind of fishing which tells is that which is found in our smaller mountain streams. There is no aristocracy about it, except the fish, and they are generally small enough to belong to that exclusive class. If one did not know, as he travels through these mountain passes, he would never think of looking in these little streams for anything large enough to get a hook in its mouth; but there is scarcely a stream of any size, provided it has not had its fish destroyed, which is not alive with these active little beauties. Unfortunately for one who loves the sport there are so many others who are of the same way of thinking that the streams are whipped continually from the opening to the close of the season, and from the spring from which they start to where the water becomes too warm for them. The water is always cold, and in order to come any speed one must seek the head of a stream and wade it to its mouth. It goes all right at first until the continual application of the icy water has extracted all the animal heat from one's feet and legs, and then it becomes rather monotonous unless the fish are so lively as to make one forget his lower extremities. Rubber boots are all right if one can stand on his feet, but when he gets tired, when he strikes a slippery rock and lies down for a rest, or to get a new start, or when he takes a premeditated header into some deep hole to see if there are any fish there anyway, his hip boots are useful to carry a supply of water for which he is not apt to find any special use.

I had made several of these excursions which were so delightful—to tell about when the discomforts were things of the past, and suppose I must have painted the pictures in tolerably bright colors when relating them to a particular friend with whom I had camped two seasons when we fished for bass in Canada. You know how it is. You do not intend to go into the Annanias business, but there is all the difference in the world between the actual experience and the most truthful statement of it afterward. The hardships are all forgotten and the remembrance of the pleasure alone remains. So it must have been in this case. I received word from him that he would come up some time and have me initiate him into the mysteries of this most aristocratic sport. I put him off for a time, hoping to get away from business long enough to hunt up some stream where there were some trout which would be a little longer than one's finger, before he should come. While I was trying to get away, he wired me that he could get off the next day and would meet me on the train in the evening. As I was in for it, hit or miss, I concluded to take him to a stream where I had never been myself, and run the risk. We met on the train in the evening, and I found he had bought a bran new trouting outfit.

We reached our destination all right, and put up at the hotel for the night. When we went out in the morning the rain was pouring down as if it meant business. And it did, for it kept it up all day. After getting directions we started for the stream. It was not long until we came to it, but when we tried it we caught only chubs. Of course we then knew that we must get higher up where the water was colder, for those streams always have chubs below the trout limits, and the two are often

found in the same part of the water where the trout begin to thin out. Looking ahead we discovered a break in the mountains, and concluded that, as the stream must come down through it, we would take a near cut and thus save time. No sooner said than we commenced to work our way through the thickets in that direction. When I tell you that nature had sowed that stretch of mountain with locusts, and that they stood as thick as the hairs on the proverbial dog's back, and that they had an unusual number of thorns on them, and that they were moist and getting wetter, and that every time we stooped to get through the tangle something poured water down our necks, you will begin to understand the felicity of the trip. And when we did at last get there, we found the hollow as dry as a bone. There was no stream, and never had been one there. It was now about noon, and our train was due at five. Not satisfied with our recent experiment, we concluded to take our way over a spur of the mountain to where we knew the stream must be; so off we went. It was tolerably smooth going for a while, and we were congratulating ourselves on our good luck, when just as we struck another thicket of locust and greenbriers, a mountain fog came down on us. We could see about ten feet away, just far enough to see nothing. We took our bearings by the compass and went ahead. About two o'clock we raised a shout of triumph, for we were out of the woods, and on the long lost stream. We had no time to go up and fish down, so commenced casting with bait and flies as we waded up. After going a hundred yards I caught something. It was so gloomy, and the fish was so small, that it required close inspection to prove that it was really a trout. When I had made sure of this, and had located the spots so as to be able to point them out to one who had never seen a spotted beauty, I called to the Doctor to come and view the game. He hurried to where I was standing and after looking at it a long time he said: "And that is a trout? Well, by George!" I assured him that it was a veritable specimen of that celebrated fish, and that this was the place and the usual method of capturing them. We fished as long as our time would allow, catching a dozen or two; then struck out for the station and boarded the train for home.

When we came to the station where I had to leave the train, the Doctor handed me his new fishing kit, saying that he was glad he had been fishing for trout, and while he had not caught many, they were enough to last him a lifetime. Two days after he wrote me, saying he had counted the expense, and they just cost him five dollars a pound; but counting the experience, he thought they were cheap at that. HOMERUS.

SURFACE SCHOOLS OF FISH.

Editor Forest and Stream:

In your issue of Feb. 10, under the caption "Surface Schools of Trout," J. H. Way says that "on Moosehead Lake, Me., trout of all sizes appeared near the surface," etc. "Spicewood" *idem* says he saw "a large school of fish and * * * found them to be trout." He also says that these fish all refused the fly, although cast with great caution, but that he succeeded in hooking one in the back, but does not say whether he landed the fish thus accidentally fastened.

Will you permit me to hazard the opinion that these fish were not trout at all, but some other species of the finny tribe. My partner and myself had almost precisely this same experience two years ago in fishing Fletcher Lake in the Muskoka district, or rather about fifty miles to the northeast of the Muskoka lakes. These fish appeared in large schools early in the morning and late in the evening over the deeper portions of the lake at some little distance from the shore. They seemed to be playing, not feeding, and refused both fly and bait. We were unable to procure a specimen, notwithstanding various efforts to that end. But we came to the conclusion that these fish were not trout, but what are known among the settlers in that country as herring. These fish frequent the deep water during the summer and only approach the shores at the beginning of cold weather in the late autumn, when they are caught in nets and, after curing, packed away for winter use. The fact that "Spicewood" caught trout "with a long line trolling deep" where they went down is by no means conclusive evidence as to their identity with the fish seen swimming on the surface. If the latter were herring they would have paid no more attention to the troll than to the fly, but large trout lying in the same water would have responded to the troll precisely as they did with us, under like circumstances.

JAY BEBE.

TOLEDO, O., Feb. 12.

Editor Forest and Stream:

In the summer of 1878, while at Plumador Pond, I often noticed surface schools of trout. When first noticed the guide told me there was no use fishing either with bait or fly, and that that was the only place he had ever seen them act so. As I remember now the trout acted in this way on sultry afternoons; they would appear in the middle of the pond and roll along a short distance, like porpoises, except they never showed their tails. I was on the pond for a week to ten days, and, perhaps, saw them four or five times. In the morning there would be fair fishing, but by 4 or 5 P. M. the trout would rise and I would not attempt to fish in deep water but would try at the outlet where I could get enough small fish for supper.

The reason for their rising in this manner I can't explain, unless it was on account of an approach of a thunder storm, for the last days of my stay there were accompanied with a violent storm. In the schools there could not have been more than six trout, but I noticed some five or six schools about the same place.

EDWARD BROOKS.

Editor Forest and Stream:

Twenty years ago I often went to the Adirondack lakes for trout in the spring, and camped on Tupper's Lake. I have seen on this lake when still, just at sunset, acres of trout playing with backs and tails out of water, and neither fly nor worm would tempt them. They would stay up about ten minutes and come within 20ft. of the boat if I kept still, but at the least move or noise on the water would fly, but they would soon return to the surface again. In those days there was no trouble in catching all the trout we wanted, and we returned hundreds that we gave an airing just for fun. D. W. T.

MARLBORO, N. H.

THE DEATH OF MR. FRANCIS FRANCIS.

FEW who then belonged to the great brotherhood of anglers, and who still live, have forgotton the wave of sorrow that swept over the fraternity when it became known that Thaddeus Norris had gone to his eternal rest. Not only to those personal friends to whom his genial nature had endeared him, was this confined. Thousands who had never heard his voice and to whom his personal appearance was but a picture of the imagination—all who had ever read "The American Angler," felt as though a dear personal friend had gone from them forever.

A similar misfortune has befallen the anglers of Great Britain, and American anglers will not be slow to extend their sympathy. Indeed, the loss is ours as well, for the beneficial effects of Francis Francis's life-work were by no means limited by the Atlantic.

Though a voluminous writer, it is his "Book on Angling" which has done most to endear him to the many who will mourn him in this country—a book which is, and will continue to be, a land-mark in the literature of angling second to none in prominence.

Angling may be said to be practically confined to the English-speaking Peoples. As the passing years mark the progress of the art, its votaries, born under whatever flag, should draw closer and closer together in sympathy, and recognize in a common love a common bond of gentle good-fellowship and union. Such I believe to be the fact. It is fitting, therefore, that in a case like this—when every English angler is mourning the death of Mr. Francis Francis—that we American anglers should not only feel, but should also express our sympathy.

With him who has departed is now "that peace which passeth all understanding." His is the gain. But to those whom he has left behind, only the kindly hand of time and the hope that the parting is not forever can bring consolation. But if present consolation be impossible, it may still be some gratification for them to be assured that the value of his life-work is widely recognized, and that he won the affection and respect of thousands and thousands of his fellow-men who never saw his face—in the New World as well as in the Old—in the Southern as well as in the Northern Hemisphere.

HENRY P. WELLS.

NEW YORK, Feb. 1, 1887.

BLACK BASS IN THE MOHAWK.—A correspondent of the Albany *Argus* writes to that journal as follows: "We should expect to find the black bass in abundance, or large size and gamy in such a river, and this is a fact. For years the river has been known to be very productive, those who have fished in it by scientific methods pronounce the fish of large size, full of fight, and reasonably plentiful. The extent of the river is sufficient to furnish all the fishing that anglers in its neighborhood could ask for. I have recently made some investigations, and I find that throughout nearly its entire course it has been infested with nets. Along nearly its entire course are men who live by trapping the bass in nets, and peddling them about the country. There are men who openly defy the law, and say they will fish opposite their property anyway. There are others who do it slyly, watching the movements of the proper officers. As soon as the ice is out of the river in the spring, hundreds of nets go into the river. So flagrant and great has been the abuse of the law that even in winter when the bass are sluggish, holes are cut through the ice, nets are put in and the fish are captured in their dormant state. There is no means of judging, but it is well known that many tons, possibly amounting to a hundred tons, are each year taken in nets. The country fish peddler can be found throughout nearly the entire valley of the Mohawk, summer, fall, winter and spring. Only last week two negroes were arrested and fined in Schenectady and three nets secured and destroyed, in which were found six large bass. There is not a mile of the river that is not poached upon during the entire year. Men too lazy to do anything else, openly defy and violate the law, getting a meagre living from their murderous work. A river which extends a distance of one hundred and fifty miles presents three hundred miles of shore. It is very nearly equivalent to a lake three hundred miles around. Of course a lake would have shoals at a distance from its shores, occasionally, and there would be islands, but practically the Mohawk River is equivalent to a lake from two to three hundred miles around, as far as its adaptability to black bass is concerned. The protection of such valuable water as this has been almost entirely neglected. If we had a lake of vast size in our neighborhood, it would most assuredly be protected. In recent years the Anglers' Association of the St. Lawrence River has, by its efforts, driven the netters away. The Eastern New York Association should do the same with the Mohawk. It will in a very short time give lovers of the rod and line all the sport they ask for. It is not a question of chance, but it is a fact that, if the nets can be kept out of the river, black bass will be found in great abundance. It is the intention of the Eastern New York Association to take vigorous measures during the coming season and to drive the netters away from the rivers, and compel them to seek other means of livelihood. All persons interested in angling, in outdoor life, or in a pastime which gives prosperity where it exists, and health to those who indulge in it, should give the association their influence as members, thus adding to the funds necessary in carrying out the work."

LANDLOCKED SALMON.—*Editor Forest and Stream:* I did not receive satisfactory answers to my note in your paper about this fish. I will now try to be more explicit. There is a fish in the Lake Superior waters called by the natives the red trout, or landlocked salmon. It is not the common lake salmon or salmon trout. The fish I mean is, to look at, very much like the salt-water salmon, *Salmo salar*, and its flesh is quite pink. On the table I think this fish is quite equal to the *Salmo salar*. What is the name of this fish? Is he the landlocked salmon, if not, what is he? He grows to a size of 30 to 40lbs. Your readers must not confuse this fish with the common lake trout whose flesh is white. Can any of your readers give me the name of this grand fish and say whether or not he will take the fly?—L. H. SMITH (Strathroy, Ont.).

THE LONDON FLY-FISHERS' CLUB.—At the annual meeting, in January last, the secretary announced that the club now numbers over two hundred and seventy members, and has over five hundred dollars in the treasury. Arrangements for house dinners and the reading of papers were discussed, and several interesting papers were promised for the meeting following the dinner on March 3. The former committee were re-elected, the vacancy caused by the death of Mr. Francis Francis being filled by the election of Mr. W. Pingo Horton.

THOUSANDS are born with a tendency to consumption. Such persons, if they value life, will not permit a cough or cold to become a fixture in the lungs and chest. The best known remedy for either is Hale's Honey of Horehound and Tar. PIKE'S TOOTHACHE DROPS cure in one minute.—*Adv.*

Fishculture.

THE UNITED STATES FISH COMMISSION.

THE volume before us is Part XII., Report of the Commissioner for 1884, and is, like its predecessors, a bulky work filled with information of various kinds. These reports are valuable, not only to fishculturists, but to the practical fisherman engaged in any branch of the commercial fisheries, as well as to the zoölogist. The report proper is divided into two heads; an inquiry into the decrease of food fishes, and the propagation of food fishes in the waters of the United States. Under the head of inquiry are prosecuted researches, not only into the habits and characteristics of the fishes themselves, but into their general relationship to each other and to man; the statistics and methods of their capture; the influences exerted upon their movements by physical and other causes; and in short, whatever information is necessary for a satisfactory and proper treatment of the general subject. Among the noteworthy points which have engaged the attention of the Commissioner during the year are: The vigorous prosecution of the work on the Wood's Holl pier and breakwater, the completion of the quarters and water tower buildings, and the commencing of the hatching house; the construction of oyster ponds at Wood's Holl and St. Jerome stations, and the investigation of the oyster beds of Chesapeake Bay; the trip of the Albatross to the Caribbean Sea for the purpose of prosecuting hydrographic and fisheries work; the investigation of the Florida shad fisheries by the steamer Fish Hawk; the examination of the oyster beds of Long Island Sound by the steamer Lookout, under the direction of Mr. E. G. Blackford; the investigation of the fish epidemic in Lake Mendota and other lakes of Winconsin; the collection of specimens of cetaceans, through the co-operation of the Life-Saving Service; the construction of a third car for transporting and hatching fish and eggs; the introduction of the cod gill net upon the Pacific coast; the occupation of Fort Washington on the Potomac River, for shad hatching, by permission of the Secretary of War; the occupation of a station at Weldon, N. C., for propagating striped bass or rockfish; the efforts to hatch the codfish at Wood's Holl station; the planting of lobsters in Chesapeake Bay; the importation of blue carp from Germany, and of the European trout (*Salmo fario*) from Germany and England, and the appointment by the Senate of a standing committee on fish and fisheries, to consist of seven Senators.

The principal stations of the Commission in 1884 were as follows: For investigation and research there are three, Gloucester, Mass., Wood's Holl, Mass., and Saint Jerome, Md. At the former it was possible to secure a great amount of help from the fishermen in the way of contributions of information and specimens brought in from the Banks. The office was at first in charge of Capt. S. J. Martin, but in February, 1885, it was reorganized with Mr. W. A. Wilcox in charge, and Capt. Martin as assistant. The information gathered at this station is expected to be of great value, as the treaty of Washington with Great Britain expired on June 30, 1885. At Wood's Holl, which was in charge of Capt. H. C. Chester, since deceased, there were prosecuted special researches and the practical propagation of cod, mackerel, lobsters and other sea fish. At Saint Jerome, which is in charge of W. de C. Ravenel, practical experiments in oyster culture are made.

For the propagation of Salmonidæ there are eight stations. Grand Lake Stream, under the direction of Mr. Charles G. Atkins, is devoted to the propagation of landlocked or Schoodic salmon. Bucksport, Maine, also in charge of Mr. Atkins, is primarily connected with the multiplication of Penobscot salmon. Northville, Mich., in charge of Mr. F. N. Clark, is devoted to whitefish and trout. Alpena, Mich., is an auxiliary station for the whitefish service, and is also under the direction of Mr. Clark. Baird, Shasta county, Cal., on the McCloud River, has been devoted exclusively to the cultivation of the California salmon, for which it is eminently adapted, but the work was suspended during the year. Trout ponds near Baird are situated five miles from the salmon station mentioned above, and the station is devoted to keeping up a large stock of California trout to supply eggs for Eastern waters. Wytheville, Va., this station is rented from the Virginia Fish Commission, in order to obviate the expenses otherwise attendant upon the transporting of the young Salmonidæ, such as California trout, brook trout, landlocked salmon, etc., from other stations to different points, especially to the southern Alleghanies. Cold Spring Harbor, N. Y.: Here are hatched the eggs of the salmon from Maine and the whitefish from Michigan for introduction into the rivers and lakes of northern Pennsylvania and New York. It is in charge of Mr. Fred Mather, who carries on, simultaneously, work for the State of New York and for the United States; the place being in convenient proximity to New York, enjoys excellent facilities for transportation and distribution.

For the propagation of shad there are three stations, Battery station at Havre de Grace, Md., Fort Washington, Md., and the Central station, Washington, D. C., the latter, which is established in the old Armory Building, is now an important point for hatching shad, herring, salmon, whitefish, etc., and receives its supply of eggs from the other stations.

For the propagation of carp there are two stations, the Monument Reservation, Washington, D. C., is the principal one, where are cultivated the leather and mirror carp, gold fish, golden ides and tench are all raised in considerable numbers. At the Arsenal Grounds in Washington the scale carp only are cultivated.

A great deal of useful information is contained in the appendix, which may be divided into five heads, and which consist of 42 separate papers treating upon matters relating to the work of the Fish Commission.

Reports of Steamers and Stations.—The first article is by Lieut.-Commander Z. L. Tanner, and gives a report of the work of the steamer Albatross during 1884, illustrated by three plates. In this report are also included subordinate reports by Lieut. Seaton Schroeder, Passed Assistant Engineer G. W. Baird, Surgeon James M. Flint, Naturalist Jas. E. Benedict, and various tables of temperatures, specific gravities, stations occupied, records of dredging and trawling, and lists of fishes, invertebrates, etc., taken. Next is given a report by Lieut. W. M. Wood, on the work of the Fish Hawk, during 1883 and 1884; and a report follows by Mate James A. Smith on the work of the Lookout during 1884. The twelve papers which follow relate mostly to the propagating operations of the Fish Commission, and consist of the reports from persons charged with the work of propagation, distribution or investigation. They consist of three reports on fish hatching, shipping eggs to foreign countries, and receiving them from foreign countries at the Cold Spring Harbor station, by Mr. Mather; the operations at the

Northville and Alpena stations; the salmon breeding and trout breeding work on the McCloud River, by Mr. Stone; the work in Maine in propagating Penobscot salmon and Schoodic salmon, by Mr. Atkins; the shad hatching operations at Fort Washington station, by Lieut. Babcock; the shad work at the Havre de Grace station, by Mr. Hamlen; the work with oysters at the Saint Jerome station, by Mr. Ravenel, and a report on the water supply of the station at Wood's Holl, by Dr. Kidder.

The Fisheries.—The fifteen papers in this section are of a somewhat general, or statistical nature, giving a view of the fisheries of this country and of northern Europe. The first article is a report by Col. McDonald on the protection which should be afforded by law to the fisheries of the Atlantic coast. A paper follows on the New England fishery for swordfish during 1884, by Mr. A. Howard Clark. Next comes an article giving the statistics of the United States' imports and exports of fish and fishing products, the tonnage of fishing vessels, etc., for the fiscal year ending June 30, 1884, compiled by Mr. Smiley from information furnished by the Bureau of Statistics. Captain Collins has an article on the use of gill-nets in the cod fisheries, with a description of the Norwegian cod-nets and a history of their use in the United States, illustrated by twelve plates; and another paper giving an account of the trips of three Gloucester schooners to the Iceland halibut fishing grounds. The fisheries of Iceland are treated of in four papers, each being a translation from the Danish. The statistics of the Norwegian fisheries in 1880 are given by Boye Strom, after which a translation from the Danish on the need of a central management for the Norwegian fisheries. A valuable paper is given by Dr. Rudolph Lundberg on the fisheries of Sweden, illustrated by a plate showing some of the kinds of apparatus used. This is followed by an article from the Swedish by Prof. A. V. Ljungman on the future of the herring fisheries on the coast of Bohus; and another from the Danish by Lieut. Carl Trolle on salting fish in Jutland. The last paper of the section is a translation from the Danish on the salting of herring, giving valuable information and suggestions in regard to this work.

Fishculture.—The first of the five papers in this section is a review of the failures and successes of artificial fishculture, by Von der Wenyen. This is followed by a long article, by Carl Nicklas, on pond culture, being specially applied to the methods of carp culture in Germany, illustrated by forty-four figures and provided with a table of contents and special index. Next is an article by Charles W. Smiley on some results of carp culture in the United States, which consists mostly of statements of persons thus engaged. An article by Dr. Horst, translated from the Danish, on the development of the European oyster, is illustrated by two plates; and is followed by a statement, translated from the Danish, on oyster culture as seen at the London Fisheries Exhibition, by S. A. Buch.

Scientific Investigation.—Of the five papers in this section the first is a report by J. Walter Fewkes, on the Medusæ collected by the Albatross in the Gulf region in 1883-4, illustrated by ten plates. The next is an article on the origin of heterocercy and the evolution of the fins and fin rays of fishes, illustrated by eleven plates and eight figures, by John A. Ryder. Messrs. Chittenden and Cummins furnish a paper on the relative digestibility of fish flesh in gastric juice, with tables of their experiments. Two translations from the German follow; the first on the migrations of eels, by Dr. Hermes, and the second being a contribution to the natural history of parasites as affecting certain kinds of fish, by Dr. Kerbert.

Miscellaneous.—In this section is a statement of the status of the U. S. Fish Commission in 1884, by G. Brown Goode; while the appendix is concluded by a paper from the German on the results of the London Fisheries Exhibition in their practical value for Germany, by Dr. Benecke, being a general review of the subject and of the articles exhibited.

This series of forty-two papers contains many of high value, and is illustrated by nearly one hundred plates and figures. Nine of the longest articles are provided with special indexes, as it is often desirable to issue these papers in separate pamphlet form for distribution to specialists not interested in the contents of the entire volume.

FROG CULTURE.

EVER since fishculture became an established industry in America the culture of frogs for the table has been talked of. Each year finds us no nearer to it than the last, but the newspapers keep printing glowing accounts of mythical frog farms in different parts of the country, always at some distance from where the paper is published. We have carefully looked up these reports and in every instance found them to be without foundation. Last summer a Western paper located a great "froggery" on Long Island, within a few miles of the State fish hatchery, but no man on the island ever heard of it. Some years ago a fishculturist advocated frog culture and wrote much on the subject, and tried to induce others to go into the business of raising frogs, but took care not to invest his own money in the scheme.

This subject is brought up at this time by the receipt of a letter from a man in Detroit, well known to us as an enterprising fisherman, who says: "Some time since I saw in a paper that a party had formed a company for the purpose of raising frogs for market. I have a fine marsh for this purpose, and should the company wish to go in with me I will put up a freezer to hold them for the winter market. I have written to Seth Green last year, but could get no information about frogs."

In our opinion frogs cannot be reared artificially and leave a margin for profit. They can be hatched by the million, and the tadpoles can be cheaply fed and perhaps protected from their numerous enemies. In the tadpole state they do not require much room, and can therefore be crowded in small pools, but the trouble will begin when this stage is passed and the young frog comes out in the air to catch insects for a living. Then each frog requires space to forage in, for it will be impossible to furnish insects for them, and no other food has been discovered which the young will eat. Sour milk has been proposed, and we have been waiting to learn of its successful use, and have declined to believe it until some one demonstrates it. Another trouble is the cannibal habits of the frog. They will eat a little one or try to swallow a larger one and kill it in the attempt.

In a state of nature the frog is a solitary and unsocial animal except at the breeding season. He sits alone and passes his time in either contemplation, catching insects, worms, etc., or in chanting his own prowess. They never go in herds, as do the fishes, but distrust their own kind, hence the difficulty of rearing them by hand. We believe that all attempts at frog culture will result in the gaining of experience alone, and we do not believe that there is a frog farm in America where they are reared artificially and fed to marketable size. If we are wrong in this matter we ask to be set right, and any successful frog raiser is invited to enlighten us on this subject.

THE WOOD'S HOLL STATION.—The marine hatchery at Wood's Holl, Mass., of the U. S. Fish Commission, is now, since the death of Capt. Chester, and the resignation of Prof. Ryder, in charge of Mr. Chas. G. Atkins, of Maine. Mr. Atkins still has charge of the Maine stations at Orland and Grand Lake Stream, where the salmon and the land-locked salmon are hatched, and is assisted at the latter places by Mr. W. C. Buck. At Wood's Holl the experiments with cod, mackerel, lobsters, etc., will be continued and have met with success. The English soles there are kept in tanks and are growing finely, and their increase is confidently looked for in time.

The Kennel.

FIXTURES.

DOG SHOWS.

March 8 to 11.—Second Annual Dog Show at Buffalo, N. Y. Geo. H. Chadeayne, Secretary, No. 6 Brown's Building, Buffalo, N. Y.

March 22 to 25, 1887.—Spring Show of the New Jersey Kennel Club, Newark, N. J. A. C. Wilmerding, Secretary, 17 Murray street, New York.

March 29 to April 1, 1887.—Inaugural Dog Show of Rhode Island Kennel Club, Providence, R. I. N. Seabury, Secretary, Box 1833, Providence.

April 5 to 8, 1887.—Third Annual Dog Show of New England Kennel Club, Boston. F. L. Weston, Secretary, Hotel Boylston, Boston, Mass.

April 12 to 15, 1887.—Thirteenth Annual Dog Show of the Western Pennsylvania Poultry Society, at Pittsburgh, Pa. C. B. Elben, Secretary.

April 19 to 22.—Annual Dog Show of the Philadelphia Kennel Kennel Club. E. Comfort, President.

April 26 to 29.—Second Annual Dog Show of the Hartford Kennel Club. A. C. Collins, Secretary, Hartford, Conn.

May 3 to 6, 1887.—Eleventh Annual Dog Show of the Westminster Kennel Club, Madison Square Garden, New York. James Mortimer, Superintendent.

FIELD TRIALS.

Nov. 21.—Ninth Annual Field Trials of the Eastern Field Trials Club, at High Point, N. C. W. A. Coster, Secretary, Flatbush, Kings County, N. Y.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **4697.**

ENGLISH SPANIEL CLUB STANDARDS.

THE following points and descriptions of the different varieties of spaniels have just been issued by the English Spaniel Club:

THE ENGLISH WATER SPANIEL.

POSITIVE POINTS.—Head and jaw, and eyes, 20; ears, 5; neck, 5; body, 10; forelegs, 10; hindlegs, 10; feet, 5; stern, 10; coat, 15; general appearance, 10—total positive points, 100.

NEGATIVE POINTS.—Feather on stern, 10; topknot, 10—total negative points, 20.

DESCRIPTIVE PARTICULARS.

Head.—Long, somewhat straight and rather narrow; muzzle rather long, and, if anything, rather pointed.

Eyes.—Small for the size of the dog.

Ears.—Set in forward, and thickly clothed with hair inside and out.

Neck.—Straight.

Body (including size and symmetry).—Ribs round, the back ones not very deep.

Nose.—Large.

Shoulders and Chest.—Shoulders low and chest rather narrow, but deep.

Back and Loin.—Strong, but not clumsy.

Hindquarters.—Long and straight; rather rising toward the stern than drooping, which, combined with the low shoulder, gives him the appearance of standing higher behind than in front.

Stern.—Docked from 7in. to 10in. according to the size of the dog, carried a little above the level of the back, but by no means high.

Feet and Legs.—Feet well spread, large and strong; well clothed with hair, especially between the pads. Legs long and strong; the stifles well bent.

Coat.—Covered either with crisp curls or with ringlets; no topknot, but the close curl should cease on the top of the head, leaving the face perfectly smooth and lean looking.

Color.—Black and white, liver and white, or self-colored black or liver. The pied for choice.

General Appearance.—Sober looking, with rather a slouching gait and a general independence of manner, which is thrown aside at the sight of a gun.

THE IRISH WATER SPANIEL.

POSITIVE POINTS.—Head and jaw, eyes and topknot, 20; ears, 5; neck, 5; body, 10; forelegs, 10; hindlegs, 10; feet, 5; stern, 10; coat, 15; general appearance, 10—total positive points, 100.

NEGATIVE POINTS.—Feather on stern, 10; white on chest, 3—total negative points, 13.

DESCRIPTIVE PARTICULARS.

Head.—Skull medium length, rather broad, with very little "stop," muzzle long and broad to the end.

Eyes.—Dark brown and very intelligent looking.

Ears.—Long and covered with curls.

Neck.—Long, slightly arched and muscular.

Body (including size and symmetry).—Fair-sized, barrel well rounded and well ribbed up.

Nose.—Liver-colored, large and well developed.

Shoulders and Chest.—Shoulders long and oblique, chest deep but not very wide.

Back and Loin.—Back strong and flat; loin strong, fair length, and a trifle arched.

Hindquarters.—Long, hocks well let down, and the stifles straighter than in other varieties of spaniels, neither turned inward nor outward.

Stern.—Strong at the root, and tapering to a fine point; the hair on it must be quite short, straight and close-lying.

Feet and Legs.—Legs well boned and quite straight, somewhat long; feet rather large.

Coat.—All over little curls, hard but not woolly. The topknot of long hair should fall over the eyes in a peak, and the legs should have as little feather on them as possible.

Color.—A rich dark liver—white on toes or breast a defect, but not a disqualification.

General Appearance.—That of a strong, somewhat leggy dog.

THE CLUMBER SPANIEL.

POSITIVE POINTS.—Head and jaw, 25; eyes, 5; ears, 5; neck, 5; body, 20; forelegs, 5; hindlegs, 5; feet, 5; stern, 5; coat and feather 10; general appearance, 10—total positive points, 100.

NEGATIVE POINTS.—Light nose, 10; curled ears, 10; curled coat, 20—total negative points, 40.

DESCRIPTIVE PARTICULARS.

Head.—Large, square and massive, flat on top, ending in a peak at occiput, round above eyes, with a deep stop; muzzle heavy and freckled, lips of upper jaw slightly overhung; skin under eyes dropping and showing hair.

Eyes.—Dark brown, slightly sunk and showing haw.

Ears.—Large and well covered with straight hair and hanging slightly forward, the feather not to extend below the leather.

Neck.—Very thick and powerful, and well feathered underneath.

Body (including size and symmetry).—Very long and heavy, and near the ground. Weight of dogs, 55lbs. to 65lbs.; bitches, 45lbs. to 55lbs.

Nose.—Square and flesh-colored.

Shoulders and Chest.—Wide and deep—shoulders strong and muscular.

Back and Loin.—Back straight, broad and long; loin powerful and well let down.

Hindquarters.—Very powerful, with thighs placed well at back of body.

Stern.—Set very low (while retaining the more important point of a straight back), well feathered and carried about level with the backbone.

Feet and Legs.—Feet large and round, well covered with hair; legs short, thick and strong; hocks low.

Coat.—Long, plentiful, soft and straight.

Color.—Plain white with lemon markings; orange permissible, but not so desirable; slight head markings, with white body preferred.

General Appearance.—Should be that of a very long, low, heavy, massive dog, with a thoughtful expression.

THE SUSSEX SPANIEL.

POSITIVE POINTS.—Head and jaw, 15; eyes, 5; ears, 5; neck, 5; body, 15; forelegs, 10; hindlegs, 10; feet, 5; stern, 5; coat and feather, 10; general appearance, 15—total positive points, 100.

NEGATIVE POINTS.—Light eyes 5; narrow head, 10; weak muzzle, 10; curled ears or high set on, 5; curled coat, 15; carriage of stern, 5; topknot, 10; white on chest, 10; color (too light or too dark, 10; legginess or light of bone, 5; shortness of body or flat-sided, 5; general appearance, sour or crouching, 10—total negative points, 100.

DESCRIPTIVE PARTICULARS.

Head.—Should be moderately long and massive, with depth in proportion, to obviate a flat appearance; skull broad and forehead prominent.

Eyes.—Hazel color, fairly large and languishing, not showing the haw overmuch.

Ears.—Thick, fairly large and lobe-shaped; set moderately low, but relatively not so low as in black or other varieties of spaniels; carried close to the head, and furnished with wavy hair.

Neck.—Muscular and slightly arched.

Body (including size and symmetry).—Long, with well-sprung ribs, and a fair depth behind the shoulders.

Nose.—Liver color; muzzle large and square, with lips somewhat pendulous and nostrils well developed.

Shoulders and Chest.—The shoulders should be oblique, and the chest deep and wide.

Back and Loin.—Back level and long, and loin broad.

Hindquarters.—Strong, thighs muscular and hocks low down.

Stern.—Docked from 5in. to 8in., set low, and not carried above the level of the back.

Feet and Legs.—Legs short and strong, with immense bone and a slight bend in the forearm. Feet large and round, and moderately well feathered, with short hair between the toes.

Coat.—Bodycoat abundant, flat or slightly waved, with no tendency to curl, moderately well feathered on legs and stern, but clean below the hocks.

Color.—Dark golden liver, not a light ginger or snuff color, but rather of a rich bronze tinge, not puce; the color will vary and go darker when the dog is kept out of Sussex, especially in those parts where the climate and soil differ materially from that of Sussex.

General Appearance.—Rather massive and muscular, but with free movements and nice tail action, denoting a tractable and cheerful disposition—weight from 35lbs. to 45lbs.

BEAGLES.

Editor Forest and Stream:

As I know a great many of your readers are deeply interested in your kennel department, and among them all the members of the American-English Beagle Club, I take liberty of sending you a few words about the beagle. The breeding of these gamy little hounds is steadily increasing throughout New England, for the sportsmen here find them of great value in rabbit shooting, and that is the favorite winter sport here. They follow just slow enough to allow the hunters to keep near them on foot, while briers and thickets have no terrors for them and their cry is melodious in the extreme. There are probably a dozen sportsmen in Rhode Island who have good hunting beagles, and among these are several that are pretty sure to get a marking at the spring bench shows. The largest owner and breeder here is Mr. A. H. Wakefield, who was so successful at the shows of 1886, and his kennel is now in better condition than ever. He recently bought out the interest of his partner, Mr. Andrew Winsor, and now controls the kennel. During the winter his pack of beagles have been hunted in different parts of the State, and have invariably done grand good work.

Last week Mr. Wakefield made a trip to Mr. Dorsey's kennel at New Market, Md., and purchased two beagles there, My Boy (Lee—Diana) and May Belle II. (Lee—May Belle), which are good show dogs and have hunted well. Mr. Wakefield's trip was a most enjoyable one and his accounts of it have made several hours pass most pleasantly at the rooms of the R. I. K. C. The Southerner and his Northern brother met on the broad platform of true sportsmen and should Mr. Dorsey ever visit Providence his stay will be made pleasant. His plantation is a large one and his sixty or more beagles have the full run of it and are hunted a good portion of the season; he breeds for the field, but produces show dogs as well, which is the acme of beagle breeding. Of his kennel, Lee, his head stud dog, now eight or nine years old, is as good a beagle as stands in America to-day, and his progeny includes many good ones. Mr. Dorsey's pet pack can out-style and out-hunt any pack of small hounds that stand to-day, and if they could be shown at a field trial would astonish the champions of big hounds as well as delight lovers of the beagle. Most of them stand from 14 to 15in. high, are white, black and tan, deep in chest, with true hound head, and the pleading beagle eye so desirable. Mr. Wakefield also visited Dr. Downey, who is so well known as a beagle expert, and at Baltimore was entertained by Mr. W. Stewart Diffenderffer, of the Woodbrook Kennels, who has shown some very good hounds on the bench.

There is a great deal of work being done here in preparing for the first annual show of the Rhode Island Kennel Club, which is set down for March 29 to April 1, and though new in the business the club hopes to have a good show. The premium lists have been out a week now and provide for 118 classes, the champions all to get medals, while for the open classes thre are prizes of $10 and $5, and $8 and $4. The champion medals will be of solid silver and will be very handsome and valuable. The judges so far arranged for are Dr. H. Clay Glover, Mr. Chas. H. Mason and Dr. Wm. Jarvis.

REYD.

PROVIDENCE, R. I., Feb. 8.

We made preparation for a rabbit hunt with the beagles on Jan. 31, and as luck would have it it was, as Mr. Parry said, "a likely looking day to run rabbits," and so it proved. We started off about 7 A. M. with five beagles, two old ones and three puppies, one of them 8 months and the other two 12 months old. We reached the rabbit grounds about 8:30 A. M. and did not have to wait long for a start for the old boys struck scent immediately on entering the swamp, and the rabbit gave the whole pack a good run of five minutes, and then went to burrow and we did not get a shot at him. It was not long before they had another one going, and it was better luck this time for he went right by within 15yds. of us, and Mr. Parry downed him at once. It was about twenty minutes before they got up another one and he did not run over a minute before he took to a burrow and when we came up to the dogs they all were at the

burrow and we had hard work to call them off, but after a while they came away and it was only a few minutes before they had another start, and such driving I never saw. We had worked up a hill and we got on top of a high rock and watched the fun, and such music as we had for twelve or fifteen minutes was worth walking a dozen miles to hear. It was a good open place and the rabbit must have been an old settler for he went round that hill six or seven times and two of the dogs kept gaining on him so that the last time he went round he made for a swamp about an eighth of a mile distant, but the two dogs were a little too much for him for he had not covered more than half the distance before they were on him, and by the time we got to them the rabbit was hardly in condition to put in a game pocket. It was now about noontime and as we wanted to get back by 5 o'clock, we started toward home and on our way we started four more, two of them going to burrows and the other two we shot. We arrived home at 3:45 pretty well tired out, but with the satisfaction that we had had a glorious good hunt. The way our dogs worked fully satisfied us that the beagle is the dog for rabbits. You have got to have a good one about here to get any rabbits for they are scarce as hen's teeth. We have been out before now all day and not got more than two, and once or twice it has been one, but we have never been skunked. The beagles take hold and hunt well when they are six months old and there is no breaking needed; all that is necessary is to buy a good one from good hunting stock, and the chances are he will go in good shape when he is nine or ten months old, at least that has been my experience, and I have had three puppies the last eighteen months and they all would hunt well at six months of age.

W. S. CLARK.

LINDEN, Mass.

THE TENNESSEE FIELD TRIALS.

FOLLOWING is a list of entries for the Field Trials of the Tennessee Sportsman's Association to be given at Athens, Ala., this week.

ENGLISH SETTERS.

FRED W. (B. F. Wilson), black, white and tan dog (Count Noble—Spark).

KATY D. (B. F. Wilson), black, white and tan bitch (Count Noble—Dashing Novice).

KING NOBLE (J. I. Case, Jr.) blue belton dog (Count Noble—Rosalind).

NORTIER (J. W. Bessover), black, white and tan dog (Paul Gladstone—Bo Peep).

FANNIE WHITFIELD (Dr. R. Douglass), blue belton bitch (Dash Bryson—Daisy Whitfield).

DASH BRYSON (A. M. Young), black and white dog (Dave Bryson—Jackson's Rose).

POINTERS.

RICHMOND (J. E. Gill), lemon and white dog (Don—Beulah).

DON'S DOT (J. E. Gill), lemon and white bitch (Don—Cremorne).

DERBY.

ENGLISH SETTERS.

FRED. W. (B. F. Wilson), black, white and tan dog (Count Noble—Spark).

DIXIE BELTON (J. I. Case), black and white bitch (Dick B.—Belle Benton).

KING'S DAN (J. I. Case), blue belton dog (King Noble—Elsie Belton).

FLORA (P. Kinnard), lemon and white bitch (Charm—Hilda).

RODIRAKA (Dr. J. N. Maclin), black, white and tan bitch (Roderigo—Gem).

POINTERS.

DON'S DOT (J. E. Gill) lemon and white bitch (Don—Cremorne).

THE ATLANTA DOG SHOW.

Editor Forest and Stream:

The first dog show of the National Poultry and Bench Show Association was held here last week. The attendance was very good, the show being patronized by our best society; nearly one hundred dogs were shown, and the officers of the society feel encouraged to put forth efforts for a show next year that will surpass anything of the kind ever seen in the South. Major J. M. Taylor, of Cleveland, Ohio, judged the setters and pointers, and the superintendent, Mr. T. F. Rackham, of Grovestend, N. S., the remaining classes. I send a list of the

AWARDS.

MASTIFFS.—*Dogs:* 1st, R. W. Smith's Turk II. *Bitches:* 1st, D. Morrison's Flora. *Puppies:* 1st, R. W. Smith's Turk, Jr; 2d, B. Torbett's Vic.

ST. BERNARDS.—*Dogs:* No entries. *Bitches:* No entries. *Puppies:* 1st and 2d, A. A. McDuffie's two unnamed.

NEWFOUNDLANDS.—1st, withheld; 2d and com., D. Morrison's Kate and unnamed.

GREYHOUNDS.—*Dogs:* 1st, and high com., W. R. Joyner's Fly and Tom; 2d, R. D. Williams's Snowflight; very high com., T. W. Francis's Dan. *Bitches:* 1st, T. W. Francis's Kate.

ENGLISH SETTERS.—*Dogs:* 1st and very high com., Major J. W. Renfroe's Paul Jones and Jim Bludsoe; 2d and very high com., J. S. Clarke's Blackstone and Clipper. High com., W. E. Venable's Baden Baden. *Bitches:* 1st, E. H. Hyde's Daisy Dot; 2d, F. C. Hand's Flida. Com., C. L. Lloyd's Flora. PUPPIES.—10 TO 18 MONTHS—*Dogs:* No entries. *Bitches:* 1st and 2d, D. Morrison's Tasso Royal and Daisy Royal.—UNDER 10 MONTHS—*Dogs:* 1st, J. W. Renfroe's Prince; 2d and high com., D. Morrison's Glad and Gleam, Jr. *Bitches:* 1st, withheld; 2d, D. Morrison's Gladys.

IRISH SETTERS.—*Dogs:* 1st, E. B. Thomas's Gordon. *Bitches:* No entries.

GORDON SETTERS.—*Dogs:* No entries. *Bitches:* 1st, J. F. Rode's Jean; 2d, D. Morrison's Queen Dido. *Puppies:* 1st, F. P. O'Brien's Bob.

POINTERS.—SMALL—*Dogs:* 1st, withheld; 2d, F. C. Hand's Neptune. *Bitches:* 1st, withheld; 2d, D. Morrison's Princess Nettle. PUPPIES—10 TO 18 MONTHS—*Dogs:* 1st, Foshell & Eliott's Rock of Marco; 2d, G. Enbank's Alabama Boy. *Bitches:* 1st, W. E. Venable's Dago. High com., D. Morrison's Lady B.—UNDER 10 MONTHS—*Dogs:* 1st and high com., J. W. Renfroe's Flash and Flake; 2d, E. H. Hyde's Pendennis. *Bitches:* 1st, F. J. Pollard's Kate F; 2d, D. Morrison's Dell.

SPANIELS.—BLACK—1st, Dr. A Green's Flo II. Other than black, prizes withheld. Very high com., D. Morrison's Ruby.

FOX TERRIERS.—1st, W. T. McAlee's General Grant. *Bitches:* 1st, withheld; 2d, J. N. Shepherd's Lady Winnis.

COLLIES.—*Dogs:* 1st, O. P. H. Scott's Burno; 2d, withheld. High com., D. Morrison's Jock.

BULL-TERRIERS.—1st and 2d withheld. Com., J. B. McDonald's Cline and W. C. Spark's Foxey.

SKYE TERRIERS.—1st, C. A. Shinn's Lady Kate.

YORKSHIRE TERRIERS.—1st, withheld; 2d, L. Evans's Dandy.

TOY TERRIERS.—1st and very high com., J. J. Harrison's Don and Dandy.

PUGS.—1st and very high com., Miss M. Bannistor's Jumbo Jr. and Jim; 2d, D. Morrison's Gipsy Queen.

SPECIAL PRIZES.

Best pointer, Rock of Marco; best dog bred in Georgia, Paul Jones; cocker spaniel, Flo II.; spaniel, Ruby; largest collection, D. Morrison.

HARTFORD DOG SHOW.—Hartford, Conn., Feb. 7, 1887. —*Editor Forest and Stream:* We claim April 26, 27, 28 and 29 for our bench show. We wish to hear from exhibitors regarding puppy classes.—HARTFORD KENNEL CLUB (A. C. COLLINS, Secretary).

SPANIEL SWEEPSTAKES.

Editor Forest and Stream:

The American Spaniel Club has decided upon offering the following sweepstakes, to be decided at the show of the New Jersey Kennel Club, to be held at Newark, N. J., next month. Sweepstakes for field spaniels whelped in 1886, open to members only; entry, $3, with $10 added by the club to go to winner. Forty per cent. to winner, 30 per cent. to breeder of winner, 20 per cent. to second and 10 per cent. to third. Entries close with the secretary March 10. Entries must also be made in their regular classes at the Newark show.

A. C. WILMERDING, Sec'y.

17 MURRAY STREET, New York.

AMERICAN KENNEL REGISTER.

FOLLOWING are the numbers of the 91 dogs entered in the February issue of the *American Kennel Register:*

BEAGLES.

4607. Dan, W. E. and H. L. Ellis.
4608. Dot IV., J. Satterthwaite.
4609. Gip, J. Satterthwaite.
4610. Jick, J. Satterthwaite.
4611. June, N. R. Tatum.
4612. Leo. II., Frank Dow.
4613. Look, J. Satterthwaite.
4614. Sport II., J. Satterthwaite.
4615. Tick II., J. Satterthwaite.

BULLDOGS.

4616. Doctor Bush, W. M. Pond.
4617. Juno, John E. Thayer.

COLLIES.

4618. Bessie Wildfire, R. I. Curry.
4619. Bruce VII., Miss Eleanor W. McGhee.
4620. Collie II., A. M. Webb.
4621. Daily, Isaac Oldham.
4622. Davy Crockett, J. F. Dougherty.
4623. Gypsy D., J. R. Draper.
4624. Kit, R. Rathvon.
4625. Le Madge, Robt. I Curry.
4626. Lord Duff, Miss Lillian Rushmore.
4627. Lucy D., H. C. Cuming.
4628. Mac II., Henry Fink.
4629. Nora II., W. R. Rathvon.
4630. Ramsden's Bruce, Miss Mary Ramsden.
4631. Ramsden's Trusty, Miss Mary Ramsden.
4632. Shanter, Clamp Jackson
4633. Tam o' the Clyde, Herbert S. Barnes.
4634. Zoe. Miss Jennie R. Kroch.

DEERHOUNDS.

4635. Glengarry, J. M. Ide.
4636. Lance, J. E. Thayer.
4637. Lyndhurst, E. M. Whittemore.
4638. Sheila, J. M. Ide.

MASTIFFS.

4639. Ah Sin, H. L. Haldeman.
4640. Ashmont Duke II., F. P. Campbell.
4641. Beech Grove Grover C., P. K. Jones.
4642. Brother, T. S. Armstrong.
4643. Bruce II., F. S. Baston.
4644. Neva, L. T. Hazen.
4645. Susie Queen, S. M. Bines.

POINTERS.

4646. Blanche Sensation, F. Pitzer
4647. Bowdoin, F. F. Harris.
4648. Button Heard, J. P. Cartwright.
4649. Clip, G. F. Bell.
4650. Dan II., Grasmere Kennels.
4651. Doctor, W. Crawford.
4652. Duke Royal II., F. E. Clark.
4653. Lanetta II., S. A. Bennett.
4654. Leah, J. C. F. Moran.
4655. Lillie Langtry, H. C. Miner.
4656. M'liss, H. E. Jones.
4657. Puritan, A. Liddle.
4658. Rob Roy II., S. F. Colt.
4659. Royal Prince, S. A. Bennett
4660. Telie Doe, D. W. Oyster.

PUGS.

4661. Douglas II., A. E. Pitts.
4662. Goldine, E. G. Riedinger.

ST. BERNARDS.—ROUGH-COATED.

4663. Hector II., W. R. Watts.
4664. Queen Dido, Grasmere Kennels.

SETTERS—ENGLISH SETTERS.

4665. Bob White, Jas. R. Milner.
4666. Boss, Louie S. Miller.
4667. Brookwood, W. B. Brown.
4668. Doctor, Geo. Graig.
4669. Idylwoof, A. S. Hoffman.
4670. Lady Saddler, W. E. Scott.
4671. Lord Saddler, W. E. Scott.
4672. Peero, A. H. Harwood.
4673. Pep Bondhu, T. C. Robertson.
4674. Phidippides, E. M. Shepard.
4675. Sagamore Morah, Sagamore Kennels.
4676. Scott Saddler, F. Clements.
4677. Victoria Laverack, Chas. York.

GORDON SETTERS.

4678. Royal Duke, E. Maher.

IRISH SETTERS.

4679. Brandy, Wm. E. Ramsay.
4680. Chip II., S. C. Steuben.
4681. Flash, W. E. Ramsay.
4682. Glenna, H. A. Bridge.
4683. Lady May, R. Bradley.
4684. Mack II., Geo. L. Myer.
4685. Mike II., C. W. Badeau.
4686. Nora V., C. W. Roedenburg.
4687. Red Flash, H. B. Spencer.

SHEEPDOGS—BOB-TAILED.

4688. Dame Bruin, W. Wade.

SPANIELS—FIELD AND COCKER SPANIELS.

4689. Black Jock, E. D. Hicks.
4690. Hornell Spot, Hornell Spaniel Club.

TERRIERS—BULL-TERRIERS.

4691. Blanche, Jas. E. Maddrath.
4692. Daisy, J. E. Coleman and G. A. Barrett.

FOX-TERRIERS.

4693. Mt. Toby Mixture, C. I. Bailey.
4694. Viper, Maitland & Bunker.
4695. Vixen, Maitland & Bunker.

SKYE TERRIERS.

4696. Snip, Geo. A. Barrett.
4697. Topsey, R. T. Palmer.

INTELLIGENT DOGS.

MR. BARNES, of this city, owns a lemon and white setter named Don, who cut his foot on some glass. One day he tied some cloth on his dog's foot and let him out, telling him that if he lost the rag he would have to come in. In a little while he lost the rag, and therefore was obliged to come in the house. Don seemed very uneasy and ran from one room to another; finally he came running to his master, holding a piece of cloth in his mouth. He then placed his sore foot on his master's knee. His master could not refuse; he bandaged Don's foot up once more and let him out.

The next time he came into the house, the rag was all right. He never lost another rag off his foot. If that was not reasoning what was it?

LITTLE RHODY.

PAWTUCKET, Rhode Island.

Mrs. B. T. Rogers, of Kenosha, is the possessor of a wonderfully intelligent collie dog. Two weeks ago Miss Rogers lost a valuable gold watch, and although large rewards were offered for its recovery, and many Kenosha people joined in the search, no trace of it could be found. The watch was finally given up for lost, when on Sunday morning the dog walked in the house with the missing article in his mouth. The Rogers family firmly believe he heard them talking about it, and that he instituted a search on his own account.—*Milwaukee Wisconsin.*

Connecticut has just lost, in the death of Carlo, a dog of Farmer Tucker of Oxford, one of her most intelligent residents. It is said that it was common for Mrs. Tucker to send dinner by Carlo to men at work about a mile from the house. The workmen would send him home for a pail of water and he would return with it. Two of the men after cutting wood on one side of the mountain went over on the other side. Carlo finding an axe, and thinking it was left there by mistake, brought it home, a half mile or more. He would lead a horse by the halter. He knew different tools by their names. He knew a few families by name. Mr. Tucker one day holding a letter in his hand and saying, "I wish Mrs. Chatfield could see this letter," Carlo unbidden advanced took it in his mouth, and carried it past several houses to the house of the person named, and presented it to her.

A dog owned by Colonel Newton, of Cromwell, goes twice a day to the railroad station for the morning and evening paper. He goes of his own accord, is always on time, and waits about where the baggage car is to stop, in the morning at one place and in the afternoon at another. There he waits until the bundle is thrown off and opened by the station master, when he takes his paper in his mouth and immediately starts for home. If the weather is rainy, he has a piece of oilskin which is kept in a place where he can get it himself, and of his own accord he carries this with him, and the station master wraps it around the paper before giving it to him in order that it may not get wet. On his return home, he puts the oilskin away in its place, against the next rainy day. He knows the papers and insists on having the right one. Once he was fooled. In opening the bundle the station master slipped one that was two days old out of his pocket and handed it to the dog. Demo took it in his mouth and started for home. Arriving there he took it to his master, and was rewarded by a pat on the head and a kind word. Colonel Newton adjusted his spectacles and began to read. Of course he at once discovered the trick, although he thought at the time it was only an error. Calling Demo to him, he told him to take the paper back, and reprimanded him for making the mistake. I don't know what it was he said to him, but the dog seemed to understand it, for he hung his head and really looked ashamed. In a short time he was at the station, with the old paper in his mouth, and going to the agent laid the paper at his feet and, looking in his face, gave a short and very decided bark, as much as to say, "Give me the right paper and do it now." He was offered one that was a day old, but after sniffling at it for a moment refused to take it, and not until he was given a paper of that date would he have anything to do with it. Since then, although an attempt has been made several times to fool him again in the same way, he cannot be deceived, and so, as I said before, it seems as though the dog must be able to read.—*Middlesex County Record.*

OUR DUMB RELATIONS.

IT WAS said of St. Francis of Assissi that he had attained through the fervor of his love, the secret of that deep amity with God and his creation, which, in the language of inspiration, makes man to be in league with the stones of the field, and the beasts of the field to be at peace with him. The world has never been without tender souls, with whom the golden rule has a broader application than its letter might seem to warrant. The ancient Eastern seers recognize the rights of the brute creation, and regarded the unnecessary taking of the life of the humblest and meanest as a sin; and in almost all the old religions of the world there are legends of saints in the depth of whose peace with God and nature all life was sacredly regarded as the priceless gift of heaven, and were thus enabled to dwell safely amid lions and serpents.

It is creditable to human nature and its unperverted instincts that stories and anecdotes of reciprocal kindness and affection between men and animals are always listened to with interest and approval. How pleasant to think of the Arab and his horse, whose friendship has been celebrated in song and romance. Of Vogelweid, the Minnesinger and his bequest to the birds. Of the English Quaker visited wherever he went by flocks of birds, who, with cries of joy, alighted on his broad-brimmed hat and his drab coat sleeves. Of old Samuel Johnson, when half blind and infirm, groping abroad of an evening for oysters for his cat. Of Walter Scott and John Brown, of Edinburgh, and their dogs. Of our own Thoreau, instinctively recognized by bird and beast as a friend. Emerson says of him: "His intimacy with animals suggested what Thomas Fuller records of Butler, the apiologist, that either he had told the bees things or the bees had told him. Snakes coiled round his legs; the fishes swam into his hand; he pulled the woodchuck out of his hole by his tail and took foxes under his protection from the hunters."

In the greatest of the ancient Hindoo poems—the sacred book of the Mahabharata—there is a passage of exceptional beauty and tenderness, which records the reception of King Yudishthira at the gate of Paradise. A pilgrim to the heavenly city, the King had traveled over vast spaces, and one by one the loved ones, the companions of his journey, had all fallen and left him alone, save his faitful dog, which still followed. He was met by Indra and invited to enter the holy city. But the King thinks of his friends who have fallen on the way and declines to go without them. The god tells him they are all within waiting for him. Joyful, he is about to seek them, when he looks upon the poor dog, who, weary and wasted, crouches at his feet, and asks that he too may enter the gate. Indra refuses, and thereupon the King declares that to abandon his faithful dumb friend would be as great a sin as to kill a Brahmin.

"Away with that felicity whose price is to abandon the faithful!
Never, come weal or woe, will I leave my faithful dog.
The poor creature, in fear and distress, has trusted in my power to save him;
Not, therefore, for life itself, will I break my plighted word."

In full sight of heaven he chooses to go to hell with his dog, and straightway descends, as he supposes, thither. But his virtue and faithfulness change his destination to heaven, and he finds himself surrounded by his old friends and in the presence of the gods, who thus honor and reward his humanity and unselfish love.—*John G. Whittier, in Our Dumb Animals.*

THE NEWARK DOG SHOW.—The third dog show of the New Jersey Kennel Club, to be held next month, promises to be the best show in many respects that the club has yet held. The premium list provides for thirty-two champion classes. The prizes in the most important classes will be $20, $10, medal and diploma. Several of the other classes have $15, $10, medal and diploma. Nearly all the other classes have $10, $7, medal and diploma, while a few of the minor classes have $10, medal and diploma. Puppies have three prizes, one of cash, a medal and diploma. There will be a large number of valuable specials offered in addition to the regular prizes. The American Spaniel Club's sweepstakes for spaniels will be decided at this show, as well as the Collie sweepstakes and the Tomboy fox-terrier stake.

BUFFALO DOG SHOW.—Mr. John Davidson, Monroe, Mich., will judge the pointers and setters at the Buffalo dog show, and Messrs. C. H. Mason, New Rochelle, N. Y., and James Watson, Philadelphia, Pa., are announced to judge the remaining classes, but Mr. Watson writes us as follows: Philadelphia, Feb. 14.—*Editor Forest and Stream:* I see that the Buffalo premium list has my name as one of the judges. I wrote some time ago to Mr. Fellows saying that he would oblige me by withdrawing my name. I cannot go to Buffalo show, and must forego the honor imposed upon me. I feel assured that Mr. Mason will be fully able to judge all the classes not taken by Mr. Davidson and give every satisfaction to fair-minded exhibitors.—JAS. WATSON.

HARE DOGS—*Editor Forest and Stream:* I think "Dalg" is exactly correct as to how to breed rabbit hounds. I am the owner of several beagles, and I find that while they positively have better noses and lots of grit, they have too little speed. One advantage a beagle has over a foxhound is he barks less; too much and too often barking is not desirable. On the other hand a foxhound is to be preferred to the beagle for one reason, he has more go in him. Show me rabbit dogs, the get of a first-class beagle bitch, thoroughly broken on rabbits only, and a smart, well-bred foxhound, the latter must be broken to hunt rabbits, and you will find the best rabbit hounds that can possibly be procured. I speak from actual experience.—JERSEY.

MR. H. WYNDHAM CARTER.—When the editor of the *Kennel Review* first entered upon the stage of the British kennel world it was as a devoted lover of St. Bernards. He soon undertook the important role of honorary treasurer to the St. Bernard Club, having for a colleague as secretary the Rev. Arthur Carter, who is well-known as a successful St. Bernard breeder and exhibitor. Being of the same name it was often believed they were brothers, but we understand they were not related. Intimately connected with them at that period were Messrs. Krehl and J. Grant Crawford, both members of the St. Bernard Club Committee. Mr. Carter's long list of difficulties had its commencement in an incident arising out of his club's show. The well-known Swiss breeder, Mr. Schumacher, of Berne, had sent to the English show some dogs which he desired to sell. A reference to our English files at this date shows that Mr. Carter became possessed of these dogs, and various serious charges arising out of the transaction were preferred against him. He was twice brought before the committee of the Kennel Club. On the first occasion he was let off with a caution, which mentioned that he had not been straightforward; but on the second, he was found guilty of discreditable conduct and suspended from exhibiting for six months. The St. Bernard Club followed suit and expelled him. With this the flood of his wrath and bitterness burst the gates and poured down upon his former friends. Mr. Murchison, a well-known name in the history of the St. Bernard breed and a member of the Kennel Club, first felt its effects. No charge was to foul to hurl at Mr. Murchison, and in his blind fury Mr. Carter did not hesitate to accuse his opponent of poisoning his dogs. Mr. H. Stephens, the secretary of the Kennel Club, was the next subject for his vituperation, which only ceased when the victim turned upon his tormentor and administered personal castigation. It is said that Mr. Krehl, who at that time conspicuously figured as Mr. Carter's defender, interposed in this scene and saved Mr. Carter from the full assault that was intended. Mr. Stephens' only offense had consisted in being, as secretary, the mouthpiece of the Kennel Club's verdict, and because the Rev. Cumming Macdona was the chairman, and the Rev. A. Carter the secretary of the club that expelled him, they also now fell under his lash. His malignity to Mr. Macdona extended to circulating broadcast pamphlets containing injurious remarks when that gentleman was seeking a seat in the British Parliament. The Rev. A. Carter he held up to public contempt as a corrupt judge and an unworthy clergyman. Several other gentlemen in the English dog community shared in the abuse that filled the editorial columns of the *Kennel Review*, Messrs. Vero Snow, Gresham, Dalziel, Clement, Sewell, etc. But the greatest surprise came when he turned upon the gentleman who had hitherto befriended him in all his troubles, Mr. Krehl. In this instance Carter finished as he began with the culminating charge of poisoning his dogs. Such frenzied accusations were rendered harmless by their own pitiable ludicrousness. Still, the tone of the *Kennel Review* became even wilder when we read that his solicitor had to suffer the insinuation that he had purloined his client's letters. Even public bodies could not escape the extravagant suspicions of this distracted mind, and the English post office was charged with appropriating his letters, money and stamps. He had succeeded in constituting himself the terror of his surroundings and the dog community. It is related that in the shows he visited of late he carried a swordstick and pistols. His protecting star began to pale, old friends he had alienated and new ones were not to his tastes. The extraordinary immunity he enjoyed from retaliation, legal and physical, must be attributed to indifference. The nervous few who continued to lend him countenance doubtless did so under the fear that their characters might be the next he would fly upon and rend. Monetary difficulties invited the final catastrophe, when, accompanied by a hired gang of men, he forced his way through bailiffs and entered his house. Directly after he appeared at a window, and upon the man who represented his creditor refusing to leave, fired at him with a revolver, another man called him a coward for shooting at the first named and struck at him with a stick, then Carter fired down on him, and a shot entering his eye the sight was destroyed. At the trial evidence was brought forward to prove premeditation and he was found guilty. Then evidence was given of former threats to shoot tax collectors, and the judge remarking it was one of the worst cases he had ever tried, sentenced Carter to five years penal servitude. The news came like a clap of thunder to all who had ever heard of him. So terrible is the sentence that many of his victims, the most deeply wronged, are struck dumb. The most charitable construction we can put upon the case is that excitement and spleen must have unhinged his mind as they certainly warped his nature and blasted his career. Those who have met him speak of him as the pleasantest and brightest of companions, boundless in hospitality and generosity. The awful penalty of the law should hush unkind comment. We will only deplore the condition of a state of society in which such events have been possible.

THE PROVIDENCE DOG SHOW.—Providence, Feb. 14. *Editor Forest and Stream:* The following-named gentlemen have agreed to act as judges at the Rhode Island Kennel Club bench show, March 29-April 1. English setters and pointers, Dr. Wm. Jarvis, Claremont; N. H.; Irish and Gordon setters, Mr. H. C. Glover, New York, who will also be veterinarian; collies and beagles, Dr. J. W. Downey, New Market, Md.; all other classes, Mr. C. H. Mason, New Rochelle, N. Y. The list of special prizes will be announced as soon as completed.—NATHANIEL SEABURY, Sec'y.

MASTIFF SWEEPSTAKES.—Feb. 12.—*Editor Forest and Stream:* The first mastiff sweepstakes, for puppies born in the United States or Canada, on or after March 1, 1886, for competition among members of the American Mastiff Club, will be decided at the third annual bench show of the New England Kennel Club, held at Boston, April 5, 6, 7 and 8, 1887. Entries close March 15. Entrance, $5 each, to be paid to the secretary of the American Mastiff Club at the time of entry.—RICHARD H. DERBY, Sec'y. (9 West Thirty-fifth street, New York city).

RIVERVIEW KENNEL.—Clinton, Mass., Feb. 4.—*Editor Forest and Stream:* Mr. Bates, of Shaw & Bates, has sold his interest in the Riverview Kennel to me, and I will thank you if you will announce the fact in your kennel department.—CHAS. E. SHAW.

KENNEL MANAGEMENT.

☞ No Notice Taken of Anonymous Correspondents.

E. E. L., Boston.—1. What will remove a doggy or strong odor from a St. Bernard? She scratches herself some, but has no mange. 2. Is there a book published on St. Bernards a treatise or treatment of? Ans. 1. Give five drops of Fowler's solution of arsenic twice daily in the food, and wash every two weeks with carbolic soap. 2. None specially devoted to the breed.

A. B. C.—Kindly give recipe for making a gallon of mange cure. Dog has had it on and off for a year. Difficult to cure. Ans. One of the best cures for mange is 5 drops of Fowler's solution of arsenic and 3 grains of the citrate of iron and ammonia given together night and morning in food. Your druggist will make it up in any quantity you desire.

SAGAMORE.—One of my setter puppies, 8 weeks old, weeps continually in both eyes. On examination I find that the lower lids are turned in so that the hair causes constant irritation. As yet no purulent discharge has occurred. I wash with borax and camphor. Would it be necessary to have a surgical operation, or do you think the lids will come right in time? Ans. An examination would be necessary to answer your question. You had better have an oculist look at the puppy. It might be possible to pull out some of the lashes which are causing the trouble.

KENNEL NOTES.

Notes must be sent on prepared blanks, which are furnished free on receipt of stamped and addressed envelope. Sets of 200 of any one form, bound for retaining duplicates, are sent for 30 cents.

NAMES CLAIMED.

☞ Notes must be sent on the Prepared Blanks.

Hardee, Purdee and Atmee. By E. S. Bettelheim, New York city, for two black collie dogs and one black and white collie bitch, whelped Dec. 16, 1886, by Notre (Nector—Julie) out of Madame Angot (Charles II.— ——).

Furness's Jet Obo. By W. J. Furness, Ogdensburg, N. Y., for black cocker bitch, whelped July 7, 1886, by Obo II. (A.K.R. 432) out of Critic (A.K.R. 303).

Trixcy. By Geo. Ayers, Providence, R. I., for liver and white pointer bitch, whelped Dec. 28, 1886, by his Dick out of ——.

Little Pompey. By G. L. Tarr, Hopedale, Mass., for black cocker spaniel dog, whelped Oct. 2, 1886, by Black Pete (A.K.R. 3071) out of Marie (Obo II.—Gem).

Lady Vinnie. By E. A. Hawes, Newark, N. J., for lemon and white pointer bitch, whelped Aug. 8, 1883, by Joe out of Underhill's Jane (Sensation—Lill).

Floss. By G. L. Tarr, Hopedale, Mass., for liver and white cocker spaniel bitch, whelped July 18, 1884, by Scribner (Spider—Cute) out of Smudge (Col. Stubbs—Mollie).

Smudge. By G. L. Tarr, Hopedale, Mass., for liver, white and tan cocker spaniel bitch, whelped July 19, 1881, by Col. Stubbs (Captain—Flirt) out of Mollie (Dash—Topsy).

NAMES CHANGED.

Bess Obo to Kiddy Obo. By Dr. J. J. Wheelock, Waterbury, Vt., for black cocker spaniel bitch, whelped March 24, 1886 (A.K.R. 4092).

BRED.

EXPERIENCE WITH REVOLVERS.

Editor Forest and Stream;

Allow me a little space in your valuable paper to inform its many readers, and especially the gentleman from New Haven, who, in the issue of Feb. 3, asked regarding the market of a neat, well-balanced, well-made and accurate shooting revolver, what I have found out concerning revolvers by actual experience. I do not wish any one to infer from this that I am engaged in a business that requires a revolver constantly at hand, for such is not the case, but I consider myself one of those individuals who can get considerable amusement out of target shooting (especially when I score several bullseyes), and from this standpoint I wish to be viewed.

I have been on the lookout for several years back for such a revolver as the New Haven writer spoke of, and am happy to say that I think that I now have in my possession a revolver that will "fill the bill." But this was secured only after a great many disappointments. First I bought a pocket rifle, and this cheap concern soon convinced me that it was not what I wanted. The barrel only had three rifles, or what was intended for three rifles, but to me and my comrades it looked like a three-cornered hole. The trigger pulled at between 8 and 9lbs. and the balls would not go through an inch board at ten paces and more, three out of every five struck side ways. This weapon was .22-cal. and gloried in the name "Essex," and I sold it at "greatly reduced prices."

Next this I turned to a four-barreled Sharps, then to a Standard, then a "Bulldog," next "Rangers," "Blue and Red Jackets," "Czar" and almost any of that sort you might name, until finally my comrades and myself determined to invest in Remington's .38-cal. two cylinder revolvers.

We soon decided that the cartridge cylinder was a nuisance as none of us could hit a barn with it, and so we determined to test the loose-ammunition cylinders to the utmost. At first we loaded them full and had the same result as with the cartridges. With those loads the revolvers had an awful desire to wrench themselves from our hands, so we came down the scale on the powder and were not long in discovering an equal decrease in the recoil. In this manner we experimented for some time and finally decided that between 8gr. and 10gr. of powder was the proper charge for our revolvers, and we procured the smallest powder cans we could and "doctored" them so as to measure this charge, and also provided small brass punchers to seat the bullets on the powder.

We used round bullets and carried them in tin boxes, bullets well greased in cocoanut oil, and with this equipment we did considerable shooting, for the simple reason that it was cheap.

At this time we were not very much on target-shooting, although fine shooting could be done with these revolvers, for they were well balanced, and not over-loaded. One of my friends could hit a nail-head at ten paces every once in a while.

We spent most of our time and ammunition shooting at fruit cans, tossed into the air, at about six paces, and we considered ourselves pretty fair shots when we could show five or six holes in a can out of a round of six shots. For a long time I considered this the revolver of revolvers, and the one I had been looking for, but I soon tired of its slowness in reloading, its looks, and for these and several other reasons it soon parted company with me. One of comrades purchased a Smith & Wesson .44-cal. Russian model, and after firing it several times I knew that was no revolver for me, it being the same old story of too much "kick." After considerable time and trouble I managed to satisfy my desire to get such a revolver as I had pictured in my mind as a good one, and I feel confident that I now have in my possession the king of the revolver tribe, at least of the tribe now in existence.

I wrote an arms company in St. Louis asking if they could furnish me with a Smith & Wesson .32-cal. revolving rifle with the barrel cut off to eight or nine inches in length, and their answer was in the affirmative, which resulted in me having the revolver now about to be described and praised.

This was only intended for another experiment, but I will now say that if I am not able to become an expert shot with this revolver I never will with any other.

This weapon weighs nearly 3lbs., has rifle sights that can be elevated to suit distances, and in my eyes it is stylish, and to my hand it seems pretty well balanced.

The cartridge I use is S. & W's. .32-cal. rifle, which uses 17gr. powder and 100 lead, about as well-proportioned revolver cartridge as there is on the market. One great advantage of this cartridge is that it extends to the mouth of the cylinder thereby preventing the ball from tipping before entering the barrel. Other advantages of this shell are that you can load according to the kind of shooting that you want to do, without using wads, the shells can be carried loose in a pocket without greasing it all over, and they are quickly and easily reloaded. I can also use the small .32-cal. S. & W. cartridge in my revolver. Regarding the "well-building" of this revolver I need say nothing, as everybody knows what Smith & Wesson can do in that line.

As to penetration, I will mention that I have shot through six ⅞in. pine boards, which I should think would be force enough for a target revolver. The trigger pull can be hardened or lightened at will by turning a small screw in the hammer.

Now for the final and most important part of the business—the accuracy of this revolver. I have not had it long enough to become very expert at target shooting, and I know it will never do any remarkable shooting in my hands, as I am none of the best at this business by a long way, but all you have to do is to hold it right on the bullseye, as fine as possible, making no allowances of any kind, and you may be sure the bullet goes straight. Poor as I am at a target, I have made several respectable-looking scores at 12 paces, and have hit a cent at 50 yds. on two different occasions. I always stop shooting when the first two or three shots hit the center for fear of spoiling the target.

Shortly after procuring my revolver I saw that S. & W. began to make their .32s and .38s with extra length barrels, and one of these I would have had, had I not been equipped already. As it is now, I would not trade even, for I think mine far superior to their common revolver, with or without extra length barrels, as to my mind weight is the most important factor in true shooting, and I surely have it in my favorite. What I would like to see would be my revolver, or one similar, in the hands of a good revolver shot, and I am sure the result would substantiate all I have written about it.

One word about lubricating. I read of a good many persons in your paper in search of something to prevent a rifle from leading, and to such I would say use more lubricant, as most leading is caused by the balls being too dry or shooting too often without cleaning. I use cocoanut oil, which resembles vaseline very much, to grease the bullets of my revolver and rifle. This oil melts more readily than tallow and I have used it for the last five years with the best of success. In greasing the rifle bullets I do as the Winchesters advise—only dip the ringed edge, but in my revolver I use the dry ball and then fill the shell even full of the hard oil.

I take greater delight in shooting at flying objects with a revolver than at stationary ones and in this pastime the most of my ammunition has been expended. Experness with the revolver in this direction is not so easily obtained as one would think, for a good many things have to be taken into consideration. The hitting of a silver dollar at 10 paces with a rifle or the smashing of clay-pigeons with a shotgun are easy compared to the hitting of a dollar at 6 paces with a revolver. I have spent considerable time and ammunition in all three of these branches of shooting and I know whereof I write. SIPPO.

WHITE CITY, Kas., Feb. 10.

RANGE AND GALLERY.

SPRINGFIELD, Mass., Feb. 12.—The weekly shoot of the Rod and Gun Rifle Club was fairly well attended to-day, nine members being at the range and taking part. The shooting of Mr. Z. C. Talbot with his new Bullard .22cal. c. f. was quite a surprise to the members present. His rifle was not finished until noon, and he called at the factory on his way to the range and took it with him and a box of Union Metallic ammunition, .22-10-45, his first string of 10 shots being 61, and his second 35 on the Hinman target. The day was poor for rifle shooting, it blowing a perfect gale, some of the marksmen using 4½ points windage. Mr. Talbot used an open front sight. T. T. Cartwright used a .22cal. Bullard that had never been fired out of before he shot it at the range. In fact, the rifle was in a rough state, just as it left the machines. He used 48 grains powder and 185 grain bullet patched. He made 8 consecutive bullseyes the first 10 shots, fired off-hand. The target used was the Hinman, at 200yds., off-hand.

	Record Match.									
T T Cartwright	9	10	8	8	8	8	6	3	8	7—75

Prof Martin	4544344545—42	C J Bell	5434333334—35
Chas Schreiner	4454534444—41	L Bell	5444444445—42
J S Weaver	4443444444—39		

THE NATIONAL RIFLE ASSOCIATION at its meeting in Temple Court, Tuesday, elected Gen. G. W. Wingate President, and John B. Woodruff Vice-President. The report of the Committee on Range consisted of the introduction of a resolution that in view of the difficulty of raising the funds required to fit up a new range it was inexpedient to discuss the matter further at present. Laid on the table. The committees appointed were those on Prizes, consisting of Col. John Ward, Major Duffy and Major Fox; on Finance, Col. Bridge, Capt. L. C. Bruce and Mr. Duane; on Range, Gen. Robbins, Major Shorkley, and Lieut. Zalinski, and on the Annual Programme Mr. Shepherd, Mr. Duane, Major Bell and Lieut. Zalinski. Capt. Louis Wendel, of the First Battery, was elected a life member.

THE SECOND BULLARD MATCH.

SPRINGFIELD, Mass.—*Editor Forest and Stream:* Inclosed find scores made by the various rifle clubs and military companies of the United States and Canada in our match No. 2 for the Bullard single shot target rifle at 200yds. off-hand. The severe winter weather interfered with many of the clubs shooting. The scores are lower in nearly all cases than in the previous match. The winning club will be seen by reference to the scores, is the Ingersoll Rifle Association, of Ingersoll, Canada. Five of the team used a military rifle, and five sporting rifles. The following used the military rifle: Messrs. Henderson, Beck, A. A. Henderson, A. J. McCarty and H. McInnis; their scores being 80, 84, 79, 77 and 68 respectively, which we believe are the highest scores ever made by five men, 10 shots each in a match with military rifles. The only full score, Creedmoor count, made during the two matches was made by Mr. E. F. Richardson, of Lawrence, Mass., whose 92 points was a full score, Creedmoor, and his fourteenth full score Creedmoor; he used his .32-cal. Bullard single shot, using 40 grains powder and 185 grains patched bullet, 8lbs. rifle. The details for the second series will soon be completed and published in the sporting papers. NEW YORK, Feb. 7, 1887—C. G. Zettler, Esq., No. 207 Bowery.—Sir—On behalf of the New York Rifle Club I challenge your club to a friendly gallery match to take place at 8 P. M. Thursday, Feb. 17, at Twelfth Regiment Armory, Broadway and Forty-fifth street. Teams—10 men from each club, 10 shots per man; rifle any .22cal. under 10lbs. weight and over 3lbs. trigger pull. Would shoot a return match at your gallery, or such other place in New York as would be agreeable to you. Please let me know your decision as soon as possible, I can settle minor details with your captain. Yours, etc., JAMES DUANE, Captain N. Y. R. C.

The above has been accepted by the Zettler Rifle Club, but date and place changed to suit the convenience of the N. Y. R. C. to Friday, Feb. 18, at Zetter's rifle gallery, 207 Bowery. Return match at Twelfth Regiment Armory, date to be named hereafter.

On Feb. 8, a 100-shot match between Messrs. Walther and Dorler was shot for shoes and hats. Result as follows (possible 1,200):

B Walther	115 119 118 115 117 113 116 114 115 118—1160
M Dorler	117 117 115 117 115 113 112 112 115 113—1146

W.

LAWRENCE, Mass., Feb. 12.—At the regular weekly prize shoot of the Lawrence Rifle Club this afternoon the following were the best scores, 200yds., off-hand, standard American target:

O M Jewell	10	8	10	10	10	6	9	9	7	10—89
C M Hill	7	9	10	8	9	9	6	8	6	8—80
J W Bean	5	6	5	7	10	8	10	7	9	10—77

SAN FRANCISCO, Jan. 30.—The monthly medal shooting of the National's shooting

NEW JERSEY SHOOTING.—The match between L. R. Campbell, of Little Silver, and W. W. Lever, of Elizabeth, came off on the 8th inst. at the grounds of the Middlesex Gun Club, Dunellen, and proved quite an exciting affair. Considerable money changed hands, the betting being largely in favor of Campbell; in fact, until the 25th bird was shot at the odds were 10 to 4. Campbell became demoralized and missed his 28th, 29th and 30th; he also lost one bird shot on the ground and one dead out of bounds. The following is the score at 35 birds, 30yds., one barrel, gun below elbow, 5 traps, Campbell furnishing all the birds. Quinlan judge for Lever, Van Schaick judge for Campbell, John Bishop, referee; John P. Day, trap puller; W. J. Ritch, scorer:

Campbell.....0111111111111101100101111010011010—24
Lever.....1111101011001111111111101011011101—26

Campnell had 16 drivers, killed 13; 6 incomers, killed 6; 6 right quarterers, killed 2; 7 left quarterers, killed 3.

Lever had 14 drivers, killed 9; 6 incomers, killed 5; 5 right quarterers, killed 4; 10 left quarterers, killed 8.

They were a fair lot of birds, and considering 30yds., 5 traps, 1 barrel and the excitement, the shooting was good.

The regular monthly shoot for the cup of the Jersey City Heights Gun Club took place on their grounds at Marion on the 10th inst., and was as usual a pleasant affair. Previous to the shoot for the cup and to get the boys in good trim the following sweeps were had: First sweep, 3 birds, $2 entrance, J. C. H. G. C. rules:

W Siegler	1 1½—2½	W Taylor	1 1 1—3
Hughes	0 1 1—2	W Terry	1 1 1—3
Collins	1 1 0—2	Blauvelt	1 0 0—1
South Paw	0 1 1—2	Cummins	1 0 1—2
Quinlan	0 0 0—0		

Taylor and Terry divided first.

Second sweep, same conditions.

Collins	½1 0—1½	Cummins	1 0 1—2
Quinlan	1 1 1—3	Hughes	½1 1—2½
Terry	1 1 1—3	Ritch	1 ½0—1½
Taylor	½0½—1	J Von Lengerke	1 0 1—2
Burdett	1 0 1—2	J Wrong	0 0 1—1
Siegler	1 1 1—3	Lager	0 0 0—0

Ties divided.

Third sweep same conditions.

Collins	0 0 1—1	Blauvelt	1 1 1—3
Quinlan	1 0 0—1	Burdett	1 1 0—2
Taylor	1 1 1—3	Jones	1 1 1—3
Hughes	1 0 0—1	Siegler	1 1 1—3
J Von Lengerke	0 1 1—2	Moritz	½1 1—2½
Cannon	½1 1—2½	Badgely	1 0 1—2
Cummins	0 0 1—1	Ritch	1 1 1—3
Terry	0 1 1—2		

Fourth sweepstake, same conditions:

Cannon	½1 1—2½	Burdett	1 1 0—2
Siegler	0 1 1—2	Collins	1 0 1—2
Quinlan	1 1 0—2	Badgely	1 1 1—3
Moritz	1 0 0—1	Hughes	1 1 1—3
Lindsley	1 0 1—2		

Fourth regular shoot for the cup for the year:

Quinlan, 28yds.	1 1 1 0 1 0—4	V'n L'g'e, 27yds	1 1 1 1 1 0—6
Siegler, 28yds.	1 1 0 0 1 0—3	Lager, 22yds	1 1 0 0½ 1 0—3½
Heritage, 26yds	0 0 0 0 w	Taylor, 27yds	1 1½½ 1 0 0—4
Cannon, 27yds.	½ 1 0 0½ 1 0—3	Cu'mins, 25yds.	0 1 1 1 1½ 0—4½
Cramer, 27yds.	0 0 1½ 1 1 1—4½	Lindslay, 26yds.	0 1 0 0 0 1 w
Burdett, 25yds.	0 0 0 1 w	Wrong, 23yds	0 1 0 1 0 w
Terry, 23yds	1 1 0 0 1 1—5		

Von Lengerke cup and first money, Terry third, Cramer and Cummins divided third.

They were a magnificent lot of birds, never better on the Jersey grounds, and they beat the guns badly. They were the get-up-and-get kind. Some of them twisters and grounders and good carriers of lead, especially until they got just beyond the boundary.

There is expected to be a big time at the Middlesex Club tournament, at Dunellen, next week. I hear from one of the members of the Middlesex committee that they now have 12 and they confidently expect to have 16 or 18 entries for the big $112.50 sweepstake on the 22d. I hope to be there.—JACOBSTAFF.

CHATHAM, N. Y., Feb. 12.—Chatham Center Gun Club's first trial of shooting from the trap, and it was a cold, windy day. Match at 100 Peoria blackbirds, 21yds. rise, New Long Island rules:

Milton Powell	1111100110—7	F M Fowler	0000100010—2
Jesse Goodrich	0000010000—1	George Bogardus	0000000000—0
A B Chichester	0000000000—0	Charles Minsee	0101000010—3
J V Williams	0100000000—1	Bert Lamberee	1101111111—9
A H VanAlstyn	0100000000—1	E T More	0100100010—3

The officers of the club are: President, J. J. Wilbur; Captain, Milton Powell; Secretary, A. B. Chichester; Treasurer, J. D. Goodrich.

SAN FRANCISCO, Jan. 30.—Today John Ferguson, of San Francisco, and H. L. Harland, of Pleasanton, shot a match at twenty single birds, 30yds. rise, Hurlingham rules, for $50 a side, at Bird's Point, Alameda. The morning was foggy and the birds hung on the trap, the majority of them being incomers, but still the shooting was above the average. Off the twenty birds both men killed eighteen and tied, when it was agreed to shoot off the tie at four singles. Again the men tied, and as neither one felt much confidence in beating the other it was agreed to call it a draw. The money was then returned by the stakeholder. W. L. Eyre acted as referee and referee. Messrs. Ferguson and Feltis shot a match against Messrs. Harland and Bardolph at six birds, $5 a side. The first match resulted in a tie, and the stakes were doubled and a similar match was shot over again, Ferguson's side winning. In a similar match under the same conditions Ferguson's side again won by two birds.

TORONTO, Feb. 10.—The West End Dog Sports and Gun Club had an afternoon's shooting to-day on the grounds of the Dufferin Hotel. The weather being fine there was a large turnout of members. The competitors were divided into two classes, the first of which, it will be seen by the undermentioned scores, did some rattling good shooting. First class—At Peoria blackbirds, 21yds. rise, 15 birds each: Dollery 15, Bailey 14, Brown 13, Clark 12, Wilson 11, Carruthers 10, Davies 8. Second class—At Peoria blackbirds, 21yds. rise, 10 birds each: Spiller 7, Beatty 7, Howell 6, Hill 6, Boswell 4, Bull 4, Tonnersall 4, Gorman 2, Gentleman 2. In shooting off their ties at 7, miss and go out at 24yds. rise, Spiller hit 2 and Beatty missed his second; the former, therefore, took first prize.

WELLINGTON GUN CLUB.—The Wellington Gun Club held its regular weekly shoot on the 12th, and the pleasant weather brought a large number of gunners to the grounds. In the medal match, Shumway won in Class A, Bancroft in Class B, and Haskell in Class C. Following are the winners in the other events: 1. Swift and Ames first. 2. Shumway first. 3. Shumway first. 4. Stanton first. 5. Swift first. 6. Bancroft, Nichols and Stanton first. 7. Shumway and Stanton first. 8. Haskell first. 9. Swift first. 10. Stanton first. 11. Swift and Stanton first. 12. Stanton and Haskell first. 13. Shumway and Stanton first. 14. Stanton and Snow first. 15. Stanton and Snow first. The Wellington club will hold an all day shoot on February 22, and on February 24 a picked team will visit Brockton to compete with a local team there for the Massachusetts glass-ball badge.

BROOKLYN, Feb. 10.—The Unknown Gun Club, of Brooklyn, had a shoot to-day at Dexter Park, L. I., which was remarkable for the number of shooters. Twenty-six names were put down to compete for the prizes. The shooting was not first-class, as out of the 196 birds shot at, 98 escaped the gunners. The first prize was won by J. Tomford, 25yds., with a clean score of 7 straight kills. H. Knebel, Jr., 25yds., won the second with 6 out of 7, and R. Monsees, 25yds., the third, with 8 out of 10, after tieing with four others. The scouters had a good time.

HYDE VS. HALL.—In a pigeon shooting match at Bartow-on-the-Sound on Feb. 10, Ike Hyde, the noted Long Island wing shot, defeated J. Hall, an Englishman, by a score of 17 to 13 out of 18 pigeons shot at by each. They shot under Hurlingham rules at 50yds. rise, for a stake of $200. Considerable money changed hands.

KNOXVILLE GUN CLUB.—Knoxville, Tenn.—The officers for 1887 are: Sam B. Dow, President; J. W. Slocum, Treasurer; C. M. Woodbury, Secretary.

HAMMOND, Ill., Jan. 20, 1887.

U. S. Cartridge Co., Lowell, Mass.:

DEAR SIRS—To-day I made a test of shells and settled in my mind a long disputed fact in regard to the amount of times the U. S. shells could be reloaded. I took five shells from a box of 100, and shot them as fast as I could get them reloaded. The following is the result: First shell, 9 times; second, 14 times; third, 10 times; fourth, 13 times; fifth, 9 times. I could have loaded and fired some of them again, but the above result settled the question of their reloading qualities in my mind. I am sure all hunters and shooters ought to know of the good qualities of this shell; and I give you liberty to publish this, and will further say I am not in any way interested in any shell company, and give this letter for the benefit of all sportsmen. I am sure we are all seeking for the best, and if I can assist any one to find the best I will gladly do so, and this is my reason for sending your company this letter. Wishing you every success, I am, yours truly,

*** (Signed), L. S. CARTER.

Canoeing.

A. C. A. EXECUTIVE COMMITTEE.

PURSUANT to the call of the Commodore a meeting of the Executive Committee of the A. C. A. was held on Feb. 12 at the rooms of Mr. William Whitlock, in New York. The members present were Com. Wilkin, Vice-Com. Gibson, Rear-Com. Barney, Pursers Brown and Davidson, and Messrs. Parmele and Whitlock of the Executive Committee, besides Mr. C. B. Vaux, of the *Canoeist*, Mr. W. P. Stephens, of the FOREST AND STREAM, and Mr. Matt Angle of the Rochester C. C. Mr. Whitlock was appointed secretary pro tem. Much business was transacted, the details of which will be given as soon as the secretary's minutes are revised. The principal action taken was the election of a secretary-treasurer in place of Dr. Neidé. Mr. Whitlock nominated Mr. Wm. M. Carter of the Crescent C. C. of Trenton, N. Y., seconded by Vice-Com. Gibson, and Mr. Carter was elected. A letter was read from Mr. E. B. Edwards of Peterboro in regard to the formation of a Northern Division, whose boundaries should not be political, but which should, if possible, embrace both shores of Lake Ontario.

Messrs. Gibson, Parmele and Brown were appointed a committee to further amend the constitution to meet the growing want of the Association. The following recommendation was made to the committee: That they devote special consideration to the limiting of A.C.A. expenses to a minimum for the publication of annual book and of camp programme, and the payment of actual disbursements by officers and committees for preparation of camp, the payment of secretary's expenses and disbursements, and for the hire or construction when necessary of a landing place, an official A. C. A. marque and proper sanitary camp arrangements. All other camp requisites such as steamers, store, camp fires, etc., to be made self-supporting, remembering that it is the policy of the A. C. A. to return as soon as possible to the rate of subscription of $1; the committee to consider the practicability of holding a meeting of new executive committee at the annual camp to elect a commodore and to do general business; new commodore not to assume office, however, until annual meet.

That the committee be instructed to give the fullest publicity to these suggestions.

The following were also carried: That the A. C. A. hereby extends a cordial invitation to the W. C. A. to unite as a Western Division of the Association, making such proportionate contribution to the general fund as this and the other divisions may, with the A. C. A., mutually agree upon.

Further, that the secretary-treasurer be directed to communicate this invitation to the secretary of the W. C. A., together with a copy of the resolution directing the committee on constitution to consider the desirability of returning to the rate of subscription of $1.00.

The committee will proceed at once with the work of revision.

A "NEW INVENTION" FOR CANOEISTS.

CANOEISTS are by no means ungrateful, and are willing to make every acknowledgment in aid of those inventors whose skill or ingenuity has been exercised in their behalf, but there is little doubt as to the way in which they will receive the latest benefit that has been conferred upon them. It takes the shape of an "invention" patented by the "inventor," Mr. W. N. Griswold, of New York, and described by him as follows:

"*A.* Represents reef boom, made of good tough material. When in use the reef boom is inserted in a pocket formed by stitching a cloth of the same material as the body of the sail at the reef band, flat. This pocket should be no longer than required to take the boom. The boom need be no larger than say one-quarter the diameter of the main boom, as every inch of it is braced by the sail. The boom is fitted with a jaw of wood or rod iron as thought best, which, when the boom fits on the mast, prevents springing forward.

"*B.* Represents the down hauls, which also act as spilling lines as the sail comes down—in numbers as found convenient—passing through thimbles set in the sail, OVER and CLOSE to the reef boom, with the standing part made fast to the main boom on one side, and the running part through cleats or thimbles attached to the main boom on the other side, then to a block at the mast, and then aft to the hand of the man steering, or made fast to cleats on centerboard, trunk or rail. *C.* represents main boom. *D.* represents mast.

"This invention explains itself at once to the eye of an expert. First—At all times and under all conditions, the sail is under the absolute control of the man at the tiller. Without leaving his seat, without losing steerage way, at a moment's notice, he can put his boat or canoe under short sail, or from short sail make all sail WITHOUT LEAVING HIS SEAT. ALL that he has to do is to slack away the halliards and take in the slack of the down hauls. When the reef boom is down on the main boom, make fast down haul—then the sail is reefed. To make sail—let go the down hauls and hoist the sail up. All this can be done with the boat ON or OFF the wind without changing course. Second—The boat or canoe can be sailed closer to the wind by one-half point, for the reason that the 'bag' is taken out of the sail by the reef boom. Third—The boat or canoe can be handled—no matter how large—BY ONE PERSON, for the reason that no earrings are to be pulled out or reef points tied. There is no drifting off to leeward, rolling in a sea way, anchoring or running ashore to shorten sail. In a moment the work is done without the trouble or the danger always attendant reefing as in the past.

"Parties wishing information will have it gladly extended them on application, either in person or by letter.

"The expense of rigging a boat or canoe with the boom is merely nominal, rarely exceeding $5 or $6."

The illustrations are merely very crude cuts of two boats with battens in their sails and the vertical parts of the reef lines shown, without blocks, rings or other gear. Accompanying this modest document is the following which will be still more interesting to the hundreds of canoeists, yachtsmen and boating men who have used battened sails in America for the past eight or ten years, both with and without reefing gear attached:

NEW YORK, Feb. 9, 1887.—Mr. ——, I enclose herewith circular describing the Patent Reefing Invention of W. N. Griswold. The patent has been examined by some of the most expert patent lawyers in this country, who have pronounced it perfectly good, and *controlling* in all cases where a sail is reefed by the use of wooden sails or booms, one or more, set in the sail. The royalty paid by large vessels, per year, is $5 and upward for each sail upon which the invention is applied. For canoes, the royalty will be $2.50 per year per sail. I am informed that you are using it; if so, please call here and receive a license to use the patent, which will be given on payment of the royalty. An early answer will oblige your obedient servant, G. S. VAN PELT, Attorney and Counsellor at Law, 71 Broadway.

These two circulars have been sent to canoeists in Newburgh, Hartford, New York and elsewhere; now step up, gentlemen, and pay from $10 to $15 per year for your racing and cruising rigs, to this benefactor of the sailing world. Mr. Griswold's patent, recorded in the *Official Gazette*, vol. 21, pp. 383, is numbered 253,371, and was applied for on Dec. 5, 1881 and granted Feb. 7, 1882. To go into the history of the batten sail is unnecessary, it is well known that the idea was derived from the Chinese and has been in general use in England for a dozen years. Several methods of rigging it were described in the first edition of "Kemp's Yacht and Boat Sailing," in 1878, while two years previously, in 1876, the Nautilus canoe with battened sails and reefing gear was illustrated in a large plate in "Yacht Designing" by the same author. Later, in 1879, a series of articles appeared in the *London Field*, from the details in which Mr. W. P. Stephens, at Rahway, New Jersey, in the winter of 1879-80, rigged the pearl canoe Queen Mab, with two sails having three battens in the mainsail and a hand-reefing gear on the lower batten; and for four years he continued to rig, use and sell sails rigged in the same manner. In *Brentano's Monthly* for May, 1880, Mr. Stephens described the batten lug sail as used by Messrs. Baden-Powell and Tredwen, with reefing gear, the battens being shown in the accompanying illustrations. The description is as follows: "They (battens of light wood) are inserted in pockets sewn across the sail, as at (b), and are parreled to the mast, the reefing points being made fast to them, or else a reefing gear is rigged, so that simply pulling a line while halliard is eased off takes a reef snugly in." In the spring of 1881 Mr. Stephens also issued a catalogue of canoes in which the same gear was fully illustrated. The batten in the sail may be traced further back and is of general application, being used on the yawl yacht Emerald in San Francisco.

In an interview with Mr. Griswold he professed an entire ignorance of any published description of the device as well as of the literature of the subject, including the standard works we have mentioned, and he also stated that his device had been approved as a valuable novelty by the boat clubs of Staten Island, the very spot where it was first generally used in American canoes two years before the date of his patent. He claims that the device has been passed upon by experts and the patent pronounced good, and declares his intention to enforce his asserted rights, but offers now to make liberal terms with those who are willing to recognize them.

The principle involved, however, is one that every sailor in the country is directly interested in, as if Mr. Griswold's patent can be sustained it opens a wide field to "inventors" who possess a similar ingenuity and search as diligently into the previous history of their devices. If the batten is patentable then the mast, the gaff, the oar, or the tiller must come under the same ruling.

THE LOSS OF THE ZEPHYR.

Editor Forest and Stream:

I at first concluded to make no mention of the loss of my son's canoe, but on reflection, as time has softened the excitement and distress of the occurrence, I see that it may be a service to some young members of the fraternity. If the boys can only be persuaded that they are not expected to sail for all they are worth every time they get into their boat, but to go along slowly and comfortably, much of the risk would be overcome. The Zephyr was, I think, about the first sailing canoe brought to this coast; I got her just about ten years ago—in October, 1876—and she had been here a year or two I think. She was considered about the prettiest model in our fleet and has made the best time over our racing courses. W. W. BLOW.

OAKLAND, Cal.

Doubtless one would think that after the rough treatment the O. C. C.'s received in their trip on the bay when the Spray was lost and the other craft suffered such humiliation is that these canoemen would be a little shy of these treacherous waters. But it required yet another lesson and it was taught as follows: On Nov. 21 Mystic, Flirt and Zephyr set out with a fair wind and tide to go to Goat Island. There was just a good lively breeze, which made a reef comfortable, and starting about 11 in the morning a nice run was made for a mile or so down the creek, when the breeze died out. As the tide was favorable and would turn about 2:30 P. M. to come back with, our voyagers kept on under paddle. But not for long, for soon a catspaw from N. W. came creeping over the water, gradually increasing. With a hitch and a leg they soon reached the mouth of the creek, and by this time the wind and adverse tide had kicked up a nasty sea. Flirt and Mystic stopped to consult, and after reefing, concluded the outlook was too risky for a pleasure trip. Zephyr, meanwhile, sailed by the Commodore's 15-year-old son, had made several tacks out into the bay, and was clear out of hailing distance. The wind had been steadily increasing and Flirt had squared away for the creek.

Zephyr had probably gotten nearly a half mile away and to windward, with never a fancy but that the larger boats were behind. Mystic had just finished tying in a close reef, and commenced to draw ahead, hoping to be able to overtake the youngster and perhaps be of service in the rough weather, when Zephyr, looking back, noticed the Flirt squaring away and Mystic apparently waiting for him to come back. By this time the wind was blowing a gale, and the boy's only chance to turn was by lowering sail. The Zephyr, 14ft.x28in., had small chance of keeping right side up, sailing with that wind and sea behind her, and scarcely had the youngster attempted to fill away before she went like a flash. It was a cold, raw day, and it seemed as if nothing but a miracle could save the boy. Frantically Mystic yelled to Flirt (who by this time was well to windward) and signalled in the direction of the capsize. Taking in the situation immediately, the gallant little Briton brought his boat up into the wind and dashed to the rescue. If ever men prayed and toiled, those two in the Flirt and Mystic did in the endeavor to save that life. Imagine it! a little fellow, fifteen years of age, out in the middle of San Francisco Bay, fully a half mile from the nearest landing, capsized in a gale of wind and on a miserable cold day. Imagine the father's feelings to have witnessed the whole proceeding and with no help but these frail canoes in sight. But they did not despair; with coolness and determination they pressed to the rescue, the Flirt impelled by the bravery and fidelity of a true man, the Mystic by the tie of kinship, to save his first born and only son.

From Flirt's position at the start, she was enabled to head up nearly to where the lad was struggling, while Mystic had to make several tacks. The boy held to the canoe as best he could at first, but was washed off several times. He then found she was getting loggy and finally began to sink, and seeing the other boats coming to him concluded to swim for it. He managed to get his coat off and struck out. Fortunately he had been taught to swim early, and was a strong swimmer. The first that Flirt saw of him he had thrown his arm up as he mounted a wave and hallooed for help about a hundred yards off the port beam. Promptly the Flirt went round on the starboard tack, and a few minutes later was put back on port tack with a few feet of the now thoroughly exhausted lad. Carefully Flirt approaches. It is not so easy to take any one into a canoe from the water, especially when lashed to a foam in a gale of wind. He reaches a paddle out but the boy is so weak he cannot grasp it. Finally, by laying out on deck he can just reach him with his hand, and balancing to a nicety drags him into the boat. All honor to the skipper of the Flirt, for he has saved a life at the risk of his own. All this is witnessed from the Mystic, a hundred yards or so astern.

The rest is soon told. With grateful hearts they fill away for home, and arrive there safely after a rough run before the gale. The boy is a strong lad, and in a day or two fully recovered from the shock and excitement. The poor little Zephyr has not since been heard of.

Now there are some useful lessons to be taken to heart from this mishap. First, let all canoemen devote much time to practice of swimming; next, be absolutely certain of the quality and sufficiency of air tanks. Those in the Zephyr were known to be defective, but they were to have been improved. Say to all canoeists, don't go out another time until you have the floating capacity of your boat assured. And be sure your rigging is all right. The boy said he tried to take the sail down, but the halliards stuck in the blocks, wouldn't run free.

Also enter a plea for larger canoes and smaller sails. Most of the canoes here are 33 to 36in. beam, and they are small enough for comfort and safety. Of course it will be a difficult matter to persuade the racing paddlers that there is any fun paddling so heavy a craft. But when you are cruising go a little slower, that's all, you'll get there all the same, and be much more comfortable all around.

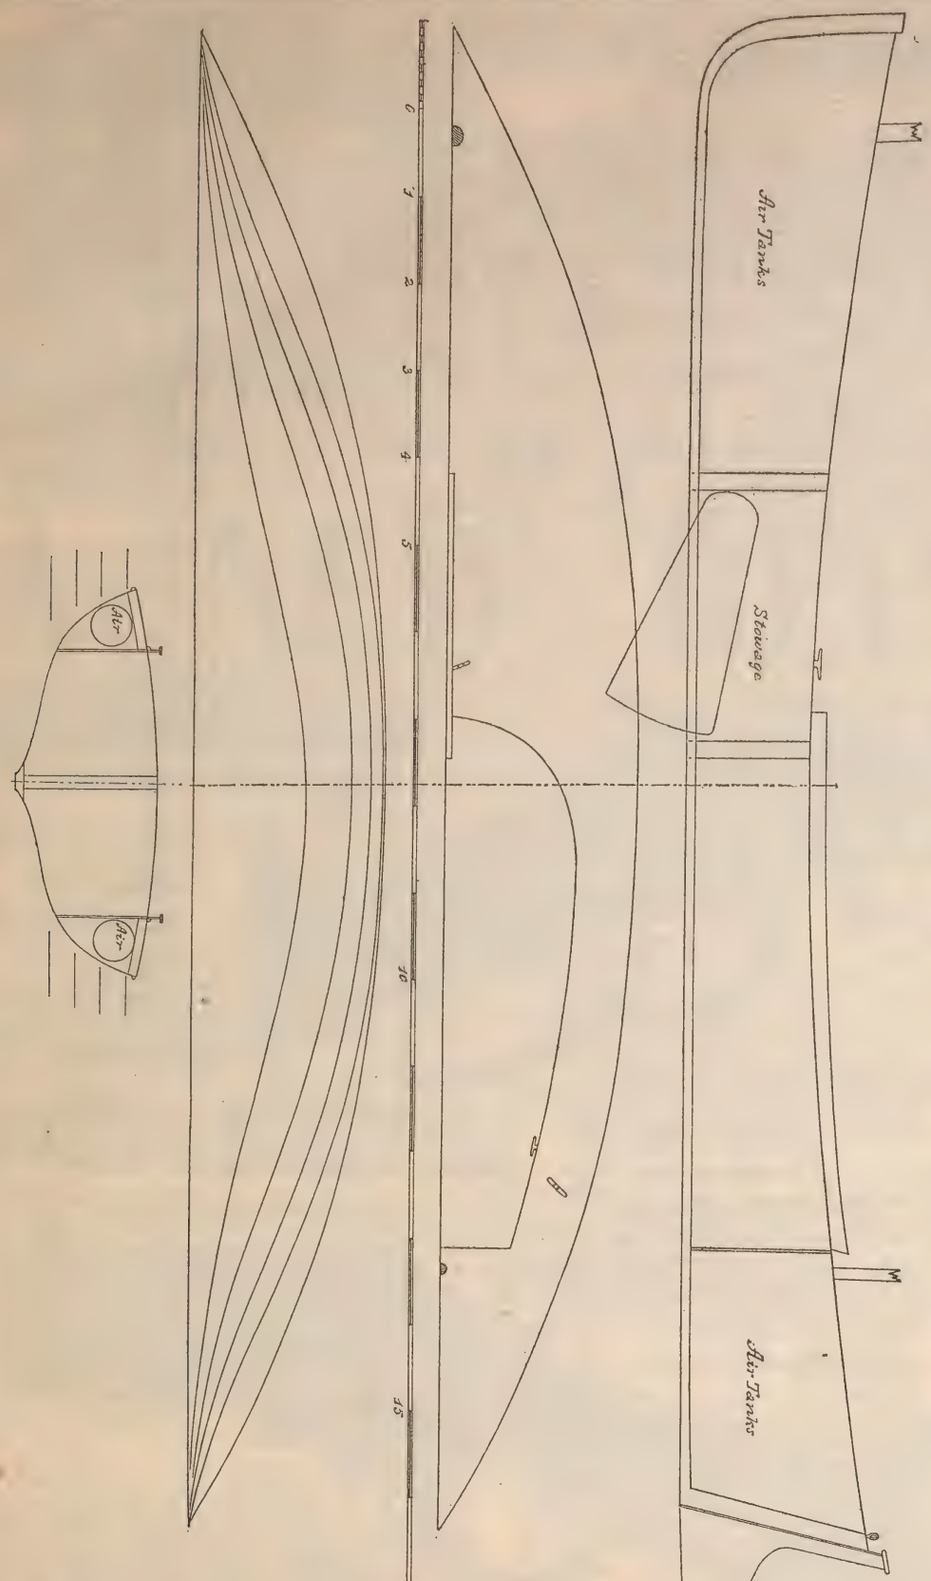
And, lastly, cruising is not racing, impress on all cruisers the importance of keeping together. Keep within hailing distance all the time, tack together, and when you find yourself ahead slack off the sheets and wait for the others. The progress of a fleet should never be faster than its slowest boat. An upset amounts to nothing when help is near, but when a quarter or a half an hour elapses before a rescue it opens too widely the portals of eternity.

MOHICAN C. C.

THE Mohican C. C. held their second meeting in 1887 at the house of the very active Turtles, Will and Phil Wack, around the new canoe, built for their captain, R. S. Oliver, by Charles Piepenbrink and J. Herrick, of Albany; Piep. may be recollected by many canoedlers who attended the A. C. A. meet last summer. He is on the high road to rival friend Rushton as a builder.

Oliver's new canoe is a beauty in looks and lines; what she will be able to do on the water later reports will tell, when the ice has left us.

The new secretary, who has acted as such since last summer, when Fernow resigned, has not told canoedom of the flourishing condition in which the Mohicans found themselves at their annual meeting in January. Thirty-three members with twenty-one canoes in commission and a goodly sum of money in bank. The officers for this year are the same as last year: Captain, R. S. Oliver; Mate, H. R. Pierson, Jr.; Secretary-Purser, W. H. Brown.



The business transacted at the last meeting was slight. Correspondence from outside was looked over and answers decided by vote. Fernow resigned from the club because he is opposed to "deadwood" in a flourishing organization like the Mohicans and is obliged to consider himself as such on account of his illness. He was elected "honorary Turtle" and voted the thanks of the club for past services.

J. Herrick, already mentioned, had sent to the meeting a new centerboard model contrived by him. Clever in a way, but your correspondent fails to see its claimed superiority over the Atwood and Radix.

Bushton had sent a 60ft. sail of his new pattern, which was displayed half reefed in Oliver's new boat. It looks nice, but may be liable to bag very much. The FOREST AND STREAM contained a description of it a few weeks ago. A PAIR OF SHOES.

A. C. A. MEMBERS.—The following names have been sent to the secretary for admission as active members to the A. C. A.: George Bullock, Cincinnati, O.; Harry Inman, Amsterdam, N. Y.; Jas. F. Latham, Chicago, Ill.; Eldridge W. Graves, Dubuque, Ia.; R. C. Brown, Troy, N. Y.

OBITUARY.—Mr. Frederick Good, known to our readers by his nom de plume "Ægir," died last month at Hull, Eng., where he was the Danish Consul. Mr. Good was the author of the sketch "Lumber Canoeing," in our Christmas number, and of "A Winter Reverie," published a year ago.

CENTERBOARD CANOE YAWL "ANNIE."

A CENTERBOARD CANOE YAWL.

MOST of our readers are familiar with the Mersey canoe yawls such as Vital Spark, Tomboy, Viper and others described at times in our columns, all keel boats. The boat shown in the accompanying plans is a modification of the other boats to the needs of shoal water sailors and also to those who wish to house their boats when not in use. Her leading dimensions are: length 18ft., beam 5ft. The drawings show a slightly smaller boat, but a scale was used in building which brought the beam up to 5ft. The Annie was built at Oswego, N. Y., for Mr. Geo. N. Burt, by Joseph Henley, who made the model from the owner's instructions. She has been used on Lake Ontario with great success, proving fast as well as safe and comfortable for pleasure sailing. As the hull is light it can readily be hauled in or out of the house by one man, quite a consideration in some localities. The Annie is planked with 7-16in. cedar and white pine in alternate streaks, the timbers being ⅞×⅛in., spaced 4in. The deck is of cedar, on chestnut carlins 1×1¼in., spaced 6in. The cockpit is 7ft. 2in. long and 3ft. 5in. wide, with a 3in. coaming of butternut. The centerboard trunk is 8ft. long and the board is of boiler plate, 26lbs. The total weight of hull is 500lbs. The ballast consists of six bricks of lead, 25lbs. each, stowed in the space abreast the trunk, besides which two bags of sand, 50lbs. each, are carried in the well. The lead bricks are covered with canvas and have rope handles, so they are quickly carried in or out. The spaces in each end are filled with air tanks, one being placed also on each side of the well as shown. No oars are used, a paddle being carried for calm weather, but the boat is expected to sail whenever there is any wind. She is rigged with a boom and gaff mainsail and a sprit mizen. The mainmast is 17ft. heel to head, and 3in. diameter; main boom 12ft., gaff 5ft. 4in., mizen mast 11ft., and 2¼in. diameter boom 5ft. The hoist of mainsail is 12ft. 4in., and of mizen 8ft. The main gaff has peak and throat halliards, the former with double block on mast and single on gaff. Both halliards lead through fairleaders on deck to the after end of trunk, where they belay. The rudder is fitted with long steering lines. There are no fixed thwarts, but movable seats are used. A spinaker is carried on the mainmast, the boom being jointed for stowage. She has been through some bad weather on Lake Ontario, proving herself a fine roughwater boat, riding lightly and going well to windward in rough water. In ordinary sailing she is very fast, and with two or three persons aboard carries her sail easily.

CANOES VS. SAILING BOATS.—*Editor Forest and Stream* I regret to see that your correspondent, "Perch," greatly misapprehends a remark of mine, used when discussing a question of measurement, viz.: that the wider boats "have nothing in common with canoes," and uses it as a text from which he preaches me and, as he supposes, a majority of canoeists into a position of antagonism to the world of jolly cruisers using another type of craft. Now, Mr. Editor, this seems too bad. Your yachting columns last week very ably show the necessity of fixed classification for all large boats, and in my correspondence with Mr. Clapham all I have tried to insist on is this very point of the necessity of classification for racing and the impossibility of racing boats together on an equal basis when of widely different types. This is all my remark can be made to mean, and from a long and wide experience I doubt if any canoeist, or body of them, can possibly have justified "Perch's" assumption that we have "nothing in common" with any one who is worthy to be classed as a lover of nature as she shows herself to those who seek her on the water, whether in birch canoes or steel yachts. I invite your correspondent to know us before condemning and believe he would change his opinion.—GUENN.

BROOKLYN C. C.—At the annual meeting of the Brooklyn C. C. officers were elected for 1887 as follows: J. F. Newman, Commodore; Geo. N. Messiter, Vice-Commodore; Morton V. Brokaw, Purser; John Johnson, Measurer. A regatta is being arranged for Saturday, June 18, and cruises for every month in the season.

THE EASTERN DIVISION MEET.—A meet of the Eastern Division A. C. A. will be held for three days, May 28, 29 and 30, at East Haddam Island, 32 miles below Hartford, and 12 miles above Saybrook on the Connecticut River.

ALLEGHENY RIVER.—A correspondent who intends to cruise down the Allegheny River next June wishes to learn something about the stream, camping places, fishing grounds etc.

Yachting.

Address all communications to the Forest and Stream Pub. Co.

MR. FORBES'S STEAM YACHT.

THE Atlantic Works, of East Boston, have commenced on the steel steamer designed by Mr. Edward Burgess for Mr. John M. Forbes, not for the owner of the Puritan, as generally reported. The dimensions are: Length over all, 120ft.; l.w.l., 108ft.; beam, 18ft.; draft, 6ft. 6in.; freeboard, 3ft. 6in. The general specifications are as follows:

Bar keel of No. 1 rolled iron, in not more than two lengths, scarfs 12ft. long, size 5¾x½. Sternpost and rudderpost of rolled iron 5¾x2½in., with suitable eye and hub for stern pipe, lug forged on rudder top. Stem of rolled iron, 5¾x1½, to extend 5in. above rails, rabbeted to 2ft. below w.l. Frames spaced 21in. centers of angle iron, 2½x2¼x5-16; under engine, 2½x2¼x⅜; at bulkheads, double. Floors one piece of steel 13in. deep, ¼in. thick, and increased to 5-16in. thick under engine; to have 2½in. limber holes in each floor. Reverse bars of angle iron, 2x2x¼in., to line of cabin floors and in engine room to stringers; keelson on top floors 7¼x5⁄16in. plate, with 3x2½ x5-16in. angles. Plating run in fair lines, in and out strakes, of mild steal; garboard and sheer strakes 5-16in., remainder 3 B. W. G. thick; sheer strake to form bulwarks. Butts 7in. wide, lining pieces, spaces between outer plating and frames to have solid filling pieces in one length. Stringers on beams of steel, 3 B. W. G., 16in. wide, tapering to 12in. at the ends, connected with sheer strake with 5x5½in. channel iron. At break of deck on beams, stringers 16in. wide. At break in continuation of main deck stringers of angle iron, 6x3x⅜in., rivetted to clips on frames and to attach to bulkheads.

Deck beams on every frame, of angle iron 4x3x3-16in., with bracket ends 10in. deep. Beams forward and aft of half length, reduced in size. Thwartship bulkheads of iron 3-16in thick, with angle iron at top at fore and after ends of after cabin. Side lights as determined by inspector, eight on each side, 10in. drain. Rail of oak, 6x2¼in., hook scarfed and fastened to angle iron on top of sheer strake. At after cabin to be worked so as to show same as rail from outside. Sheer moulding 1½in., half round iron. Tie plates to run fore and aft at each side of hatches, steel, 6x¼in., riveted to deck beams with countersunk rivets; butts closely fitted and double rivetted; two stringers on each side of 3½x2½x5-16in. angle iron, rivetted back to back. Breast hook on the deck stringer and also at loadline of ¼in. steel plate, fastened to reverse bars by 2x2x¼in. wrought iron, extending over three frames. A collision bulkhead forward of 3-16in. steel. One water-tight bulkhead aft at foreward end of stern tube of 3-16in. steel, and bulkheads at aft end and after cabin. Engine and boiler room bulkheads 3-16in. steel, stiffened with angle iron 2½x2x¼in., spaced 30in. apart. Coal bunkers of 3-16in. steel. with T or angle irons arranged as per plan. Stem, sternpost and keel double rivetted, butt straps double rivetted, other rivetting single. Size of rivets, ⅝in., spaced on plating from 2⅛ to 2¾in.; spacing on frames, reverse frames and floors, 4⅜in.; bulkhead, ½in. rivet, 2in. apart; butt covers 6½in. wide for ¼in. and 8in. wide for 5-16in.

Rudder to draw in at head 2⅞, at heel 1⅞; wrought iron frame, plated with 3-16in. steel; width of rudder, 36in.; rudder stock to have quadrant fitted to top. A wrought iron pipe of 3-16in. steel to be flanged to counter and plate on deck. Bottom to be covered with good Portland cement carried up on the bilge. Deck to be of white pine, 2½in. thick, in long lengths, fastened with screw bolts having heads let in and plugged, or fastened from below. All iron work of deck where covered with wood to be well painted. Ceiling of white pine, ¾in. thick at forward and aft cabin and at forecastle. Cabins to have double ceiling, inside to be ½in. thick, of white pine. Floors of cabin of white pine tongued and grooved 1¼. Beams for cabin and forecastle floors of white pine 3×3½ on 3×3×5-16in. angles. Seams to be run with white lead.

Cabin finished in white pine above top line of top of sofa. Doors, sideboard, sofa fronts, outside of pilot house, skylights and companionways of mahogany. Top of pilot house of white pine and inside of pilot house white pine. Top of pilot house covered with canvas and painted. Main rail from pilot house aft fitted with brass rails and stanchions. Wheel 48in. in diameter. Mahogany connections to rudder fitted complete. Two pairs of galvanized steel davits, with blocks and falls, stepped just inside of rail. Awning stanchions of galvanized iron about 6ft. apart, 5½ft. high over break of deck.

The vessel will be schooner rigged with pole masts.

The engine is an ordinary compound, 12½ and 25×20, with a pressure of 140lbs. The main valves will have Stevenson's link motion and a Meyer cut off. The boiler is similar to the Herreshoff.

The main saloon will be forward, and the sleeping rooms abaft the engine space. The yacht is to be finished by June 11, 1887.

A NEW HERRESHOFF STEAMER.

THE Herreshoff Mfg. Co. have now on the ways in their fine building house at Bristol another steam yacht for Mr. Charles Kellogg, of Athens, Pa., for whom they have already built two smaller boats, both named Lucille. The first of these, a cabin launch, was followed in 1885 by a full decked steam yacht that has cruised for two seasons about the St. Lawrence, and the new boat, named Clara, will be still larger and faster. Her dimensions are:

Length over all	98ft.
Length L.W.L.	92ft.
Beam extreme	13ft.
Draft	5ft.

The construction will be the same as in the Ladoga, Lucille, Stiletto and others of the class; oak keel, steamed oak frame with malleable iron knees, steel diagonal straps across the frames, and double skin and decks. The garboards are of 2½in. oak, but the upper planking has an inner skin of ⅜in. white pine and an outer one of ¾in. yellow pine. The two are fastened to the frames with brass screws, while galvanized screws are used from inside through the inner to the outer skin. The planksheer is supplemented by an additional thick strake of oak about 2ft. below it. The deck is of white pine in two layers each ½in., the boards being 3in. wide and laid in white lead with brass screws. The rail will be of brass. The pilot house and deck fittings are all of mahogany.

The hull is divided by four bulkheads of galvanized iron, all uncut and watertight. The main saloon is 14ft. long and abaft it is the companion and a laboratory. Adjoining the latter is the owner's stateroom, all being finished in mahogany. The forecastle, galley and officers' quarters are forward.

The engine space is 17ft., in which is a triple expansion engine and a Herreshoff boiler. The cylinders are 7½, 12 and 19in. by 10½. The entire frame of the engine is of steel and it weighs complete only 3,100lbs. The working pressure is 225lbs. The propeller, skag and balance rudder are all of composition or bronze, and the shaft is of 3in. steel with a copper casing. The new boat is intended for speed. She will be rigged as a schooner with lug-footed sails.

The firm have also a launch 48x7ft. 4in., a sister to the Henrietta, for a New York owner.

Messrs. Herreshoff furnished a model of a yacht to Mr. William Zeigler, but it is reported that the negotiations are off. This vessel was to be 82ft. over all, 69ft. l.w.l., 19ft. 2in. beam, with 35 tons in her keel.

DILWORTH.—The New Jersey Y. C. has sustained a serious loss in the death of Com. Wm. H. Dilworth, which occurred at his home in Hoboken on Feb. 10. Mr. Dilworth was well known as an ardent Corinthian yachtsman and a leader in his club. He owned the open boat Dare Devil some years, and for two seasons past has been part owner in the sloop Wayward. A meeting of the club was held at their house on Feb. 12 at which it was resolved to attend the funeral in a body, and that a floral design representing the Commodore's pennant of the club be offered. The funeral took place on Feb. 14 from Trinity Church, Hoboken.

SEAWANHAKA C. Y. C.

A SPECIAL meeting of the Seawanhaka C. Y. C. was held on Feb. 14, to ratify the amended sailing rules of the club, and to complete the changes necessary to its incorporation. The importance of the meeting brought out a good attendance, and the many intricate questions which arose as the rules were read and discussed, made it after 1 A. M. before an adjournment was moved. Although the changes have been discussed in committee for several weeks, and have been laid before the members in printed form for their consideration, there are still some doubtful points, and as it is desired to do the work thoroughly and permanently, these points were left for further consideration, the body of the report being adopted as below. As Com. Canfield, who presided, is chairman of the special committee, he called ex-Com. Tompkins to the chair. The proposed rules were read by the commodore, and on his motion the title was changed to Racing Rules instead of Sailing Regulations, as they are intended to govern races only, the ordinary rules of the road continuing of course to govern general sailing. In accordance with this change the Sailing Committee will hereforth be known as the Racing Committee. The first rule was read and passed as printed, but the second, relating to classification, was after discussion amended so the classes for cutters, sloops and yawls are 75ft. and over, 65 and less than 75; 55 and less than 65; 45 and less than 55; 35 and less than 45; 25 and less than 35. The schooner classes were unchanged. To correspond with this change the numbers of the classes were altered whenever they occur in the rules. The article in Rule IX. relating to professional crews was, after much discussion, amended so as to allow professional crews on first class, over 75; second class, 65 to 75; and third class, 55 to 65ft. Rule XII. relating to drafts of lines, was referred to the special committee and the measurer for revision, and will come up for subsequent action. Rule XIII. was amended to read:

Yachts are restricted to the following sails in races:

Schooners—Mainsail, foresail, foresaysail, jib, flying-jib, jibtopsail, fore and main gaff-topsails, main topmaststaysail and spinaker.

Cutters, Sloops and Yawls—Mainsail, mizzen, forestaysail, mizzen staysail, jib, flying-jib, jibtopsail, gafftopsail and spinaker.

All or any of the foregoing sails may be carried as balloon sails, gafftopsails excepted.

Schooners and first, second and sixth class cutters, sloops and yawls, are permitted to carry light sails over working sails at pleasure. A gaftopsail is a jib-headed topsail that does not extend above the truck nor beyond the gaff end.

Rule XVII., abolishing the time limit in all races, was carried after discussion. Rule XX. relating to courses was referred back to the committee, as it is necessary that the starting point in the Narrows be changed, and a movement is now on foot in the New York and Atlantic clubs, in connection with the Seawanhaka, to establish uniform courses in the Bay for all three. Rules XXII. and XXIII. were slightly changed in the wording, but the sense is as before. Rule XXXI. relating to ballast, etc., was changed to read:

(1) Yachts contending in a race shall keep their floors down and bulkheads standing.

(2) No ballast shall be shipped or unshipped during the race or after 9 P. M. of the day previous to the race, and no water shall be started from or taken into the tanks during the race or after 9 P. M. of the day previous to the race.

Rules XXXIV., and XXXV. were finally adopted in the following form, the arrangement being considered more convenient. The substance of some of the rules has been materially altered from the first printed form. Sections 5 and 7 were referred back to the committee for further consideration.

RULE XXXIV.

Right of Way.—When two yachts are sailing on courses that will involve risk of fouling, one of them shall keep out of the way of the other as follows:

Free and Close-hauled. (1) A yacht sailing free shall keep out of the way of a yacht close-hauled.

Port and Starboard Tack. (2) A yacht close-hauled with the wind on port side, shall keep out of the way of a yacht close-hauled with the wind on starboard side.

Free with Wind on Different Sides. (3) When two yachts are sailing free with the wind on different sides, the yacht with the wind on port side shall keep out of the way.

Free with Wind on Same Side. (4) When two yachts are sailing free with the wind on the same side, the windward yacht shall keep out of the way.

Before the Wind. (5) A yacht before the wind shall keep out of the way of any yacht on any other point of sailing.

Overtaking. (6) A yacht overtaking another shall, so long as an overlap exists, keep out of the way of the yacht which she has overtaken.

Tacking to obtain Right of Way. (7) A yacht close-hauled which tacks in close proximity to another yacht must have filled away on her new course before she becomes entitled to the privileges of a yacht on the starboard tack or of a yacht being overtaken.

Converging Close-hauled on Same Tack. (8) When two yachts, both close-hauled on the same tack, are converging, by reason of the leeward yacht holding a better wind, and are in danger of fouling, and neither can claim the right of a yacht being overtaken, then the yacht to the leeward shall keep out of the way.

Converging Before the Wind. (9) When two yachts before the wind, with their booms on opposite sides, are converging, are in danger of fouling, and neither can claim the rights of a yacht being overtaken, then the yacht having her boom on starboard side shall keep out of the way.

Luffing. (10) A yacht may luff as she pleases to prevent another from passing her to windward, providing she begins to luff before an overlap has been established.

Bearing Away. (11) A yacht shall not bear away out of her course to hinder another yacht passing to leeward.

Rounding and Passing Marks. (12) Yachts when rounding or passing marks shall be governed by the foregoing rules, except as hereinafter provided. If an overlap has been established between two yachts, when both of them can fetch by a mark, the outside yacht must give the inside yacht room to pass clear of the mark. A yacht shall not, however, be justified in attempting to establish an overlap, and thus force a passage between another yacht and the mark, after the latter has altered her helm for the purpose of rounding.

Definition of Mark. (13) A mark is any vessel, boat, buoy, or other object used to indicate the course, and does not in the foregoing section involve any question of obstruction to sea room, for which see Section 15.

Definition of Overlap. (14) An overlap is established when of two yachts on the same course, either of them cannot luff or cannot bear away without risk of fouling.

Obstructions to Sea Room. (15) When a yacht is in danger of running aground or of striking a pier, rock, or other obstruction, and cannot go clear by altering her course without fouling another yacht, then the latter shall, on being hailed by the former, at once give room, and in case the latter is forced to tack or bear away to give room, the former shall tack or bear away, as the case may be, at as near the same time as is possible without risk of fouling.

RULE XXXV.

Disqualification. (1) A yacht touching a mark, unless wrongfully compelled to do so by another yacht, shall be disqualified.

(2) Any yacht causing a mark-boat to shift her position to avoid being fouled, shall be disqualified.

(3) If a yacht, in consequence of a violation of any of these rules, shall foul another yacht, or compel another yacht to foul any yacht, mark, or obstruction, or to run aground, she shall be disqualified and shall pay all damages; and any yacht which shall wrongfully cause another yacht to alter her course in order to avoid fouling, or shall, without due cause, compel another yacht to give room, under Section (15) of Rule XXXIV., or shall herself fail to tack or bear away, as required by that section, or shall, in any other way, infringe, or fail to comply with any of these rules, shall be disqualified.

Rule XXXVI. now reads:

(1) Protests must be filed in writing, before 6 o'clock P. M. of the day succeeding the race, with the chairman of the Racing Committee, and must be signed by the owner or his representative.

(2) The Racing Committee may also, without a protest, disqualify any yacht, should it come to their knowledge that she has committed a breach of the rules.

(3) All questions arising in any race, not covered by these rules, shall be decided by the Racing Committee.

(4) The decisions of the Racing Committee shall be final, unless they see fit to refer any question at issue for the decision of the Club.

Rule XXXVII. reads as follows, the portion relating to sailing masters being omitted:

"Should an infringement of these rules be proved against any yacht, she may be disqualified, for such time as the club may see fit, from sailing in club races."

Mr. Wetmore, of the Law Committee, presented a report stating that the articles of incorporation of the Seawanhaka Corinthian Y. C. had been filed, and moved that the present officers of the club be approved as the officers of the new organization, which was carried. The constitution and by-laws were formally adopted, and the old S. C. Y. C. was declared to have ceased to exist. Some minor changes were made to comply with the laws governing corporations, and the date of the May meeting was changed to the first Wednesday in May. The Secretary was instructed to reply to the letter of the Royal Thames Y. C., thanking the club for its courteous action. The Trustees reported the election of one new member, after which the meeting adjourned.

LARCHMONT Y. C.

THE Larchmont Y. C. held its annual meeting on Feb. 9, at the Hotel Brunswick, the following officers being elected: Com., W. S. Alley; Vice-Com., G. C. W. Lowery; Rear Com., Arthur Hunter; Sec'y, Randolph Hurry; Treas., Eugene L. Bushe; Measurer, Frank E. Towle; Trustees—Augustin Monroe, William Murray, Francis M. Scott, Eugene L. Bushe and William S. Alley.

The following amendments to the constitution, by-laws and general regulations were all adopted:

Article 3 of constitution to be amended as follows: Strike out the line "The membership shall be limited to 400," and insert "Sec. 1. The membership, exclusive of life membership, shall be limited to 500." To add as follows: "Sec. 2. Life Membership.—Any member in good standing may become a life member upon the payment of $400, which shall be in lieu of any further annual dues. These payments shall constitute a sinking fund for the redemption of the outstanding bonds of the club. Life membership shall be limited to (50) fifty."

Chapter III. of By-Laws.—The first sentence to be amended, to read as follows: "The yearly dues of each member shall be twenty-five dollars, payable at the annual meeting." Chap. XII., Regattas.—To be amended by adding, "and a fall regatta, to be sailed on the first Saturday in September." Chap. XIII., Prizes.—First line, strike out "regatta" and insert "the fall regattas," also make "regattas" "regatta" in second line. Rules, regulations and conditions relating to the pennant regattas of the club.—First line, strike out "Pennant regattas shall be held in June and September of each year on days," and insert "a pennant regatta shall be held in June of each year on a day." Sailing Rules and Regulations.—Under heading Prizes, add at end as follows: "The owner of every winning yacht in the regattas of the club shall, within 24 hours of the finish of such race, and before the awarding of the prize, file with the regatta committee the names, occupations and addresses of his crew, and his certificate that they are amateurs under the rules of the club. The regatta committee shall not award any prize unless the above provision is complied with." Uniform.—Under heading "Buttons," amend to read as follows: "The club button shall be of black vulcanized rubber for members, and of gilt for the crews, and of two sizes, large and small." Under heading "Designation of Rank," add as follows: "Sailing masters, a fouled anchor 2½in. in length, unbordered in silver on the right sleeve in front and above the elbow. First mate, same as for sailing master, placed on left sleeve and in front above the elbow. Second mate same as first mate, the anchor being embroidered in white silk instead of silver." Uniforms for Sailing Masters and Mates.—Coat: Single-breasted sack coat of navy blue flannel, to button with the large gilt club button. Trousers of navy blue flannel. Waistcoat of navy blue flannel or white duck, to button with the small gilt club button. Cravat of black silk. Cap: Regulation club cap with a small gilt club button on each side. Straw hats, Humit or Mackinaw straw hats, with a black band, may be worn in warm weather for service dress by sailing masters and mates. Uniform of crews.—Shirt of navy blue flannel, with wide navy collar, with the name of their yacht worked in front. Trousers of navy blue flannel. Cap: Round white cap of navy blue cloth, with black ribbon band having the name of the yacht thereon in gilt letters. Jerseys: Blue woolen Jerseys, with the name of the yacht worked in white letters in front may be worn in lieu of the shirt for service dress.

The yearly dues were formerly $20. The fall pennant regatta has been dropped and a regular club regatta has been substituted. The following members were elected:

Addison Cammack, C. P. Buchanan, Jenkins Van Schaick, R. L. Cutting, Jr., S. B. French, H. Victor Newcomb, J. T. Atterbury, D. B. Van Emburgh, J. Rogers Maxwell, E. M. Padelford, W. A. Boyd, J. R. Andrews, Henry H. Anderson, F. S. Rook, J. P. Paulding, E. P. Steers, Dr. J. B. Kinney, D. B. Gilbert, H. W. Bucknall, E. H. Shethar, L. C. Smith, J. Leland Hoppock, H. E. Payson, R. Renwick, William Kenwick, G. H. Mitchell, Thornton Motley, W. Butler Duncan, Jr., A. Wallace Higgins and A. R. Cazauran, of this city; B. F. Carver, Larchmont; L. Z. Leiter, Joseph Leiter, N. K. Fairbanks, Kellogg Fairbanks and John T. Lester, of Chicago.

The bonds of the club issued to cover the purchase of the Carver estate have all been applied for, and the cash in hand now is $7,974.35, an excellent showing financially. The club will hold another oyster boat race this year, and will offer another prize to the most expert boat sailor on the schoolship St. Mary's.

SHAMROCK.

AT Bay Ridge Mr. George F. Mumm is busy with the new yacht for Mr. J. Roger Maxwell, of the Atlantic, New York and Larchmont clubs. Mr. Maxwell having sold the Daphne, previously built by Mumm from her owner's model, to Vice-Commodore G. W. C. Lowery, Larchmont Y. C., is now building for the second class, the new boat being intended primarily for a racer in hopes that Thistle will prove to be in that class. The model has been made by Mr. Maxwell, while in the calculations he has been assisted by Mr. H. C. Wintringham of the Atlantic Y. C. The dimensions are as follows:

Length over all	78ft. 3in.
Length on load waterline	66ft. 9in.
Beam, extreme	20ft.
Beam on load waterline	19ft. 3in.
Draft of water	7ft. 6in.
Least freeboard	2ft. 10in.
Center of buoyancy abaft middle of length of load waterline	2ft. 4½in.
Center of buoyancy below load waterline	2ft. 1in.
Meta center above center of buoyancy	7ft. 1in.
Center of gravity below load waterline	.. 6in.
Meta center height	5ft. 3in.
Mast	52ft. ..
Topmast	43ft. ..
Boom	67ft. 6in.
Gaff	42ft. ..
Masthead	9ft. 6in.
Bowsprit outboard	32ft. ..
Spinaker boom	65ft. ..
Sail area	4,600ft. ..
Midship section displacement	68 tons.
Keel	24 tons.
Length of centerboard	19ft. ..
Drop of board	9ft. ..

The keel is white oak, two logs being used. An improvement has been made over the method employed in the Atlantic, and instead of the two timbers lying side by side for their full length, they will work by each other, thus the end of one will extend some distance aft, taking the sternpost, while the fore end of the other extends forward to the forefoot. The keels of Cinderella and Mayflower were constructed in this manner last year. The frames will be of hackmatack, sided 3in., moulded 6 and 4in. and spaced 16in. The hull will be planked with 2in. yellow pine, with oak wales and garboards. Sawyer will make the sails, and it is proposed to have the Shamrock in sailing trim by May 30.

QUAKER CITY Y. C.—Camden, N. J., Feb. 10.—*Editor Forest and Stream:* The annual meeting of the Quaker City Y. C. was held on Feb. 9, at the rooms of the Wheatly Dramatic Association, in Philadelphia. The following officers were elected: Com., Charles E. Ellis; Vice-Com., Thomas S. Manning; Rear-Com., William H. Mickel; Pres., Dr. William H. Vallette; Sec'y, Samuel B. S. Barth; Corresponding Sec'y, William S. Hoffman; Treasurer, Joseph J. Garbut; Measurer, Thomas G. Wilkins; Fleet Surgeon, Dr. William G. MacConnell. Board of Trustees—Robert P. Thompson, Alfred Box, Samuel A. Wood and Oswald McAllister. Regatta Committee—William J. Thorman, A. F. Bancroft and Chas. L. Wilson. The club afterward adjourned to Rudolph's restaurant, where a banquet was partaken of. The new constitution and by-laws went into effect at this meeting, one of the principal features of which is the changing of the club signal, which hereafter will consist of a white ground with a red Keystone in the center. Three new yachts were enrolled and several new members joined. The finances of the club are in a very prosperous condition, and the outlook for the coming season is bright.—MARLIN.

ANOTHER MODEL FOR A RACER.—Mr. John L. Frisbee, of Boston, has sent to the N. Y. Y. C. a model of a racer of the following dimensions: Length on deck, 87ft., L. W. L., 74ft. 6in.; beam, extreme, 22ft. 6in.; L. W. L., 20ft. 3½in.; draft, 9ft.; freeboard, 3ft. 3½in.; lead keel of 40 tons.

CHANGES OF OWNERSHIP.—Social, schooner, has been sold by Mr. C. W. Lippitt to Mr. Oscar Smith, of New York. Lena, sloop, has been sold to Mr. H. H. Salmon, Jr., of Brooklyn. Lotus, sloop, formerly Oriole, has been sold to Mr. H. Robinson, of Staten Island.

A RACING CLASSIFICATION.

THE Seawanhaka C. Y. C., at the last meeting, followed out partly the suggestion in our issue of last week, making the larger classes 55, 65, 75 and over, but the schooners were unaltered. This is an improvement as far as the club is concerned, but it does not affect the question of a common classification. We hope to see the matter pushed further by the clubs in concert, as suggested in the following letter from the owner of the Puritan. The error he mentions was corrected in Table II., the classes being correctly given there:

Editor Forest and Stream:

I have read with interest your suggestion that the leading yacht clubs should agree upon a uniform classification.

The committees appointed by the N. Y. Y. C. and Eastern Y. C., who arranged the existing classifications, believed that a small number of classes was better than many for the interests of yacht racing, and therefore only arranged to have three classes for schooners, and four for sloops, cutters and yawls.

I believe that the present classification was made in the Seawanhaka, Atlantic and Larchmont clubs before the building of the large sloops, which obliged a new arrangement of the first in the New York and Eastern clubs and made it necessary for the Atlantic and Seawanhaka clubs to make a special class last season in their annual regattas. It ought not to be difficult for one or more delegates, with full powers, from each of the five or six leading clubs to meet and arrange an uniform classification to be adopted by these clubs that would be more satisfactory than the many now used. The clubs having many small boats, such as the Atlantic and Larchmont could have a class for boats measuring under 30ft. and 25ft. and over. Their first class could be the same as the second class in the N. Y. Y. C.; then in case they offered prizes for the larger boats to compete for they could always make a special class or race for the occasion. I hope that something can be done in the matter before the season opens.

J. MALCOLM FORBES.

P.S.—The fourth class in our Eastern Y. C. measures under 40ft. and 30ft: and over, not as given in the FOREST AND STREAM, 35 and 30ft.

BOSTON, Feb. 14.

A WILD TIME IN A YANKEE CATBOAT—Mr. C. P. Kunhard has, single-handed, undertaken and brought to a successful termination a voyage in the Coot a cat (anglice Una) rigged centerboard boat, only 20ft. long on the waterline, from New York to Pamlico Sound, in South Carolina, and back, which for pluck, endurance, spirit of adventure, consummate seamanship, coolness of head and readiness of resource in moments of danger, by which alone he and his clever little boat were brought safely through perilous hazards, from which escape seemed impossible, are probably without a parallel in single-handed sailing. The following extract from the log of the Coot, published in the FOREST AND STREAM, will serve to illustrate the high old times occasionally enjoyed by the solitary voyager: * * * "The actual distance sailed by the Coot was 1,500 miles, the time occupied in accomplishing it nearly eight months. During the whole of this period Mr. Kunhardt lived and slept (excepting two nights) entirely on board his wee barkie, in a tiny cabin some 7ft. 6in. long, its greatest width about the same, and only 4ft. in height." [This is the stuff of which the Anglo-Saxon race is made. What wonder then that it is a conquering race, pervading the world to its uttermost confines, carrying with it its arts, sciences, and civilization, wherever a keel can float, discovery be sought, or adventure encountered, and so it will be in spite of all the effeminate fads of the modern school of sentimental radicalism. 'Tis the nature of the beast—lions are not lambs, nor tigers sucking doves.—Ed. "E. P."]—*Exeter (Eng.) Evening Post, Jan. 19, 1887.*

NOTES FROM BELLEVILLE, ONT.—*Editor Forest and Stream:* The only work that is being done here this season is on a new craft for the second class, which was begun some months ago by ex-Commodore Roy, from a design of his own, but which, owing to his removal to Peterboro, he sold to parties in Montreal, for whom she is being finished. That she will be fast is shown by her fine lines, while she is deeper and a little longer than the famous Iclanthe. Ex-Commodore Roy will be very greatly missed by the club, as he was not only an enthusiast, keeping alive the sport by his sayings and doings, and skilled in the theory and practice of designing, building and sailing his own craft, but a big-hearted, generous and obliging gentleman. Another serious loss to the club is the removal to Toronto some months ago of ex-Vice-Commodore Pike, who was a most valuable member of the club, and who also built and sailed his own yacht. Mr. John Bell, Q. C., is having the Norah rebuilt and remodeled by Capt. Cuthbert in Ratbun's ship yard at Deseronto. She is being lengthened some what, her bows and stern fined down and lead bolted on her keel. Should she sweep the board in the first class this year I shall not be surprised. Your correspondent "Katie Gray" is a little astray as to the match race between the Katie and Emma, which the former won by some two minutes or thereabouts. But it was a good race nevertheless.—PORT TACK.

NEW YORK.—Mr. Norman L. Munro, owner of the launch Henrietta, is now building at Bath, Me., a light draft passenger steamer with feathering paddles for service between New York and the Shrewsbury River.... A steam yacht for extremely shoal water is now building at Greenpoint, N. Y., for Dr. E. P. Huyler, of New York. Her length is 75ft., beam 18ft., and draft of hull, 1ft.; her twin screws, 30in. diameter and 50in. pitch, being fitted to raise and lower. The engines will be 7×7in., with a vertical steel boiler, working 200lbs. The depth of hold will be only 5ft., so the cabins will be entirely on deck. The yacht will be named Edmarth. ....The steam lighter built by Samuel Ayers last fall for San Domingo proved of too great draft, so he has laid the keel for a similar one 50ft. over all, 12ft. beam, and 2ft. 6in. draft. ..Wallin and Gorman have the new Mignonette ready for final painting, and will lay the keel of an 18ft. cruising cabin boat in the shop. They have just completed a nice looking catboat for Mr. S. L. Blood, 17ft. 10in. l.w.l., with a neat little counter stern, partly immersed....Gitana, schr., Com. Wm. F. Weld, has had her jibboom replaced by a single round stick....Two of the thieves who robbed the yachts off City Point, Boston, last year, have received long sentences.

CRUISING NOTES.—Magnolia, steam yacht, is on her way to Indian River from St. Augustine....Lieut. and Mrs. Henn have been for some time on Indian River in the sloop Rambler....Ladoga, steam yacht, left Beaufort, N. C., on Feb. 9, for Charleston. ....Metcor, steam yacht, arrived at Savannah on Feb. 11 bound for Charleston; Vice-Com. Bateman denies that Metcor has been fined $500 as was reported....Ruth, steam yacht, Mr. Swits Condé, Oswego N. Y., was ashore in the inlet off Beaufort on Feb. 10, but came off without damage. The spar buoy on the inlet is reported as out of position....Wanderer, schooner, has refitted at New Bedford and will leave this week for Bermuda, Trinidad and Barbadoes, with her owner, Mr. Geo. W. Weld, and two guests on board. Capt. Ricketson will command her.

THE THISTLE'S PLANS.—In commenting on Mr. Watson's letter to the New York *Herald* published in the FOREST AND STREAM last week (which, by the way, has not yet appeared in the paper to which it was addressed) the Boston *Herald* calls on Mr. Watson again to deny that the alleged plans are those of the Thistle. Mr. Watson has pursued a consistent course throughout in declining, for perfectly obvious reasons, to make any statement. If he is to deny that the Thistle is 80ft. long, then it only remains for some enterprising journals to publish "working plans" of 70ft., 75ft. and 90ft. yachts for Mr. Watson in turn to deny, and the matter is soon settled. Strange to say, Mr. Watson has denied the modest request of the *Herald's* Glasgow correspondent, to be allowed to photograph the yacht in frame.

THE OLD THISTLE.—It is reported that Mr. Zeigler has abandoned his idea of building a new yacht, and will once more build an old one. As, notwithstanding the silver bottom that was put on the Thistle last year, to say nothing of many previous alterations, she has failed to beat anything in the third class, she will now be lengthened to fit the second class, so Bedouin had better look to her laurels.

THE RACE FOR THE CHAMPION PENNANT.—The long deferred race for the champion pennant of America was sailed on Feb. 14. Twelve yachts started over a 16-mile course off Poughkeepsie, and after a close race Mr. Archibald Rogers's Jack Frost won, with Dr. Barron's Northern Light second.

ANSWERS TO CORRESPONDENTS.

W. C. W., New York—There is no strain of black Irish setters.

INQUIRER, Milford, N. H.—We would not advise breeding the bitch to her uncle unless you cannot find a suitable mate of other blood.

EXTRACT from letter received by the U. S. Cartridge Co., Lowell, Mass., from Mr. Frank Hart, of J. Hart & Co., bankers, Doylestown, Pa., dated Jan. 21, 1887: "I have about come to the conclusion that your .22 short rim-fire cartridges are the most reliable in the market, and they are beginning to be appreciated by those who know where a bullet ought to go when they pull the trigger." —*Adv.*

SEND FOR DESCRIPTIVE CIRCULAR.

To Whom It May Concern.

THE MARLIN FIRE ARMS CO.

New Haven, Conn., January 10, 1887.

Some weeks ago we wrote to our customers advising them not to sell Winchester ammunition for .32, .38 and .40-caliber Marlin Rifles, for the reason that the cartridges made by the Winchester Repeating Arms Co. in these sizes were not properly constructed. Under date of December 10th, 1886, the Winchester Co. issued a printed circular to the public, making some remarks to which we deem a reply necessary.

To begin at the beginning: The first Marlin Rifles which we made were .45-caliber, and intended to take the United States Government regulation cartridge. We were soon satisfied that the large primer used in the Government cartridge was not the proper one for a Magazine Rifle, and we induced both the U. M. C. and the Winchester Companies to furnish ammunition for our rifles using small primers. These .45-caliber cartridges are still made in that manner (See page 63 of the Winchester Catalogue, dated October, 1886).

Shortly after this we brought out the .40-60, an entirely new size, ammunition for which was made by both companies, also with a small primer at our request and from our gauges. Some time after that, we called on the Winchester Co. with a model and gauge for the .38-55 cartridge; after examining the model cartridge, and having noticed that it was made with a small primer and flat pointed ball, one of the officers of the Winchester Co., who was present, remarked that we were evidently intending to use this cartridge for a magazine gun. We affirmed that this was our intention, and a further remark by this said officer, saying that this was the proper way to get up a cartridge for that purpose. We introduce this incident to show that the Winchester Co. fully understood the point at issue. The .38-55 cartridge as well as the .32-40, which latter we brought out at the same time, were also made just like the .40-60 and .45-70 had been, *with a small primer.* These cartridges are so advertised in their Catalogue of November, 1885, page 66. A significant fact in this connection is that the .40-60 Winchester cartridge (which was made to compete with our .40-60) was then and is *now* made with a small primer. We claim that ammunition for Repeating Rifles, where the cartridges follow each other consecutively in a tube, should in all cases have SMALL primers to insure perfect safety, as when large primers are used, there is more or less liability, if the weapon be severely jolted, to an explosion of one or more cartridges in the magazine, because the bullet of one cartridge abuts against the primer of the next. If small primers are used, the apex of the bullet will not touch the primer but come against the solid head of the shell, thus insuring perfect safety in that respect. We guarantee the Marlin Rifle to be PERFECTLY SAFE, and therefore insist on small primers as the only proper ones.

In the matter of the Army Trials to which their circular refers, and in which they claim that the Board tested large primers with entirely satisfactory results, the Report of the Board shows that an exhaustive test was made on this point, and that large primer cartridges twice exploded in the magazine, thus proving that our objections to ammunition so made are well taken.

Some months ago we began to get complaints of misfires. These complaints continued to come in from all parts of the country, parties usually claiming that the cause must be some defect in the Arm. We investigated and found in each case ammunition of the Winchester make had been used, and then for the first time we discovered that they had altered the cartridges .32-40, .38-55 and .40-60, and substituted large primers; we also found that the primer pockets had been made nearly 1-32 of an inch too deep, so that the first blow sent the primer deeper into the pocket, and it required another blow to explode it. We were much annoyed, had been put to considerable expense, and as a large amount of the Winchester make of Marlin cartridges were on the market distributed all over the country, it would have been serious for us to allow the matter to go any further. We called twice on the Winchester Co. to have the matter remedied, but received no satisfaction, and when we found, on the issue of their Catalogue of October, 1886, that they did not intend to accede to our request to go back to the original style of Marlin cartridges, which had been made from models and gauges furnished by us, we concluded the only way to protect ourselves and prevent our Arms being condemned and driven out of the market by faulty ammunition, was to take the same course that the Winchester Company claim they had to take with regard to their own arms, and guarantee our rifles only when used with ammunition *properly constructed.*

We do not question the ability of the Winchester Co. to make good ammunition, as we have had abundant proof that they can do so, but what we claim, is, that this particular ammunition is not properly made for the purpose it is intended for. We are not makers of ammunition, and it is for our interest that any and all makes of cartridges can be used in our Arms. If the Winchester Co. will see fit to go back to first principles, we shall take pleasure in advising the use of their cartridges for Marlin Rifles equally with those of other manufacturers.

One other point: In the Winchester Circular a fling is made at the quality of our Arms. The best comment to be offered upon this point is, that, with the prices of our Rifles about 20 per cent. higher than the Winchester, the sale during 1886 has INCREASED 35 PER CENT. over any previous year, and we have never been obliged to meet their prices to do all the trade our facilities would permit.

We do not like controversies, and regret the necessity of this circular; but we desire to have the matter put in its true light, and to keep our goods properly and favorably before the public.

Respectfully yours,

The Marlin Fire Arms Co.

A WORD IN SEASON.

Readers old and new of the FOREST AND STREAM may be pleased to know that the paper is now at the close of 1886 enjoying the support of a wider circle of friends than at any former period in its history. This is an interesting fact, for it proves, with the best possible demonstration of success, the sound sense of the theory long ago adopted by editors and publishers, and steadfastly adhered to, that there is room in this country for a journal treating the subjects embraced by our departments, and depending for its support wholly upon what have been accepted by the conductors of the FOREST AND STREAM as legitimate journalistic methods. In other words, we have kept faith with subscribers by devoting our reading columns exclusively to honest reading matter, and have not given up our pages to extended paid puffs of railroad routes clumsily disguised as accounts of sportsmen's travel, nor alluring descriptions of wonderful agricultural regions, all paid by the column. The conviction that a sportsman's journal for sportsmen could be conducted without resorting to such questionable makeshift expedients have proved quite correct.

The tone and high character of the journal, as one fit for sportsmen to receive into their homes, will be jealously maintained. As there is nothing in the recreations of field and stream inconsistent with the highest type of manhood, so, the editors are convinced, there should be in a journal like the FOREST AND STREAM nothing to offend good taste.

The FOREST AND STREAM will be, in the future as in the past, thoroughly representative of the best field sportsmanship of America. It will maintain its position as the chosen exponent of those who seek recreation with gun or rod, rifle, canoe or yacht. Its character will be scrupulously preserved, and readers in 1887 may expect a rich fund of sporting sketches and stories, suggestions, bright sayings, prompt, reliable news, and interesting discussions. Angler, shooter, dog breeder, canoeist and yachtsman, may be assured that whatever is of interest in these respective fields in 1887 will find its way into the columns of the FOREST AND STREAM.

The Sportsman Tourist

columns are filled with bright sketches of travel, camp life and adventure, the reflected experience of a host of outers.

Natural History.

Papers descriptive of bird life, chapters of animal biography, notes on the ways of field, forest and water creatures as observed by sportmen, anglers and naturalists, make up these pages. The special work of the past year has been the establishment of the Audubon Society for the Protection of Birds, begun in February, and having now a membership approaching 20,000.

Angling and Shooting.

Time was when a single journal sufficed in this country for adequate discussion of all the heterogenous pastimes and practices dubbed sport. That time has long since passed away Some of the sports have been outgrown or put under a ban, others have developed to such a degree that each class requires a special organ. The particular fields chosen by the FOREST AND STREAM are those of angling and shooting. The pages given up to these topics are rich with the freshest, brightest, most wholesome, entertaining and valuable open air literature of the day. They have the sunlight and woodsy odor of the haunts of game and fish; they picture nature as seen by sportsman and angler. One has not long to read the FOREST AND STREAM before learning its attitude with respect to game and fish protection. The editors believe in conserving, by all legitimate methods, the game of fields and woods, and the fish of brook, river and lake, not for the exclusive benefit of any class or classes, but for the public. They are earnest, consistent and determined advocates of strict protection in the legal close season, and in restricting the taking of game both as to season and methods, so that the benefits of these natural resources may be evenly distributed.

The Kennel.

This department has kept even pace with the growth of the interest of breeding field and pet dogs. Reports of trials and shows are usually given in the FOREST AND STREAM in advance of other publications, and being prepared by competent writers their intelligent criticisms are of practical utility. This journal is not hampered by personal animosities. It has no judges to "kill." It does not decide a dog's merit by asking who the owner is. It treats all kennel subjects without fear, favor or ulterior motives, and in consequence enjoys a degree of public confidence and esteem denied to such as stagger beneath the incubus of malice and flounder in the bogs of ignorance.

Rifle and Trap Shooting

records scores of meetings and matches, discussions of topics pertaining to the butt, gallery and trap. Secretaries of gun and rifle clubs are invited to send their scores for publication.

Canoeing.

This country is a land of magnificent water courses, and Americans are just beginning to appreciate the canoe as a means of enjoying the delectable charms of river and lake, and bay and canal. The men who are making fortunes by making canoes know best how rapidly the ranks of canoeists are multiplying. Novices and old hands will find in the FOREST AND STREAM canoeing columns, in charge of a practical canoeist, accounts of cruises, lines of new craft, and hints and helps and suggestions without number. Closely allied is

Yachting,

in which the FOREST AND STREAM is the only competent, all-the-year-round, intelligent exponent. Our reports of races are full, prompt and accurate. The numerous illustrations of lines of new yachts make an invaluable record of the development of yacht building.

Weekly, $4 per year; $2 for six months.

ANSWERS TO CORRESPONDENTS.

THE BEN HILL—LILLIAN HEAT.

THE announcement in another column of the result of the meeting of the Executive Committee of the National Field Trials Club is full of significance. This meeting passed sentence on Stephenson and on Bevan, and took action looking toward the dissolution of the old National Club. A new club was organized under the name of the American Field Trial Club.

The verdict passed on Stephenson and Bevan will seem to many severe, but must be regarded by all who have the best interests of field trials at heart as eminently just. An offense of the most serious character was committed by these two men, and it was fitting that they should be punished. While we cannot but feel sorry for them, we must applaud the wisdom of those who passed sentence on them. If Whitford's jockeying tricks had been dealt with in a similar manner in 1880, Stephenson and Bevan might not now occupy the position which they do. It has been the fashion for the authorities in canine matters to overlook offenses—to pass them by because the perpetrator was a "good fellow." The result of this easy good nature is seen in the commission, at frequent intervals, of all sorts of violations of rules and regulations, of frauds like the Sans Souci matter at Philadelphia, and the pulling of Ben Hill. It is high time that an end was put to all this business, and it is a good thing that men have been found with pluck enough to look at things from the standpoint of justice merely.

A spade is a spade whether it be in the hands of a friend or an enemy. In matters of public interest things must be called by their proper names. Stephenson has no one to blame but himself. He seems to have gone into this matter with his eyes open, to have made no secret of what he was doing. Bevans's case is a harder one. He is an Englishman, not long in this country, presumably unfamiliar with our ways, and was acting under orders. To him a year's suspension is a serious matter. While we are heartily sorry for these two men, we cannot regret the action of the committee. Dog jockeys will remember their action, and tricksters will govern themselves accordingly at subsequent trials. Sharp practices will not be so popular in the future as they have been in the past.

General Shattuc and his associates have shown themselves men of pluck and courage. Let them root out all the rottenness that they find, and the honest men in the dog world will heartily applaud and sustain them.

Comment on the action of the committee looking toward the dissolution of the National Field Trials Club may be suspended until a full report of the meeting is received by mail.

WILD CELERY.

THE reports from a Syracuse correspondent relating his success in growing wild celery in wildfowl waters are encouraging. The introduction of wild rice to waters where it was not indigenous has, in many cases, furnished an attraction for wild ducks and provided excellent shooting. If wild celery can be successfully grown, as in the case narrated, the shooting on old grounds may be, by this means, vastly improved and new ones provided. Now that the cultivation of wild celery has been tested and proved practicable, it only remains for clubs, associations and individuals to take up the work and add to their annual wild duck supply. This is not an expedient that need be left to organized clubs who control shooting grounds. The wildfowl shooters of any locality might join in the scheme of stocking their grounds with wild celery, the benefits from the enterprise to be shared by all.

Mr. Cross, to whom our correspondent alludes as the one who secured celery seed for him, might perhaps be willing to assist others in the same manner, for we know him to be most obliging; but it is quite possible that the attention necessary to be given to the subject in compliance with repeated demands, might be too great a tax upon his time. If some one on the Chesapeake Bay or elsewhere, where wild celery abounds, would undertake to supply the seed and bulbs, he might find enough profit in it to pay for the labor.

A writer in *The Epoch*, noting the diminishing canvasback duck supply, suggests that by feeding domestic ducks and other poultry on wild celery they can be made to equal the wild duck in gastronomic qualities. That may do for the *bon vivants* and gourmets of city restaurants, but no cunning device of poulterers nor alchemy of modern science can impart to barnyard fowl the distinct and peculiar flavor which attaches to a wild duck which a man has traveled five hundred miles and lain cramped in a battery eight hours to shoot.

THE NEW YORK LAW.

THE New York Association for the Protection of Fish and Game, the Eastern New York Fish and Game Protective Association, the Anglers' Association of the St. Lawrence River, the Fulton Fish Mongers' Association and the Marketmen's and Game Dealers' Protective Association have, after a number of conferences, prepared and forwarded to Albany the draft of a new game bill. For an authorized copy of the document we are indebted to the courtesy of Hon. R. B. Roosevelt, president of the first named society. A summary of the provisions is given on page 87. It has been announced that the bill was to be a codification of existing laws, with such amendments as the conferring parties might deem expedient. As a codification the document is clumsy, carelessly drawn, disconnected, involved and on certain points obscure. Some of the amendments, whether wise or unwise, have at least the merit of pleasing the particular classes for whose special benefit they are presumably intended. Thus (Sec. 1) the month of May is made an open season for deer, this no doubt as a concession to city anglers who visit the North Woods at that time and want their trout and venison together all in the merry month of May. To suit these same Adirondack frequenters the ruffed grouse season up there is made to open a month earlier than elsewhere (Sec. 2). July woodcock shooting is allowed (Sec. 2) as a concession to the dealers: and it will also open the hotel kitchen backdoors for chicken partridges to be placed as a sweet morsel on the plates of guests who know a good thing when they can get it in July. Protection is removed from bobolinks, warblers and numerous other small birds as a concession to the gourmet who wants to line his "fair round belly" with reed birds, and to the milliners who want song bird feathers for hat decoration.

The seasons for sale of game are materially lengthened (Sec. 6), and with the times as here prescribed it is understood that dealers will be satisfied and will aid in enforcing the law. This last consideration is important because the bill (Sec. 29) repeals the State game protector law and leaves us dependent upon the pleasure of those who, as they choose, may or may not observe the statute. The privileged midsummer atrocities of hounding wet does into Adirondack lakes and killing them there is still retained (Sec. 7) as a concession to the New York brokers and near-sighted old maids who do that sort of thing. The "absolutely necessary" phrase in Sec. 15 is an all-embracing concession to the corporations who are polluting our rivers and bays with their deadly refuse.

There are numerous other points on which comment would now be premature, for what the bill is now and what it may be, after all the other interested classes have harangued the game law committee into "codifying" for their special benefit, is a mystery which only time will reveal.

QUAIL FOR EUROPE.

ONE of the noteworthy branches of activity in fostering a game and fish supply is the transplanting of various species from one country to another. Australia and New Zealand have been stocked with trout and salmon from Europe; America has received new food fishes from the same source, and given others in exchange. The introduction of foreign game birds has been undertaken on a growing scale in this country. Now, American "Bob White" is to sound his whistle in Sweden. Mr. James Frederic Dicksen, of Gothenburg, Sweden, has commissioned his friend, Hon. W. W. Thomas, Jr., of Portland, Me., late United States Minister to Sweden, to procure for him a supply of American quail, which Mr. Dicksen proposes to put out on his shooting preserves on the peninsula of Onsala. The birds will probably thrive there. The preserves, many thousand acres in extent, comprise cultivated fields, interspersed with rocky knolls covered with scrub, trees, bushes and heather. The thermometer in winter rarely goes below +15° Fahr., and the light snows melt off in a few days. The European partridge abounds and thrives there.

Mr. Dicksen's experiment will be watched with interest, and we hope in time to chronicle its complete success.

"JACK DARLING'S LITTLE CASE."

OUR readers may remember that the suit brought by Jonathan Darling, in June last, against the American Express Company for failure to deliver certain deer and caribou skins, horns, etc., which were seized at Bangor, Me., by Game Warden Allen, resulted in favor of the express company, and that Darling appealed from the finding of the Court. The appealed case came up for hearing in the Superior Court for Suffolk county, on February 8, current, before Barker, J. The parties were represented by the same counsel as on the former trial, Messrs. Reed & Curtis for Darling and Louis D. Brandis, Esq., of the firm of Warren & Brandis, for the express company. Substantially the same story was told by Darling as before—that on March 17, 1886, he had brought to the company's agent at Olamon, Me., a shoe box nailed up tightly and containing beaver, fox and muskrat skins, two deer's heads, with skins, etc., for mounting, and two caribou heads with horns and neck skins; that the agent marked the box and received and receipted for pay for forwarding it; that the box, when delivered in Boston, looked as if it had been renailed, and the deer and caribou skins were missing. Mr. Edward Kakas, the consignee of the articles, told the same story as to the box. Darling had never seen any notice by the American Express Company refusing to carry deer hides, etc., though he identified on cross-examination some newspaper articles, etc., which showed his knowledge of such a regulation. In his opinion, deer and caribou skins were "fur," a point, however, in which he differed from Mr. Kakas and the defendants' witnesses. The only point upon which his memory had been refreshed was as to the conversation with the express agent when this box was delivered. The express receipt reads, "a box said to contain furs." The agent testified that Darling told him it contained "furs" and that he would have refused to accept the box if he had not so understood it, and that Darling knew he would refuse. Darling's subsequent recollection is that the agent said, "I suppose these are furs?" and he answered "yes." This, he claims, was not a fraud upon the express company, whether the other was or not.

The defense contended that, as the contract was pro-

cured by the fraud of the plaintiff, they were not liable; that as the company had forbidden their agents to accept these goods and as the plaintiff knew of it, the agent had no authority to bind the company; that the seizure of the goods at Bangor was by lawful authority which the company was not called upon to resist, and that failure so to resist was not the "fraud or gross negligence" for which alone the defendants were to be liable under the special contract of the express receipt. Upon the first two grounds the Court found in favor of the defendants, and Darling has decided not to carry the matter any further. From all which it appears that if you want to test the validity of an express regulation you must begin in some other way than by deceiving their agents into violating it.

SNAP SHOTS.

HOW old must a man be to lose interest and pleasure in the field? The Canadian correspondent who wrote last week of "Seafowl Shooting at Berwick" tells us that though now seventy-six years of age and no longer equal to the exertion of ranging the woods in pursuit of game he can still take his place at the trap and make fair scores at glass balls and other targets. And there is President Grévy, of France, eighty years of age, who makes good bags in his holiday shoots at Marly, and who, his friends think, could successfully compete for a prize at a pigeon shooting.

"The Turkey Shoot at Hamner's," which is a sequel to the first (not last) part of "Sam Lovel's Thanksgiving," is in hand and will be given in an early number. We take the liberty of printing this appreciative mention of the series, contained in a letter from Dr. J. H. Baxter, Chief Medical Purveyor, U. S. A., Washington: "I am deputed by Senator Platt, of Connecticut; Senator Fry, of Maine; Hon. Wm. Steward, M. C., of Vermont, and many other friends, who come weekly to my house to listen to the reading of "Sam Lovel" and "Uncle Lisha," to thank you for resuming the publication of these sketches. For beauty of description and perfectness of dialect we have never seen their equal, and we beg that you will continue their publication."

The generous extracts which we take from the recent reports of army officers detailed to the various militia camps, together with a similar article about a year ago in our columns, will give the reader a very good idea of what the arming of the uniformed militia of the country really amounts to. The exhibit is not altogether a pleasing one. There are but few States provided with a decent arm, and fewer still making anything like a proper use of them. The authorities cannot hide behind the bulwark of ignorance of the condition of affairs, for the reports made are full, explicit and reliable.

Major Merrill's paper on the trajectory test, which has been printed in our gun columns, will repay very careful study; it is a valuable exposition of facts relating to the flight of rifle balls. The Major should have credit for his lucid exposition of the laws of projectiles, a subject to which he has given much study, and the literature of which, outside of the text-books, is meagre; indeed it would be difficult to find anywhere a clearer explanation than his own of the trajectory curve with its relation to the line of sight and the axis of the bore.

Among the clubs which have memorialized the House of Representatives, praying for the passage of the National Park Bill, are the following: Nimrod Club, Newark, N. J.; Middlesex County Association for the Protection of Fish and Game, Middletown, Conn.; Bismarck (Dak.) Gun Club; Hudson (Wis.) Rod and Gun Club and Game Protective Association; Poorman's Spring Fishing Club, Harrisburg, Pa.

The account of Mr. Batelle's experiments in ruffed grouse domestication is very instructive, and his paper will rank as a novel and important addition to the literature of wild bird captivity. It is to be hoped that further experiments may be made in the same direction.

Trap-shooting affairs are taking a lively turn. More pigeons are raised for trap-shooting now than ever before in this country; and the consumption of artificial substitutes is assuming enormous proportions.

Subscribers who may chance to receive mutilated or defective copies will confer a favor by returning them to this office, and others will be supplied in exchange.

The ardent gunners who go shooting in close time appear to have a peculiar knack of blowing each other's heads off.

Is it a sign of the times that gun and target manufacturers are publishing testimonials from champion girl shots.

Wild geese flying north honk the coming of spring.

Ohio has a new trap shooter's league.

THE CRUISE OF THE HIRONDELLE.—II.

BY J. M. LE MOINE.

THE yacht was careening over under a stiff westerly breeze; the flood tide had just turned; an experienced old yachtsman, Mac of the Isles, held the helm. The low rocky shores of Seal Rock were fast disappearing as the Hirondelle, close reefed, plowed merrily through the surf in the direction of St. Jean, Port Joly Church. To the north a flock of silvery gulls were disporting themselves in the shallows, while the descending orb of day shed his mild radiance on the leaping waters.

"Pass around the Garcias," sung out the Commodore to the cabin boy, "Let us have a glorious smoke before casting anchor at McPherson's House, Crane Island."

"We have plenty of time before reaching there," replied the Antiquary, "suppose, most illustrious Commodore, you give us one of your jolly hunting stories, an account of the *grande chasse d'automne* you made with the lamented Luc Le Tellier at Sorel."

"Well, gentlemen, be it so, light your cigars and give me your attention.

"The famed hunting resorts," said the Commodore, "about fifty-five miles lower than Montreal, on the St. Lawrence, and one hundred and twenty-five above Quebec, are known to Quebec and Montreal *chasseurs* as the Iles de Sorel. These islands and surroundings are the favorite feeding grounds of the snipe and various kinds of plover, curlew, woodcock and other beach birds, as well as several varieties of ducks, the black or dusky duck, redhead, divers or fall ducks, blue and green-winged teal, in fact all the aquatic birds frequenting the fresh waters of the Province of Quebec. Sorel Islands consist of Ile du Moine, Ile des Barques, Ile à la Pierre, Ile de Grace, Ile du Pads, Ile St. Jean, Ile aux Grues, Ile aux Ours and many others less noted, the Commune de Yamachiche, la Baie Febvre, les Baies de Maskinongé et de Yamachiche, with the miles of reeds which skirt Lake St. Peter on both shores as well as the islands, some of which are covered with soft maples and other deciduous trees, while the others are simply reedy islands, when the water is very low, and at other times completely flooded. On the higher lands, which are commons under the control of the municipalities, the farmers of the vicinity allow their young cattle, horses and hogs to run wild. The latter, being much given to feed upon the bulb of a variety of reeds, root them up, making bare patches, which are capital feeding grounds for snipe. One, however, needs a quick eye to mark a bird down, should he drop into the high reeds or wild hay near by, or the service of a first-class retriever, else one is sure to lose many more birds than are brought to bag.

"On the sandy point of some of these islands, such as the Pointe au Pécaud or Ile au Sable, flocks of golden plover, curlew or beach birds may be often found, and late in the fall numbers of Canada geese on their journey to the south, light and feed in the bays and even in the fields back on the higher lands. When the ice breaks up in the spring, thousands of muskrats are slaughtered by the inhabitants. Some have been known to kill in one season 200, with a simple weapon—an iron spike fastened to a pole—to pry the rodents out of their winter quarters, disturbed by the motion of the ice, lifted from its winter bed by the rush of the waters during spring freshets.

"In October, 1866, I visited the Islands of Sorel, accompanied by Lieut. Montgomery and Ensign Lane of the Rifle Brigade, one of H. M.'s crack regiments, then quartered in the favorite garrison town, Quebec. Last evening, just twenty years later, one of the party, now Lieut.-Col. Lane, on his return from British Columbia to Halifax, where he is now stationed as military secretary to the Commander-in-Chief, Lord Alexander Russell, burst into my sanctum where I was enjoying a quiet smoke, and related to me his sporting adventures, since the capital sport he and I had enjoyed on that memorable occasion when we tramped through the marshes at Sorel, bagging one hundred and fifty snipe in two days to our three guns, and bringing back a champagne basket full of birds. We had listened to the stories of the French Canadian guides, anent the marvelous bags of snipe, woodcock and duck got by the late Colonel Alphonse De Salaberry, Judge Coursol, W. H. Kerr, Harry King, Fred Austin and hosts of others who flocked each season to these islands. Well do I remember the snug quarters on one of these beautifully wooded spots, for many years the favorite hunting box of Judge Coursol and his friends, with its rows of nails all around well under the eaves of the roof, hanging from which could be seen bunches of snipe, woodcock, duck and plover, placed there in the shade and cool air for preservation, and my own cosy quarters in a room of the Ile au Raisin or Ile à la Pierre lighthouse.

"Of the old guides of those days one is still hale and hearty and happy to lead a party to the haunts of game. Maxime Monjeau, of Ile du Moine, although now near his 70th year, covered with silvery locks, can yet handle a paddle and bring down a duck when it comes to his decoys in La Baie du Moine (opposite his little shooting cabin annually set up on the edge of the island, and where he happily passes his days, having handed over to his sons his home, further west on the Ile du Moine). He continues to enjoy the sports to which he is so devotedly attached. Another, poor old Baptiste Martel, of La Baie du Febvre, now fully eighty years of age, still talks and dreams of the day when he tracked the grizzly bear in the Rocky Mountains, where he spent twenty-five years of his earlier life in the employ of the American Fur Company as a *voyageur*. Upon his giving up this occupation, with his hard earned savings, he purchased a home and a few acres of land near his native village, and tried to settle down to the toils of a small farmer's life, but he could never thoroughly do so. He would cheerfully drop the spade or hoe, and conduct the sportsmen from Quebec or Montreal to the woodcock coverts on the uplands, or snipe marshes of the renowned Baie du Febvre. He is now very feeble. I was recently told by a neighbor of his that last summer the poor old man begged his son to drive him to the old duck grounds bordering the lake that he might once more feast his eyes on the beloved haunts of other days. He was carefully seated in a cart well filled with straw, and slowly driven down to the lake shore, which cheered him up wonderfully. He asked his son to stop the horse, and stretching out his withered arm pointed out the many spots so dear to his memory, rapidly relating his exploits with the many gentlemen he had guided over the spot, and the big bags of game they had shot. Feeling weak and tired the poor old *chasseur* completely broke down; in sobbing words he bade farewell to the loved spot, and was conveyed home, as he said, to prepare himself for another world. Poor old Baptiste, how often have I followed him over the coverts and what glorious sporting hours we have spent together!

"Of the other guides of twenty years ago, one was a remarkable character called Charlo Paul, a capital fellow when not given too much spirits. He has now joined the 'great majority' doubtless in better hunting grounds—gathered to his fathers. Charlo did not live to the ripe old age of Maxime or Baptiste, no doubt owing to his love for strong waters to which they were not so much addicted, and evidently live the longer in consequence.

"Twenty years ago among the islands and bays below Sorel, large and varied bags of game could be made. On more than one occasion a brother sportsman and myself have been the fortunate possessors, after three or four days of shooting, of as many as 40 to 50 ducks, 60 to 70 English snipe, and 30 to 40 golden and other plover, and have come home thoroughly revived in health and spirits.

"On one occasion I had the honor of having the lamented Hon. Luc Le Tellier de St. Just, then Lieutenant Governor of the Province of Quebec, as my guest, our quarters being in the lighthouse at the east end of L'Ile à la Pierre. It was during a week's living in one small room with this renowned politician, that one learned to love him as few men have been loved by their own sex. On this occasion our bags of ducks numbered among us, namely: the Governor, his Aid-de-camp, Capt. F. E. Gauthier; his cousin, P. B. Casgrain, MP., and myself, from 40 to 50 ducks per day, and some snipe shot by me. It was on this memorable occasion that the Governor of the Province of Quebec and companions narrowly escaped with their lives. The popular and always obliging Captain Labelle, then in command of the steamer Quebec, plying between Montreal and the city of Quebec, had offered to stop his boat and take us off the island on his way down when we would desire it. We despatched a messenger early one day to Sorel, about seven miles off, to notify him that we would be all ready when he would pass that evening, and to request him to please stop his boat to take us on board. By some means the message was not delivered to Captain Lebelle. We, however, not knowing this, made our preparations, got all our baggage, game, dogs and ourselves with the lighthouse-keeper and one man, in a small boat, very much overloaded, but as we only intended going out a short distance in the shallow water to meet the steamer's boat which we expected would draw too much water to come near the shore, we did not fear any danger from swamping. We saw the steamer about 9 o'clock at night coming full speed, evidently paying no attention to us, when we actively swung a lighted lantern to and fro to draw attention. After the steamer had passed us the captain was evidently informed of our attempts to stop her; knowing the Governor was of the party, he ordered the boat to stop and reverse, the channel being too narrow to turn her. The Governor, with his usual anxiety to give as little trouble as possible when he was personally concerned, insisted upon our attempting to reach the steamer by the man sculling our boat out to her. This, against our advice, was done. The current being very strong, and the huge wheels of the steamer churning the water against it, created a strong eddy, which drew us under the guards of the steamer. Being in the forepart of the boat, I caught hold of one of the paddles of the wheel and with difficulty hung on to its slimy surface. The Governor received a very severe blow on the head from one of the stays which nearly stunned him, and we greatly feared our boat would swamp as it filled with water. One man completely lost his presence of mind and dropped the oar overboard; to the great strength and coolness of the Governor we owed our lives. He called for a ladder. This being let down, we rapidly mounted it just in time to escape from being crushed by the great wheel, which was immediately after set in motion; fortunately the boat containing the lighthouse keeper and our luggage had drifted away from danger, and eventually was propelled ashore. When we reached the cabin, we found we were much bruised but not seriously hurt; our clothing was covered with slime; we presented a sad appearance. Means were taken to give as little publicity as possible to this incident. This was the last shooting expedition of Governor Le Tellier de St. Just. Some months after his health broke down; he soon after died, sincerely regretted by all who intimately knew him. His gun, an excellent 10-bore, was sold by me to Judge G. P. Hawes, of New York, who, I believe, still retains it.

"I fear I have digressed very much from the subject of describing the shooting grounds of Sorel. I can only say that occasionally fine bags of snipe, woodcock and ducks are still made there, but I find that the number of the disciples of the gun, since the past twenty years, have wonderfully increased, as well among the amateur sportsmen who shoot for the pleasure of an outing, as the pot-hunter who slaughters game night and day for the market.

"Snipe are such capricious birds that one can occasionally make as large bags as formerly, but not so often. Woodcock are very much more scarce. As to black or dusky ducks, mallard and wood ducks and teal, the great number destroyed at night on their feeding grounds has been the cause of driving these valuable birds to other and safer quarters. The pot-hunter chooses a favorite spot among the reeds which extend out on the shallows for nearly a mile from shore; with a sickle he cuts off the heads of the reeds, well under water, in a space large enough to make an open water basin of about 30 to 40 yds. diameter. On the edge of this basin he plants a number of trees in front and on each side of his log canoe or dug-out, which he carefully conceals, and then sets out in the most natural order from ten to twelve live ducks fastened by a string, with a soft leather loop to a leg and anchored with a stone or half a brick in about 3ft. of water. These ducks, which are a cross between a wild black duck and an equally black domestic one, make perfect decoys, and call any passing birds to them and to sure destruction.

"On both sides of Lake St. Peter such *cachés* may be found occupied by one or two pot-hunters every three or

four acres apart, right after night, before and after the 1st of September, notwithstanding the game laws being strictly against it. You may well imagine such work has greatly interfered with the pleasures of being quietly paddled through the reeds and getting a true sportsman's shot at a rising bird, for the ducks now shun those dangerous feeding grounds. This, however, only applies to the species of duck visiting the shallow waters near shore. The bluebills and other fall ducks, called by some the divers, still frequent the lake in enormous numbers; in fact I have seen this fall as large flocks as I ever saw on the waters in Florida, where, from their number covering such great space, they are called raft ducks.

"For the lover of shooting, possessed of a good dog for snipe and another for woodcock, and who can spare the time, I know of no more delightful spot to camp on than some of the beautiful islands of Sorel. The scenery is charming; the channels among the many islands most intricate and interesting; the different fresh-water fish, from the maskinongé to the perch, plentiful; and intelligent and reliable guides with canoes may be had at the usual charges. But he who possesses a light draft sail boat, with fair accommodation for a genial companion and self, and who can sail away with his quarters to new spots made bare by the falling of the waters, which often occurs to the extent of from 5 to 8in. in one night, especially if the weather is dry and the wind blows strong from the west, such a one will find snipe, when others on the old ground are wondering if there are any birds left in the country. My experience shows that snipe have a strong liking for new ground, and he who can follow them or take advantage of being on some new, known spot where the waters uncover, is sure to be rewarded for his pains."

ON THE WEST COAST.—I.

IN the winter of 1883 I set out to visit Florida by water on a trip combining business with pleasure. Taking no pleasure in going alone, I hunted up a companion, a Swedish gentleman, who was both sailor and artist. After laying in a goodly store of useful things for a cruise among the keys and along the west coast, we took steamer for Key West about the first of January. On the third day out we passed Carysfort Reef light, the extreme easterly light of the long line of reefs. There are hundreds of these reefs, some inhabited and others roosting places for birds; and varying in size from miles to yards in height by a few hundred yards to feet in width; all are low and most of them timbered. We steamed along the outer or submerged reef, the northern barrier to the deep blue Gulf Stream, carrying thirty fathoms to the coral rock of which the reef is composed. This is surmounted by screw pile lighthouses at intervals of about thirty miles along the whole distance to Key West. Between the lighthouse reef and the keys is a large body of water similar to Long Island Sound, with plenty of depth; north of and between the keys the water is very shoal, excepting two channels, which carry 12 to 14ft. of water, the rest of the thousands of narrow crooked channels have only from 3 to 5ft. We landed in Key West on the third day after a very pleasant trip. The weather was a pleasant contrast to what we had left in New York. We found the flowers blooming, trees in full leaf and the lively little mosquitoes quite frolicsome, the thermometer at 80° and the atmosphere delightful. The town is quite interesting to a Northerner. It has a population of about 10,000; the principal industry is cigar making, out of the wonderful Havana tobacco, although I saw a schooner (the same one I had seen loading in New York) unloading a full load of Western tobacco.

Our first move was to hunt up a yacht and gain information as to channels and water supply; the latter is very necessary to look after, as it seldom rains in midwinter in southern Florida. We found a suitable sloop of about three tons, in good order, into which we soon loaded the supplies, shipped from New York. We purchased a lot of heavy fishing tackle and grains, it being perfectly useless to have any light tackle. Then we shipped a cook and pilot combined in a native. Sail was made and the boat headed in an easterly course. The Bessie made good headway in the light breeze, and the sun was warm enough to render the shade of the sail agreeable. Winding and twisting through the many small channels, whose rocky bottoms are covered with sponge growth, with an occasional clear patch of sand, the water a deep blue; then suddenly running into deeper holes, in which lie silent and dangerous swordfish or man-eating sharks, and having everywhere an abundance of food fish of various kinds in the waters beneath, and in plain sight; all this makes cruising among the keys very interesting to a Northern yachtsman. Many of the small keys passed are entirely under water at high tide, and have a dense growth of mango bushes covering the surface of mud; others have a rocky surface of coral, with stunted growth of timber and elegant limestone soil, which can be only cultivated with hoe and spade, so rocky is the surface. Generally on some portion of the keys that are cultivated are low spots which grow to perfection the Florida mosquitoes; they are immense insects, as we found to our entire satisfaction the first night of the cruise. After passing an eventful day bumping on sand bars (our pilot knew where they were), graining swordfish, sharks and jewfish, and reeling in a few sheepshead, we dropped a tripped anchor off the east end of Sugarloaf Key, to be driven at sunset still further off shore by the mosquitoes that swarmed out to us in clouds. The first night on board is generally an uncomfortable one; the bed is hard and the yacht uneasy. Then the sand flies that came on board.

In the morning we turned out at sunrise, built a smudge in the cabin and had breakfast, consisting of ripe tomatoes, baked sweet potatoes, boiled kingfish with lime juice, hard tack and coffee. After breakfast we pulled ashore in the dinghy, and were met by the only inhabitant, an old man of 60, who lived in a hut entirely built of palmetto, the leaves being used to thatch both sides and roof. We found he had about two acres under cultivation, raising tomatoes, bananas and yams. His greatest difficulty was in protecting them from the small deer that range all over the keys, wading or swimming from key to key. We also found two other varmints that roamed over the keys, and they kept us very much interested in how we moved about on shore; they were the large rattlesnake and the wildcat. The snake was a terror to the key people. The death of one young man was caused by rattlesnake bite shortly before our arrival. As soon as we heard of that lamentable fact we fortified ourselves then and thereafter against snake bite by the usual pleasant remedy. The artist made, as usual, a pen and ink sketch of the native and castle, perhaps he would have made a better looking likeness of the hermit if he had not got a scolding for tramping on his plants; sailorlike, weeds and plants looked alike to him. After hunting here and getting a glimpse of some of the smallest deer I ever saw, but not getting within shooting distance (they were about as tall as sheep and as red as the palmetto they disappeared in), we tripped the anchor and stood on for Little Pine Key, distant fifteen miles dead to windward. We passed several rocky keys, the rendezvous of wreckers, spongers and charcoal burners, the last a tough crowd. Wind hauling to S. E., we kept on and made No Name Key, a spongers' hamlet of four houses, plenty of red wild hogs, fleas, mosquitoes, with small attempt at cultivation.

We gradually discovered the that Bessie drew about one foot too much water and harbored about a million too many mosquitoes. Having a good tent on board, we scribed a line along the outside of our cabin and sawed off the top, leaving height enough to the side for a 10in. combing; then we could get rid of the mosquitoes by raising our tent under the boom, stopped down on deck with a mosquito net in the after end. We were then masters of the situation; and great comfort we had in hearing the gentle buzzing outside. The natives build smudges inside of their houses, driving out everything by smoke; then rushing in they shut up everything and turn in to rest, and they seem to enjoy it.

A sponger's outfit consists of a smart small sloop or schooner with a crew of from three to five men, carrying two or three skiffs with as many long-handled two-pronged rakes, and water glasses (made out of water pails with the wooden bottom knocked out and a glass one in to fit. There is always a big smell aboard caused by the decayed sponges; and the devil-may-care crew, as occasion may require, turn their hands at wrecking some luckless vessel on the outer reef, fishing, or now and then a turn at smuggling from some passing craft from Cuba or Nassau. Fishing for sponges can only be carried on during calm weather. A man, taking a glass and rake, jumps into a skiff and rows off to clean rocky bottom. Taking the glass (or pail) in one hand, with bottom down in the smooth water, he puts his face into the pail, excluding the light as much as possible. This gives him a good view of the bottom where the sponges grow. Using his right hand and shoulder as a lever to the long rake, he secures the marketable sponges that grow fast to the rocks. They are black and glutinous when first caught. Each day's catch, when convenient, is taken to some sheltered place and dumped into a pen or crawl made of sticks stuck upright into the sand under water. If they have not decayed enough they remain a short time and are then trodden out, washed, strung a dozen together, and hung up to dry; afterward limed, washed and then sold at auction at Key West.

The weather being all a yachtsman could desire, plenty of wind, thermometer ranging from 71 to 80°, we made sail for Big Pine Key, wind S. E. and increasing. After coming out from under the land we hove to and tied in a single reef, the clouds threatening a big blow. If there was one thing more than another that our pilot was looking for, it was a "harricane" from the S. E. We concluded he was about right before the end of our cruise in the Bessie. After passing a few small keys we dropped anchor abreast of Mr. Lowe's end of the key, and going ashore found a well cultivated farm of about ten acres. Here were growing tomatoes, yams, bananas and small vegetables, of which we laid in a stock. Weather remaining unsettled we stood on for the southerly end of the key for better harbor, wind piping through the rigging. Heaving to we tied in another reef and ran for the shelter of Summerland Keys, dropped anchor on the edge of a sand bar, the wind still blowing a gale, causing us to drag off into a deep water channel, and the roar of the breakers reaching us over the keys from the outer bar, distant three miles. This channel, Bahia Honda, is the first deep water channel running north and south throug the keys east of Key West, through which vessels carrying 14ft. may pass, going to or from the Gulf of Mexico. Although unlighted it is buoyed out. We found excellent fishing in the channel, and soon had the sport of landing a dozen or more kingfish. To a hungry man, after a hard day's sail, a kingfish boiled in salt water, well buttered and served with lime juice, has no equal. We hove our tent down to the second row of stops, thereby reducing the height 3ft., turned in and dreamed of the dreadful "harricane" that did not reach us this time.

In the morning we found that we were not alone at our anchorage, for during the night wreckers, spongers and fishermen had dropped in until quite a fleet was gathered. A cruising party being such a novelty they became suspicious that we wanted to occupy some of the many fertile keys on which they had squatted. Some of these key gardens have been made the source of considerable revenue by the most thrifty. They raise garden truck for the New York market, sailing into Key West on steamer day and reaching the market in fair condition at an excellent profit. Tomatos in January at $2 per half peck, leave a good margin for the Key Conch as the native inhabitant is called. Our artist, as usual, made sketches of the surroundings. Here we had to dive our anchor loose; it had caught under a rock, our pilot being wise beyond his years in failing to trip it when cast. He didn't mind going overboard several times a day (excepting in sight of a shark) to shove off from a bar or shoal. We shook out the reefs and under full sail and a nice breeze from the westward, stood over for Key Vacas. This is the home of Captain Watkins, who has altered his boat-scraper into a hoe, and has turned farmer to good advantage. In the day's run of about twenty miles we were obliged to keep a man aloft on the gaff most of the time, looking for the channels; twenty miles would represent the distance in an air line. We passed several large turtles lying motionless on the surface. In one of the deep channels we passed over some devilfish or sea bats, and as they scuttled out from under her bottom they made the Bessie pitch and roll as if she were in a seaway. The man aloft having sighted them on the white bottom coming toward us head on, suffered considerable uneasiness as to whether they would go through, over or under us; the channel was narrow and not over five feet deep, and our dinghy towing astern was filled by the commotion, for after running into open water we lay to waiting for the sundry articles lost out of the capsized dinghy to drift along.

DOMESTICATING RUFFED GROUSE.

IF THERE is any game bird that has thus far escaped the domination of man, that bird is the ruffed grouse. Independent, always alert, crafty as a fox and of indomitable spirit, he is a primeval denizen of the wilderness, and cares as little about contact with civilization as the deer or the panther. Other varieties of the grouse and the Virginia quail increase as the settlements widen, but the ruffed grouse moves further and further back, and seeks to shun all contact with the greatest enemy of his race.

It seems to have passed into a tradition, both written and unwritten, that the ruffed grouse is incapable of domestication. Old hunters tell you so when you mention the matter, although not many of them base their belief on actual experience. The books all express the same opinion from Wilson down, and the encyclopedias have reiterated the assertion. Of late days we have become so accustomed to taking this proposition for granted that experiments looking to its correctness have, to say the least, been exceedingly rare. My own investigations in this field have been attended with so much of interest and pleasure, and have resulted so differently from the generally accepted belief that I have jotted down this very unsatisfactory account for the information of your readers. These experiments, I regret to say, by way of preface, cannot be regarded as entirely successful, yet they were so beyond my expectations, and their failure, in so far as they did fail, did not arise from any inherent difficulty but to untoward accidents, which did not affect the main issue.

In the fall of 1884, having successfully reared a fine brood of native quail from a pair of birds confined in the yard, I was seized with the idea of trying a similar experiment with the ruffed grouse. I knew very little about them, and what I could learn was not very encouraging to any attempt looking to their domestication. The task of procuring live birds showed quite conclusively that they were about the most difficult creature abroad to capture, and that the majority of the few which had been "reduced to possession" had been taken by accident. These inquiries also showed that for some unknown reason, nearly all these captive birds were females. In all I succeeded in getting track, during the winter, of but six grouse in confinement, scattered about in different parts of the country, at least two of which were not for sale. But the first week in April, 1885, I secured from a gentleman in Fremont, O., a live bird supposed to be a male, and the same week another from Springfield, Mass., said to be a hen. They were put outdoors on April 23 following in a double or L-shaped coop, built against the house, each part about 4ft.x12ft., with ground floor and wire netting side and top. These coops fronted to the south and west, and as they stood at right angles with each other, they were connected by a small opening about a foot square, which was closed by a swinging door operated from the outside. This gave as much privacy as was possible on a small city lot flanked on two sides by streets.

My principal effort at this time had been directed to the securing of a pair of grouse, but with the single exception of the Ohio bird, all were set down as hens. Being a little fearful that I might not have obtained what I wanted, a commission of experts was appointed, comprising two of the most experienced huntors in town. These gentlemen, having carefully examined my two birds, gave it as their united opinion that the Ohio bird was a male, and the Massachusetts one a female. Thereupon I breathed easier and waited for developments. Perhaps it should be stated just here that the former had been in confinement about a year and the latter about six months, and both appeared to be sound and well.

On the 11th of May my notes record that a place was prepared in the further part of the more secluded coop, for the hen to nest. This was arranged by putting in dry oak leaves about a foot deep and placing over them a number of pieces of brush. The weather for the few days following continued warm and hazy with occasional light rains. Meantime my notes, under date of May 12, say: "The male (Ohio) grouse has for several days manifested the greatest uneasiness, constantly walking back and forth in the front coop. The other bird seems quiet and perfectly contented when not disturbed. Think the male bird's actions indicate the mating fever." (I quote this latter remark as simply going to show how little I knew about the matter.) The diary continues: "May 15.—The first grouse egg was laid to-day, and it seems probable by the alleged male grouse."

May 21 I returned home from a five days' absence, to find that the Ohio grouse had five eggs in her nest. In order to test the matter thoroughly the two birds had been shut up into separate coops, and all the eggs were with the Ohio grouse. What was the most unfortunate feature was the discovery that these eggs, and any that might be laid by the other hen, were necessarily sterile. (I pass by in silence my feeling of disappointment at this most unexpected turn of affairs.) About this time I made what was undoubtedly a hazardous experiment by shutting the laying hen into the other coop. Here she yielded to necessity, made a new nest and went on laying as if she had never been disturbed. The Massachusetts hen showed no signs of laying, but her companion continued laying with occasional intervals of a day, until on the 5th of June, having deposited fifteen eggs in all, she began sitting. Four game bantam eggs were placed under her, and on the 28th of June these were hatched out, the grouse eggs, of course, proving infertile. My experience with these chicks, all four of which the foster mother brought to maturity, has already been given and need not be repeated here. It is worth mentioning that while the Massachusetts hen failed to show any tendency to nest, while the other hen was sitting she became seized with a desire to assist in the incubation, and it finally became necessary to remove her from the coop. Thus ended my first year's attempt at breeding grouse in confinement. Of the second I shall hope to write in another paper.

In the early part of October, '85, I received from the Muskoka country, in Canada, a male ruffed grouse. This bird had wandered into an old barn and been captured

with slight injury, the tip of one wing having been broken. He was placed with the two hens, which by this time had grown quite tame, and seemed to take quite philosophically to confinement, doubtless favorably influenced by the placid demeanor of his two companions. The latter had passed through the summer without mishap, and having moulted in August and September, were in fine condition. The Massachusetts hen was a perfect beauty, and in her deportment "every inch a lady." The three birds being from such widely divergent localities, it was extremely difficult, not to say impossible, to determine their sex by any comparison of the plumage and markings, but after watching them a few weeks, one soon learned to notice a marked difference in their manner and actions. The male bird was bolder and more independent and tamed much more rapidly than the hens had done, although this, I think, partly accounted for by the reason already given. In form the male bird was of a more "stocky" and heavier build than the females, and that would seem to be generally the case. In other respects there was nothing in the demeanor of the male bird toward his companions (except immediately at the breeding season) which served to distinguish the sex—none of the little gallantries and attentions and none of the domineering so marked in most of the males of the Gallinacæ. His disposition at feeding hours, when he promptly appropriated for his own use any little delicacies he could reach first, and his indifference at all ordinary times were in most striking contrast with the behavior of a male Virginia quail of my own rearing in an adjoining coop. Bob White in winter and summer was always pervaded with the consciousness that he was the head of the family and always polite, affectionate and generous in his conduct toward his wife. To see him standing over some little dainty, his back arched and head bent downward and his wings drooping to the ground, while he clucked his cordial invitation to his spouse, was one of the prettiest sights imaginable.

By the middle of the December following all the grouse had grown so tame (the male with the others) that they came readily at call, and fed without hesitation from my hand. It will be understood without saying that from this time they became more than ever a source of entertainment and pleasure. I never came near the coops that they did not appear promptly, no matter where they might be, and though always a little shy of strangers they were a source of constant and marked interest to the many incredulous visitors who were naturally led to revise some opinions of long standing. Meantime the birds went through the winter, which was about an average northern Ohio season, in apparent content, and evidently had adjusted themselves entirely to their new environment.

With the close of the month of March came indications of the advent of spring, although fitful and uncertain as were befitting that month in our latitude. Naturally I was still a little incredulous as to the sex of my Canadian captive after my experience of the previous year, and I began to watch him a little more closely. My notes say that about this time "the Canada bird occasionally has shown a sort of pugnacious impatience when I came near the coops, lowering his head and extending it on a level with his back, striking the ground with his bill, and scratching (or 'pawing') restlessly with his feet." Under date of April 7, I find this note: "Within the past few days the Canada grouse has developed a peculiar marking. The superciliary membrane of the eye has become a bright orange red. The color is so vivid as to be plainly noticeable 30ft. away, and the change is evidently incident to the breeding season. This membrane showed a very faint orange tinge last fall and winter, but not nearly so intense. Neither of the hens show any color above the eyes." During the past winter I examined a large number of birds on the market and in the various stores where dead game was exposed for sale, and almost without exception the specimens which seemed to bear other indications peculiar to the male grouse bore also this orange marking. After my two years experience with grouse in confinement, however, I venture to express the opinion that the "mental characteristics" of the male will always serve to identify his sex as soon as he has become sufficiently accustomed to confinement to allow them to manifest themselves, aside from his peculiar actions in the mating season.

The first week in April had been marked by a heavy snowfall, the heaviest, indeed, during the entire winter. But this soon passed away, and the remainder of the month seemed brighter and warmer than ordinary, and my notes speak of the season as being at least two weeks in advance of the average spring. On the 14th I arranged the nesting coop for the grouse, putting into it a fresh supply of oak leaves and some oak brush to which the dead leaves still adhered. This coop was quite secluded, with a warm southerly exposure, and the rich browse, oak leaves and brush made just such a nesting place as one might imagine the birds would select if they had a whole forest to choose from. And this seems a proper place to suggest that one great secret in inducing wild birds to nest in confinement is to provide suitable nesting places and materials. I have known quail in confinement to pass through the first few weeks of the spring without showing the least disposition to nest, but as soon as the desired material was furnished them, the male began building the nest at once, and in a few days (four or five at furthest) the first egg was deposited. The male grouse, on the other hand, takes no interest whatever in domestic matters of this nature, and if no eggs were laid until he prepared a nest, the grouse family would soon become as rare as the Dodo.

On the morning of April 19, going out early to the coops, I found the Canada grouse standing on a small log, with ruff erected and thrown forward, tail expanded into a perfect fan, and wings drooping to his feet. His eye burned with demoniac fire, and the children, as soon as they saw him, tiptoed cautiously away, and named him "the devil." There was no longer any mistaking the sex, and the sight fully repaid me for all my waiting. The two hens seemed to regard these unusual demonstrations with wonder and dismay, and managed to keep the width of the coop between them and their transmogrified companion. As for the male bird himself, he paid little attention to spectators, and during the first few days devoted the greater part of his time to strutting up and down the coop like a turkey gobbler in miniature. The weather for the week ending April 22 was unusually warm and dry for the season, and on the date named the thermometer stood at 75° in the shade at noon.

On the afternoon of the 23d, the Massachusetts hen having made a nest in the farthest corner of the nesting coop, laid her first egg in the oak leaves. As already noted, this bird had given no signs of laying the preceding spring, nor, indeed, did she manifest any of the restlessness and uneasiness which were displayed by the Ohio hen prior to her nesting at that time. The Ohio hen did not lay her first egg till the 3d of May, but this was twelve days sooner than the previous year. Both hens, however, began laying in the same nest, an unfortunate arrangement that afterward proved the indirect cause of disaster.

On the 23d of April, the first day since the 19th, the male grouse remained quiet and perfectly dejected till toward evening, when he began to strut again as usual. Have noticed that the last day or two he besieges the Ohio hen almost constantly.

April 25.—Up to this date I have seen no evidence that the grouse have mated. Both the hens still seem very coy of the male and keep as far away from him as possible. This afternoon I shut all three birds in the back coop and removed all the perches so they could not get off the ground. After, it became evident that I was interfering with things that I knew nothing about, and accordingly restored the coops to their previous condition. At no time while they remained together were the birds ever seen to mate, the hens remaining shy and distant to the last. What their actual relations were (if any) could only be determined by subsequent examination of the eggs.

May 9.—The male grouse has once or twice showed a disposition to attack the Massachusetts hen and once gave her a severe drubbing, since when she has been very much afraid of him. This pugnacious disposition became so marked that on the 14th I removed the male grouse and confined him in a smaller coop by himself. On the same date the Ohio hen was shut in the back coop, where, after a day of much uneasiness and restlessness, she made a new nest and laid an egg in it on the 15th. This, as before, was a rash experiment, and evidently involved no little risk, but it proved successful so far as to give each hen a nest of her own in separate coops. On the 22d, returning home from a week's absence, I found that the Ohio hen had five eggs in her new nest, but that the Massachusetts hen showed no disposition to sit, although she had evidently stopped laying.

May 27.—The Ohio hen stopped laying to-day; the total number of eggs from the two hens aggregated twenty-two, but as both were laying in the same nest it was impossible to divide the credit. Some careful tests, however, which were completed about this time, with marked eggs, developed the very singular fact that while the eggs of the Ohio hen were fertile, those of the Massachusetts hen were sterile. This would seem to account in some measure for the hostility manifested by the male bird for his Eastern companion. One of my correspondents (Mr. Davison, of Lockport, N. Y.) believes that the grouse is monogamous and that this would explain the action of the male, but the weight of authority seems to be against him.

On the 29th of May the Ohio hen began sitting with nine eggs, the majority of them known to be her own and the remainder in doubt. The Massachusetts hen soon showed the same spasmodic disposition to aid in the incubation as the previous year, and I was obliged to shut her out as before. Thus far, in spite of numerous obstacles and difficulties, all these experiments seemed to progress in the main toward a favorable result. But alas for all human calculations! After sitting five or six days, the hen became nervous and restless from the noise and repeated disturbance about the yard, and early on the morning of the eighth day came off her nest, and at the expiration of the usual time showed no disposition to return to it. The morning passed and not till nearly noon did she go back to her eggs, and then only for a short time. The afternoon was spent again in loitering, and although she returned to the nest at night the mischief had been done. The eggs were put under a common hen, but only one of them ever hatched, and the resulting chick disappeared mysteriously, no one ever knew where. An examination of the eggs confirmed the previous tests, and showed that the majority of them contained chicks in a partial state of development.

That there were numerous mistakes in the plans and methods adopted in these experiments need not be stated. But since everything was of necessity done in the dark, with no precedents as guides, this was not at all surprising. Looking back over the ground it seems probable that all these mistakes could be avoided another season, and yet most unfortunately I find myself without any means of renewing the attempt the coming spring. My original trio of grouse died in July and August last from disease that might have been prevented, if not cured. What became of the three birds obtained last fall Dr. Grinnell has related in the very able article which appeared in the FOREST AND STREAM of Jan. 20. I conclude by saying that I am still confident that the ruffed grouse can and will yet be successfully reared in confinement, doubtless by some one who has more skill, if not more enthusiasm than I. J. B. BATTELLE.

TOLEDO, Ohio, Feb. 15, 1887.

[NOTE: The foregoing dates on which the first eggs were laid by the different game birds named are of interest as going to confirm the belief that under favorable circumstances these birds will nest as early in captivity as in a state of nature. It will also be observed that the dates given in each year are earlier than those of the year preceding. 1884, Virginia quail, July 16; 1885, ruffed grouse May 15, Virginia quail May 16, Arizona quail May 30; 1886, ruffed grouse (Mass.) April 23, ruffed grouse (Ohio) May 3, Virginia quail May 5, Arizona quail May 13.—J. B. B.]

SHORE BIRD NOMENCLATURE.—New York, Feb. 5.—I know none of the local Cape Cod names for shore birds, but am pretty well up in those used at Nantucket, which is almost a part of the Cape. In Nantucket the golden plover (*Charadrius pluvialis*) is generally called greenhead. The later flight, when spoken of separately, are called pale-bellies. The black-breasted or shore plover (*Charadrius helveticus*) is called the beetle-head, the Hudsonian godwit (*Limosa hudsonica*) is known as the humility or hook-billed curlew, while the common name for the turn stone (*Strepsilas interpres*) is craddock. The small Esquimaux curlew (*Numenius borealis*), which flies with the golden plover, is called the doebird. The semi-palmated and other small sandpipers are called peckies.—B.

HIBERNATING SQUIRRELS.

IN my article, published in FOREST AND STREAM of Jan. 13, I made the statement that squirrels are hibernating animals, which I notice has been taken exception to by several correspondents of the paper. One in particular adds to his own personal observations the corroborating statement, "that squirrels do not hibernate in the Adirondacks," by an eminent writer on natural history. Both correspondents lay stress upon their own experience with squirrels, the animals being seen almost any day in midwinter running about in the woods and fields. This fact we know to be true, for in our own Central Park, the small creatures are met with on the coldest days of winter; but in less numbers. They are not perfectly hibernating animals; that is, they do not enter into a state of unconsciousness on the first approach of cold weather and remain so until the warm spring winds renew life again. In my article I qualified my statement by adding the clause, that "from various reasons it is certain that they wake up during the winter time and supply themselves with food." A perfectly hibernating animal does not do this, as, for instance, the bats, hedgehogs and reptiles. The bear is called a hibernating animal, and yet any hunter will tell you that he has frequently met one of these unfriendly creatures roaming about the woods in the dead of winter, a warm spell of weather having awakened him, and the pangs of hunger sent him forth in search of food. The phenomenon of hibernation is still shrouded in considerable mystery, not being so well understood as one could wish; but it is evidently a physiological condition, and not produced simply by cold, though it is favored by it, because cold induces sleep, which may afterward pass into hibernation. The long slumber which many reptiles, mollusks and other inferior organisms undergo in the dry season in very hot countries, is analogous to hibernation, and is certainly not induced by the cold. Many instances are on record where sheep have been buried in snow drifts in Scotland for several weeks without sustaining any injury. During this time the animals were evidently unconscious, and were, in a sense, hibernating, although respiration was maintained during the whole time of their imprisonment.

The fact that squirrels are met with in the winter time should not be construed as convincing evidence that the creatures do not hibernate. It is evident that animals feeding on insects and succulent vegetables could never survive a northern winter but for the sake of hibernation which suspends the need of food. The squirrels lay up a store of berries and nuts for their winter use, and thus probably guard against perfect hibernation, although liable at any moment to pass off into such a state. Much depends upon the system of the animal as well as upon the temperature of the atmosphere. A strong, healthy animal will resist the inclination to sleep longer than a weaker one.

My own experience and observations in this field lead me to believe that squirrels do pass into a state of hibernation during the winter time, although I have never had the opportunity of seeing one in that condition. In a grove of trees close to the house where I was living for two winters on Long Island, two families of squirrels had taken up their winter quarters. I watched them carefully and, while scarcely a day passed but I saw one or more of the small creatures, I soon discovered that some of the family were invisible for weeks at a time. In extremely cold weather I noticed that the animals kept themselves very close in their homes, seldom venturing out except when necessity demanded it. Upon the approach of warm weather, however, every one of the creatures were out, running about in the woods and leaping in playful moods among the branches of the trees. Under these circumstances, I could not say definitely, from my own experience, that squirrels do hibernate even for a short period, but there is room left for a strong belief that they do.

To substantiate my own conclusions I will quote the words of Mr. W. F. Kirby, joint author of "Introduction to Entomology," and writer of the article on hibernation in the new Encyclopædia Britannica, which is still in the course of publication. "Several animals," he says, "belonging to this order (*Rodentia*) hibernate more or less completely, among which we may mention the hamster, the porcupine, the dormouse, the squirrel and the marmot. Several of these awake at intervals to feed and therefore lay up a store of provisions before they retire, although they all become very fat before winter. Other species of this order hibernate less perfectly, or only occasionally, like the hare, which will lie beneath snow in a small cavity just large enough to receive her body, for some weeks unharmed." GEO. E. WALSH.

NEW YORK CITY.

THE TERNS OF MATINICUS ROCK.

Editor Forest and Stream:

In your issue of the 10th inst. Mr. C. E. Cahoon, of Taunton, Mass., expresses his regret that "an honorable and respectable man" like myself should have been deceived in the matter of his killing terns or Medrick gulls near Matinicus Rock.

I thank him for the full value of his estimate of me, and only wish to say for Mr. Grant, who may not see his letter, that Mr. G.'s letter to me was written at my request, as I hoped the fish and game commissioners of Maine might be able to prosecute Mr. Cahoon. Finding there was no law under which this could be done, I authorized the publication of the letter to which Mr. Cahoon takes exception.

In regard to Mr. C.'s statement that he "did not go to Matinicus until the terns had finished breeding," I can say that on my visit to Matinicus Rock, early in July, I was officially appealed to to stop the slaughter. At that time the terns were, to my personal knowledge, breeding.

I have perfect confidence in Mr. Grant, and am satisfied that every statement he has made, as of his own knowledge, is correct. If others gave him incorrect information it was not his fault. I do not wish to be hard on Mr. Cahoon when I add that it remains to be seen that such was the case. E. A. BATCHELLER,

PORTLAND, Me., Feb. 15. Commander U. S. N.

WORDS NOT IN THE DICTIONARY.—The undersigned will be greatly obliged to any readers of the FOREST AND STREAM who may favor him with local phrases and idioms, particularly such as refer to sports of the field; words that have crystallized among the hill towns of New England, or that have sprung into being with new camps out West and grown up with the country. There are idioms and phrases perfectly intelligible in certain localities, but not heard nor understood elsewhere; old words acquire new shades of meaning, and new words are invented. Some of these terms are not to be found in the dictionaries of the day, but the editors of the great Century Dictionary, now preparing, propose to omit nothing that should have a place in its pages.—C. B. R., care of FOREST AND STREAM.

DEER PACKING IN ALASKA.

THOSE who go to southeast Alaska to hunt must adopt one of two means of getting their game to the water's edge; they must either carry it themselves or employ Indians to do it for them, for no pack animals can be obtained there. One superannuated mule was a resident of Sitka until last year, when rumor said he died. He was a relic of the army which occupied the Territory after its transfer, and when the country was evacuated he was too worthless to carry away, and he became, therefore, the sole representative of the equine race in Alaska, and consequently was an object of interest to sightseers. The hunter might adopt the plan of killing all his deer on the beach and thus avoid the trials of packing. Deer make frequent visits to salt water for the purpose of eating the seaweed. They come down for the salt in the early morning and in the evening, and he who hunts them in this way must paddle cautiously along the shore, or anchor his boat in a good spot and cover it with bushes.

Few people, I fear, will appreciate the difficulties of hunting in Alaska until they have been there—the amount of rainfall, except in very favorable seasons, the rocky nature of the region, the density of the undergrowth, the tangle of fallen timber, and the spongy character of the soil they will be obliged, at times, to tramp over.

The first time I went deer hunting in that country I had an Indian with me who did the packing, and I then studied his method, though I did not immediately put it into practice; in fact it was not until I had nearly broken my back carrying the game in the old way that I resorted to the Indian mode, and now I would never attempt any other. The first deer I helped to pack out of the woods I saw on the beach, as a comrade and I were paddling along shore in a canoe; but before we could make a landing the deer had disappeared in the woods unalarmed. I noted the direction in which it went, landed above it and then entered the timber myself. With the aid of a deer call in a little while he was brought near enough to me to receive the fatal bullet. It was a two-year-old buck and it looked so pretty in its entirety that my companion, who came to my assistance at the sound of the rifle, insisted that we carry it down as it lay. It was but a few hundred yards from the beach to where the deer fell, but I can yet feel very vividly how hot the carry was and how deeply the pole cut into my shoulder; every few yards one of us would cry a halt, and the distance was more than doubled by zig-zagging to avoid the tangles of underbrush and timber, but we got the deer into the boat without mutilation.

The next time I had such an experience we lay at anchor in one of the long branches of Clarence Strait that runs into Prince of Wales Island, named by us McLean's Arm. It was virgin hunting ground for the white man, and my comrade and I were the first to get ashore for the purpose of hunting. The time was an afternoon in the early part of September. We landed at the mouth of a little stream, whose valley at this point is not much wider than the stream itself. The water tumbles over a ledge of rock about six feet high, and beyond this the land broadens out into a rounded valley of not very large dimensions. Where the fresh water mingled with the salt the salmon were jumping up in a lively manner, and a few had succeeded in surmounting the falls and were in the pools above. As we proceeded up this valley we saw more bear signs than we had seen anywhere else in southeastern Alaska. The ground looked as if it had been plowed up by a drove of hogs; it was done, however, by the bears after the root of a broad-leafed plant, known up there as the "skunk cabbage." Along the sides of the pools where the salmon were they had worn dusty paths in their efforts to get at the fish, and the trunks of the trees around about were clawed as high up as they could reach. However, we did not see any, for the bear is a wily animal, more cautious in his movements, I think, than the deer.

We soon left the valley and ascended one of the hills sloping to the eastward, where the ground was open and where the deer signs were thick and fresh. We seated ourselves on the right edge of this space, a few feet distant from a small tree; but we were not under any cover whatever. The ground, comparatively open, sloped away from us to a little stream, and the further bank, about one hundred yards distant, was covered with trees and undergrowth. I began blowing the deer call, given me by an Indian at Port Simpson, the ribbon of which was a piece of the yellow silk used to hold the bundles of cigars together. I had been blowing the call, I think, about ten minutes when we heard a noise as of bushes crackling on the opposite side of the little stream, and very soon two deer emerged into the clearing, crossed the stream and came to a standstill about seventy-five yards away from us. As they were approaching us we were as immovable as the tree trunk which was near us. Deer do not seem to detect danger in stationary objects; they depend more upon their sense of smell and on moving objects to warn them when to flee. As soon as they came to a stop I opened fire. The first shot missed, because I had rested my elbow on my knee, which was shaking, the foot not being flat on the ground. The second shot took effect, but the deer bounded off badly wounded.

I now turned my attention to the second deer, which had not moved away, but stood as if stupified, though my companion had been popping at it all the while with his little Colt's revolving rifle. At my first shot he tumbled in his tracks, shot through the neck. This deer I believed to have been only creased, for the bullet passed through the upper and fleshy part of the neck near the base of the skull, but the vertebra was not touched. However, we did not give him time to recover from the shock but settled his "hash" right then with the knife. We then began the search for the first deer, which was very shortly found tumbled into a hole about 50yds. away. All the deer which I have killed, excepting the one just mentioned, have run a greater or less distance after being hit. This has been a surprise to me, for with my rifle, which is of large caliber for such game—.45—I had expected to see them fall to the shock, at least. I have, therefore, concluded that one does not often knock a deer down by a shot through the cavities of the body. I have likewise noticed that when mortally wounded, as all of mine have been, they have always succumbed to some obstruction in their path, such as a hole or a slight elevation of the ground; had the latter been level they would, no doubt, have continued running much further. Our next proceeding was to disembowel the deer and cut away all useless parts, for we had to get them down to the water a mile or so away, and did not wish to be burdened by needless weight. We carried them in the old way, slung a pole between us, and the same amount of fatigue and pain were undergone; finally we were so exhausted that one of the deer had to be left by the way, which necessitated a second trip over our tracks.

The Indian proceeds in the following manner: He makes ropes by twisting the slender branches of the yellow cedar until they are pliable, and with these he sews up the abdominal cut and binds together the legs of each side, a fore and hind leg, after cutting them off at the first joint. He thrusts his arms up to the shoulders through the legs thus tied, and binds the two sides together across his chest by an end of one of the withes left for that purpose. The weight is evenly distributed and firmly bound to the body, his arms and hands are free, and he carries the deer pick-a-pack, neck upward, the head, of course, being cut off. This method of packing deer, when the hunter has to get them out of the woods himself, is so superior to all others that I am acquainted with, I believe it might be adopted with advantage anywhere.

The next time it devolved upon me to pack my own game down to the water's edge, we were at anchor in Steamer Bay, at the upper end of Etolin Island. One morning, as I sat below reading and smoking my after-breakfast cigar, I heard a voice on deck sing out "bear," and quickly seizing my rifle and cartridge belt I hurried up. On the beach, abreast the vessel, about 500yds. away, a big black bear was nosing in the tall grass totally unaware of our presence. We were debating the chances of approaching it in a boat, when one of the men forward, in his excitement, fired a rifle at it and the bear scampered off into the woods. Two of us got into the canoe and paddled ashore to see if we could head off the brute.

We saw we easily could have approached the bear unobserved. The tide was low and a ledge of rock jutted out from the shore, behind which we could have gotten within good rifle distance. We concluded he had gone up a ravine to the right and we therefore bore off to the left to get the wind and to head him off. If allowed a little time to get over his fright he would probably soon stop and begin rooting up the skunk cabbage, if he had not finished his breakfast.

When we reached the higher ground the deer signs looked so fresh and promising that we concluded to halt now and then and call for them. At the third stop I had scarcely begun blowing the call when my companion whispered, "Hold on, there's one;" but as he did not shoot and as I did not see it, I gave another low call, when it leaped into an opening in full view of both of us. It evidently saw me, for I was standing up in plain sight of it. It stood head on, and as I wished a side or quartering shot I blew again to make it move. It advanced, but without changing its relative position to me. I therefore took aim at its forehead and pressed the trigger, and as it swung around to make off my comrade fired. We saw it fall a short distance away from us. My ball had gone through the base of the right ear, and as I stood upon higher ground it entered the body again on the same side, just in front of the hip bone, plowed along the rectum and emerged at the base of the tail. The other ball struck on the same side, about three inches in front of mine, where it entered the body the second time, passed through and to the rear, shattering the left thigh and lodging in the skin of that side. Either shot would have been fatal, but the deer was awarded to me. We soon had it prepared for carrying out, and I mounted it on my back in the most approved Indian fashion, and was surprised to find how easily and comfortable it could be borne. I carried it a distance equal to any of my previous packings, which I found so laborious, and the ground was as much broken and as thickly wooded; I did this not only without fatigue, but without once stopping to rest myself, and at the same time carrying a 9lb. rifle in my hands. Of course the pursuit of the bear was discontinued, and as we were returning to the beach in as straight a line as we could go, we crossed a branch of the larger ravine, up which we imagined the bear had retreated. What was our surprise to find that the bear had gone up this small ravine and was rooting up cabbages a few hundred yards from us at the time we shot the deer.

We got on board just as the others were sitting down to their noonday meal.

MARE ISLAND, Cal.

GROWING WILD CELERY.

Editor Forest and Stream:

I am invited by you to give a plain and detailed statement just how to put out wild celery seed. You ask me to give you just the information I myself was seeking when first I wrote you upon the subject.

I have been instrumental in sowing wild celery seed and planting bulbs in Big Sandy Pond, Jefferson county, contiguous to Lake Ontario. It would be useless for me to advise my friends what to do in case of a desire on their part to raise wild celery. I will simply say to all what I would do myself, did I desire to again reproduce this most valuable plant.

First and above all, this plant calls for wet ground—very wet ground—a pond of water, a real, genuine, old-fashioned slough, plenty of wet muck and loam with an abundance of water. If the water sets over all from one to ten feet all the better. You all know what kind of a pond or marsh is needed to make a first-class feeding ground for ducks. I should make my order for seed or bulbs for a couple of barrels or more. I would place some of the seed at most or all the good places in or about the marsh. I am satisfied this seed will grow in almost any fresh water marsh. What it would do in a salt water marsh I do not know. Whenever I come upon a desirable spot, I would sow a fair sprinkling of seed upon it broadcast, as farmers sow wheat. I would now and then plant a little of the seed, and occasionally a bulb. I would do this at all the desirable places found until my seed was exhausted. Everybody knows how to sow seed broadcast. No instructions are in order as to the matter of sowing. Do it in the usual way.

As to planting. Have made a tin tube, the length depending upon the depth of water it is to work in. Have a plunger made to work upon the inside of the tube. Form a wad of earth, and in the wad inclose a few pods containing celery seed. Place it in the bottom of the tube, inserting it fairly tight. Run the tube down to the bottom of the water, force it into the soil a trifle, and with the plunger force the wad, seed and all, into the mud or soil below. Then let the seed take care of itself. In this way I would continue my endeavors over all the likely places about the pond. I would plant the bulbs on the marshy ground where the water would stand, say about 1 or 2ft. deep. I would plant them the same way as seeds. Were I now to try again, having seen what I have, and knowing what I do about the raising of this plant, the above programme would be very close upon what I should try to do. For seed I would address Mr. D. W. Cross, of Cleveland, Ohio. This plant grows thereabouts in great profusion. Mr. Cross is a gentleman, and withal a sportsman, and I think he knows as much about wild celery as any man in the circle of my acquaintance. He can give as good advice and directions, and furnish the seed or bulbs, or both, at as reasonable cost as any man within my knowledge. I think he wrote me during our correspondence he would charge for seeds and bulbs only the actual cost of harvesting, preparing to ship, and incidental expenses. I think that the seeds and bulbs can only be obtained in the fall, when the water is at its lowest. I know of no other man to order celery seed from.

S. E. KINGSLEY.

HUNTING RIFLES.

My Dear "P.":

The record of your bullet, as written up in the January and February *Rifle*, has given me "more light" upon that cranky lump of inert matter that have all my prior education and experience with that little understood projectile. Never before had I fully realized what was meant by "shock" when that word was applied to the effect of a rifle ball striking an animal. True it must be that if a rifle ball is so constructed that when it strikes an animal it expends its force then and there upon that animal, it must produce more nerve destruction and be more destructive to life than it would were its force but slightly obstructed by passing through that animal, I thank you for that before not fully realized truth.

I shall not agree with you in your statement with reference to the comparisons you make of the 114-330 rifle and the "usually designed American sporting rifles." If a rifle ball has sufficient power to overcome the life of an animal when it strikes it, then a million times more power would be wholly useless; and with reference to the trajectory of such rifles, most of the wild animals that are shot in this country (I mean deer, antelope, elk, bear, etc.) are shot at a sange averaging about 100yds. Let your Bullard .45-85 be sighted for a point blank at that range, and the fall of the ball at 200yds. will not exceed 6 or 8in., if that much. Your 114-330 ball will fall from 4 to 6in. under like conditions, giving it an advantage of but 2 to 4in. Now when you come to make a hasty shot at an elk, deer, antelope or bear, at 200yds. off-hand, or with a catch rest when excited and in a hurry to shoot, is not this a small margin to cavil about? Is there not too much of the "tweedle dee and tweedle dum" Don Quixote windmill about it? I may be wrong with reference to the trajectory of the guns under the conditions named, but I do not think that I am with reference to the difference of the trajectories of these two guns. This wave of low trajectories may have struck you too hard, as has doubtless the theory of the inefficiency of the breechloading rifle when compared with the muzzleloader Major Merrill.

Do you realize that the rapid decimation of all kinds of game in this country has occurred since the advent of the breechloading rifle and shotgun? For a number of years I have made an annual pilgrimage to the once noted hunting grounds of Arkansas. When we first went there there was not a breechloading rifle or shotgun in that part of the State. Every man had his rifle, but it was a muzzleloader of the old Kentucky style. In rainy weather it was too wet, the powder and caps would get damp and would not explode nor the powder ignite, and it was too much trouble to load it anyhow. In cold weather it was too cold, the fingers would suffer in loading, and then only one shot could be had at a drove of deer. In fact it was necessity and not pleasure that induced its use. On our first trip we introduced the breechloading rifle, and from that time they have rapidly taken the place of the old muzzleloader, until now there is seldom found in all that country a muzzleloading rifle, but almost every man of eighteen years and upward has his Winchester, Bullard or Kennedy repeating rifle, and it is in use upon all wet, dry and cold days, it is easy to manipulate and no amount of rain wets its ammunition or cold dampens the ardor of the hunter. Its destructive qualities with the real pleasure that it gives in its use, causes it to be more often used than was the muzzleloader and by a greater number of persons. It is the lazy man's gun, and the lazy man as well as the energetic one, hunts if he does not have to exert himself too much to do so. The result has been the extermination (or nearly so) of the game in that at one time famous game country, and this has been accomplished by the introduction and use of this magazine rifle.

It is useless to try to legislate the game back into its old haunts by the enacting of game laws, leaving lengthy open seasons to the death-dealing magazine rifle and the breechloading shotgun. Make it a felony to own or be in possession of any breechloading firearm and you would have the best game protecting law that could be placed upon the statutes. None of us could now enjoy hunting to the extent that we do if we were driven back upon the use of the old muzzleloader (always, of course, excepting Major Merrill). Such a law would have saved the buffalo and other about extinct game animals that before the introduction of the breechloader roamed in countless millions over the plains and prairies, and in the forests of our country.

To illustrate, let it be a felony to have in possession, or to in any way use a seine net or other device used for the taking of fish other than with a hook or line. In other words, abolish from the United States every device for the taking of fish other than with hook and line, and in less than ten years our lakes and streams would swarm with fish; but such a law can never be enacted. We live in an age of bustling, rushing progress. Years of time are forced into months, and months into days. It is an age of "God save the hindmost," for we have no time to fool away in doing so.

MESTIER.

TALK ABOUT AMMUNITION.

CHARLESTOWN, N. H., Feb. 17.—*Editor Forest and Stream:* I have been reading the letter of your correspondent, "J. M. W.," on the penetration of shot, dated Feb. 2, and am at some loss to imagine what results he expected to get. Did he start out with the idea that increasing the wads would increase penetration? If so, he overdid the matter in a curious way. He starts with no less than five thick wads on 2¼drs. powder, in a 12-bore choke gun, and gets a penetration of fifty sheets of paper. Then he takes out one wad, leaving four, and gets a penetration of seventy sheets. Then instead of trying three wads, and then two, with the same charge of powder, he tries the three wads with an increased charge of powder, or 3drs., and gets a penetration of eighty-five sheets, and then tries two wads on 3¼drs. powder and gets ninety.

Now, it is a wonder to me, that with five wads in such a barrel, he got any penetration at all. It must have nearly exhausted all the force in the powder to blow the wads through the barrel, without leaving any for the shot. No force is gained by increasing the wads beyond enough to confine the gas of the powder so that it will not escape by it. There has been an absurd notion of late years that much is to be gained by greatly increasing the wadding, but there is no sense in it.

I got some excellent results in penetration last fall, while comparing my old Hollis & Sons muzzleloader with a new Fox gun, belonging to one of my sons, with only one pink-edge Ely and one Baltimore felt wad on the powder and one cardboard on the shot. I am sorry I did not preserve the records, but we were testing more for pattern than penetration, and the Fox beat my old weapon badly.

By the way, if the Baltimore people want to keep the market for those wads they must furnish a more perfect article. The box which I bought at Read & Sons, in Boston, contains wads varying from ½ to ⅝in. in thickness, and many of them have crescents cut out of them where the previous wad was struck and are worthless. If "J. M. W." will repeat his experiments and reverse them, putting the heavy wads on the heavy powder, and *vice versa*, or trying all varieties of wad with the same charges, the result will be worth having.

If we were not "knee-deep" in snow, I would go out and do it myself, but it is impracticable in this region just now.

I pity the grouse and squirrels in our woods this winter. Alternations of snow, rain and cold have covered the earth deep with an impenetrable coat of ice that nothing can get through for search of food. We have a family of red squirrels living in our attic and in the hollow walls of the house this winter, and it is safe to say they don't "hibernate" much, in the common acceptation of the term. I am so deaf that they do not trouble me, but my family scold about them not a little. VON W.

IN A GOOSE PIT.

HAVING so much pleasure from reading accounts of hunting, boating and fishing trips in the FOREST AND STREAM, I feel like giving my mite. In the fall of 1885 I was residing on the shores of one of the larger lakes in the park region of Minnesota and was having a grand time boating, fishing and duck shooting. One fine morning about the middle of October, my wife told me she did not want any more ducks brought home; she had had more than were wanted; and I had a well-founded suspicion that my neighbors did not hanker far any more just then. But here I was, right in the best of the season, game plenty, and I had just got my hand in full swing. I did not want to shoot for the market and a game butcher I despise; but something had to be done. I knew the wild geese were feeding on the wheat stubble out on the prairie, and I made up my mind to "lay for them" with shotgun and shoot out of pits. I had had enough of crawling from eighty to forty rods to get within two or three hundred yards of them to shoot with the rifle. I went to C., one of my neighbors, and told him of the trip. C. was plowing, but he had the right stuff, called his hired man and said he would go. We were to take a boat and rig out for camping out two or three days. With a nice breeze abeam, in the warm hazy autumn weather we started for the south shore of the lake, three and a half miles away. Half way across we started some pelicans sunning themselves on a stone reef and almost too lazy to fly off as we slowly sailed by.

At 3 o'clock we landed, and pulling the boat up as high as we could, made fast, shouldered guns, decoys and spades, and went southwest over the prairie a mile and a half, where we came on a flock of geese feeding on the stubble of a wheat field. Of course, they lit out as soon as we appeared. Here was our chance. Walking up to the spot we found two pits already dug, which showed there had been shooting here before. This saved us considerable work. We set out decoys and jumped in, promising ourselves that we would do some terrible execution when the evening flight commenced. In a short time we heard the welcome honk, and a single goose came in our direction from the lake. We lay low, the decoys did their work, and when the goose swung by C.'s musket and my double breechloader paid their compliments and the goose dropped. We felt able to "scoop" Bogardus. Then came honking again. Carefully looking over the edge of our pit we could see to the southwest two flocks coming our way, one a mile off and the other we could just see against the sky. We squatted down low and now they were right on us. Three reports woke the welkin, but instead of half a dozen or so, the least expected, not one goose fell. But there was no time to fool around; the other flock was coming our way. I could hear C.'s iron ramrod pounding while he was muttering something, and I slipped in a couple of shells with a hearty approval of C.'s remarks. But here they were wheeling close by us, now we would have them sure; our guns banged again, but not a feather dropped. We looked at each other with blank astonishment. After a short while another flock gave warning, there they were coming straight for us; we were ready for them with blood in our eye; now they were straight over us, and not—I will draw a veil over our feelings when, in response to our three shots, not a goose nor a feather dropped. It was dusk, and without a word we crawled out of the pits, took our guns and the single goose and started for the boat, which we reached about dark. C. built the camp-fire while I prepared our lone goose. At bed time we crawled under the boat tent, where we were warm and comfortable and soon fell asleep.

But a bad beginning sometimes ends well. We spent one day and a half in the same pits, had glorious weather, took our noon nap when the geese were not flying, shot all the geese we wanted for our own use, had some to spare for our neighbors, and in fact, enjoyed a splendid time, and that ought to satisfy any reasonable sportsman. S.

BELOIT, Wis.

A CAROM ON BRUIN.

THE frequent mention of remarkable shots reminds me that the man that shoots much will be quite sure to score some remarkable hits, also some remarkable misses. But the most remarkable shot that I remember just now, was made by W. Stone, who shot at a live mark for the first time. It happened in this wise. Several hunters started one morning (after a light snowfall) to drive some bears out of a windfall, and with much urging they persuaded Stone to make one of the party, also furnished him with an old musket loaded with an ounce ball. They put Stone on one of the several places where they supposed the bears would be likely to run, and some of the hunters took in other runways, while one or two men put for the windfall. About one hour had elapsed when the roar of Stone's old musket was heard, accompanied by tremendous yells and hallooing, which brought two men on a dead run to learn what the trouble might be. They found Stone standing in his tracks, and pointing toward a bear about twelve rods distant, which lay kicking with its back broken. Stone says that he saw the bear running past and had no time to get a sight, but pointed the gun that way, shut both eyes and fired. While Stone and the two hunters stood over the bear, the third man came up. He was a hawk-eyed old fellow, and before he got up to the trio, he noticed that a bullet had grazed through the frozen bark of a beech tree, and scattered the dust on the new show. Here was a matter that must be looked into, and he did not stop investigating until he had ascertained, first, that the beech tree was about eight rods from where Stone stood when he fired, and that the grazing was a long way out of a straight line toward the bear, and that the ball glanced off on a tangent of 45 or 50 degrees to strike the bear. Had the bullet not turned its course it would have passed the bear some 25yds. one side. The hunters considered that such an unheard of result from such wild shooting was past joking about, and Stone all the while declaring that it was the most remarkable shot ever made, and no one seemed to feel inclined to dispute it. Stone had never been known to fire a gun before, and I have never known him to fire a gun since.

The shooting of that bear, as above described, is an exception to all bear rules, and very likely never had a precedent. I am sure that a bear has as many lives as a cat, which is generally rated at nine. I have never hunted grizzlies, having never lost any, but I have lost several black bears, some of which were mortally wounded, and cost me many miles travel. But his get-away powers are marvelous. Where there seems to be only one chance in ten to escape, he will invariably get the benefit of that one chance. ANTLER.

GRANDVIEW, Tenn., Feb. 14, 1887.

MAINE WINTER NOTES.

IT IS the season when the gun rests harmlessly in the case, and yet when the sportsman reflects that it is the time which tries the game that he loves to hunt, he mentally asks, "How fares the game? Was the last blizzard—the last snow storm—destructive to the grouse? How did the quail stand it? Have the partridges been crusted under this winter as badly as last? Is the snow very deep in the woods where the deer are yarding? Are the last of the lordly moose to be crusted this winter?" This is a string of questions that would be difficult of answer as they should be answered, but here and there a hint from the game regions may give us some light. In the first place the snow is remarkably deep in the north woods, that is, in the wilds of Maine, New Hampshire and New Brunswick. Even down the coast as far as Nova Scotia, reports indicate a hard winter, with very deep snows. One guide of long experience in the north woods of Oxford county, Maine, writes me that he fully intended to have spent the greater part of the winter gumming, an occupation at which he has made $2 per day in other winters, but the snow has fallen so deep and generally so light that he has staid at home, though he hopes to get into the woods on the crusts of March. He says that he has never known the snow deeper in that section. Once he had been into the woods for gum, but gave it up as a bad job after a day or two out, and turned his attention to gathering pine for pillows, which pine he sent to Boston. By the way, these pine pillows are becoming a feature in the best rooms of the Hub houses. takes a fancy to, and filled with the fine-cut boughs of the pine and balsam fir. Then as the husband or brother of shooting and camping prolivities, when he happens to feel blue or bored with cares, why he justs takes that pine They are made of silk, or of whatever material the maker pillow, gives it a shake, buries his face in it, with a long-drawn sniff, and is in the woods again, in imagination, with gun in hand and the balsam trees all about him.

But we started out to look after the game and not to shoot it, even in imagination, though I believe that the laws do not prohibit that sort of shooting, even in close time. The guide writes me that so far as his trips into the woods have extended he is of the opinion that the partridges are wintering well. There have been no snow crusts to trouble them in that section. The deer are remarkably plenty; they are well yarded up by this time and it is greatly to be hoped that the temptation to crust them will not be too great. At Kingfield, Me., in the northern part of Franklin county, three or four live deer have been taken by the boys in the woods where they were lumbering. The snow was so deep that they could run but a short distance, and they were secured without difficulty or injury and brought down to the village for the captors' friends to see. It is understood that the deer were then allowed to depart in peace.

Letters from lumbermen to lumber merchants here indicate that the snow is from five to seven feet deep in the woods of eastern and northern Maine, and if such be the case, as it is without a doubt, then God pity the deer in the Michigan region. The feeling is such that they will be slaughtered there for their hides, if not out of pure spite against those who are trying to protect them. In New Brunswick also the snow is so deep that the lumber teams are getting out of the woods, and the chances of the moose and deer are hard. What the results will be, if these deep snows are followed by crust in March, remains to be seen. At any rate the chances are against the larger game more than for two or three winters previous, which have been characterized by very light snows in February and March—one year with the ground so bare that the lumbermen had to leave the woods for the want of snow, and following which Commissioner Stillwell wrote that nature had saved the deer for one season at least, by giving no snow on which to crust them.

The increase has been wonderful up to this year. Why at this very Kingfield, where the deer have been taken alive by the boys, thirty years ago, such a thing was unheard of? The deer came up to the deep snows of this winter holding their own remarkably well. The Boston market did not get them, and the law was better obeyed among the local sportsmen than usual, but now it looks as though the chances for crusting were to be bad for the game. But those who would like to crust-hunt will be more careful than formerly, for the law is more widely known and understood, and well-meaning people will hesitate more than ever about breaking it. Would that the Maine Commission had the means whereby the law might be enforced as it ought to be enforced. It is painful to think of, that a few idle poachers and crust-hunters can, if the snow happens to be deep and covered with a crust, go into the woods and destroy the whole work of years of deer protection in a few days, when the winter is so far passed that but for the miserable slaughtering proclivities of these game thieves, the worst would soon be over and another season of increase would follow.

SPECIAL.

ADIRONDACK DEER.

Editor Forest and Stream:

A Malone, Franklin county, N. Y., paper has this to say of the Adirondack deer:

"We hear reports every now and then that deer are being killed in the country to the south of us by crusting them, and that the practice is more prevalent this winter than before in many years, There would seem to be a field here for the investigation of a game protector if the State has one in this section who is not afraid to do his duty. Another paper says that Albert Mann, while surveying in the Adirondacks last week, had occasion to cross Twin Ponds, in township No. 9, Malone, and while near the neck between the waters saw an object moving on the ice, which on approaching proved to be a dog eating a deer. The deer was yet alive, but the dog had mangled the body in a fearful manner, the hide was stripped from the flesh in several places, and as Mr. Mann approached, the dog was eating from the hind part of the carcass. The ice for a space of ten rods around was covered with tracks and blood, which indicated that a fearful death struggle had ensued. A short distance from this Mr. Mann discovered another object, and on going to it found it was the half eaten carcass of a noble buck, which had met a fate similar to the first not more than a day or two before. On Tuesday Mr. Mann saw the dog which was killing the deer at the shanty of Charles J. Adams' lumber camp, located in the northwest corner of the town of Duane. The dog is a black shepherd and is owned by a teamster drawing logs to Mr. Adams. At this season when the snow is deep and the crust is sufficient to carry a dog, but not sufficient to hold a deer, it is an easy thing for a dog to overtake a deer while the animal is yet alive, and something should be done to prevent such outrage."

The above, if true—and there is no reason to doubt it—is an outrage on humanity and the people of the Empire State alike.

This comes from the home of Assemblyman Hadley, chairman of the committee on game laws, whose action as such chairman more than that of any other man, made it possible for such an outrage to occur. The writer attended the hearing of the Senate committee at Albany last winter, and listened to arguments in favor of hounding. The speakers said that hounding made deer shy, that dogs never caught deer; that deer simply played with dogs; that they loafed around until they tired of their company and then ran off; that they could run three miles while a dog ran one, etc., etc. When it was suggested that a dog under certain circumstances could catch a deer, they scouted the idea, and when it was said that dogs sometimes ate their victims alive these gentlemen simply laughed the notion down as unworthy of argument.

Here is one case reported. How many have gone unreported? How many deer has this one dog killed and eaten? How many has he killed or helped to kill that have been eaten by the workmen at this lumber camp? How many other camps could be reported in like manner if the truth was known? Dog deer in summer for the pleasure of Mr. Hadley, Dr. Ward & Co. Dog deer in winter for the sustenance of the lumbermen and starving curs. And how long will you have deer? The dogs must go or the deer will have to. Which shall it be?

There ought to be no question in the matter. The Legislature of the State of New York should take the matter up, and in the interest of humanity, if nothing else, make such cruel slaughter of our noblest game impossible. Will they do it? Or has the baying of the hound—so different from the howling of the wolf—and the soft argument of a few persons who want to sit on a log and listen to the music, such a soothing influence that they forget the horrible cruelty perpetrated? Shoot the dog that worries sheep; everybody—even his owner—says so. Make that owner pay the damages, everybody says that is justice. Shoot the dog that eats deer alive, make his owner pay damages, and then let our Legislature express in emphatic language its disapproval of any law that makes it possible to feed lumber camps and howling curs on deer meat in midwinter.

J. H. RUSHTON.

CANTON, N. Y., Feb. 16.

MASSACHUSETTS.—Boston, Feb. 19.—In the Municipal Court on Wednesday, F. A. Belcher and Gilbert F. Quinn, doing business as F. A. Belcher & Co., provision dealers in Dock Square, were arraigned on complaint of the Massachusetts Fish and Game Protective Association, on charge of having in possession ruffed grouse (partridge) during the close season. The case was not pressed because the defendants, who had just started in business, could not have paid the fine and one would have gone to jail. They were let off with costs.—HUB.

ABOLISH SPRING SHOOTING.

Editor Forest and Stream:

At a meeting of the Auburn Gun Club, held at their rooms Wednesday evening, Feb. 16, 1887, the following was acted upon and adopted:

Inasmuch as it is in accord with the sentiment of sportsmen in general and those of the Auburn Gun Club in particular, that the abolishment of spring duck shooting will be beneficial as a means of preserving that species of game and increasing the same; therefore,

Resolved, That the members of this club do hereby respectfully request the members representing this county in the Senate and Assembly of New York State, to use all honorable means in their power for the enactment of such law or laws as will do away with the destruction and murderous custom of killing ducks while breeding and on their way to breeding grounds in the spring.

Resolved, That the secretary of this club be authorized to make copies of this preamble and these resolutions, and forward them to our members at Albany.

CHAS. W. TUTTLE, President.
H. R. KIDNEY, Secretary.
S. F. RATHBUN, Treasurer.

AUBURN, N. Y., Feb. 17.

The following circular sent out by the Monmouth Shooting and Fishing Club, sets forth the opposition of some Illinois sportsmen to the proposed law:

OFFICE OF THE MONMOUTH SHOOTING AND FISHING CLUB.—Monmouth, Ill., Jan. 17, 1887.—DEAR SIR—A bill has been or will be introduced at the present session of the Legislature of this State which has for its object the abolition of spring shooting of waterfowl. Believing such a law would be unjust, we inclose you a blank petition with the request that you get as many signers as possible and forward to your Representatives with as little delay as the case will permit. Our reasons for not wanting this law to pass are numerous, some of which we submit.

First—We believe it is being pushed by a comparatively few who are interested pecuniarily. Just who are the chief backers of the intended change we can only guess. Certainly we know it will put thousands of dollars into the hands of artificial target men, and will not hurt, and may possibly benefit the business of the professional market-hunter, for they can go south and shoot through the winter, while the great majority of hunters are men of moderate means and will not be able to stand the expense of such a trip in order to gratify their love of the sport.

Second—The abolition of spring shooting means to most sections of this State, nothing more or less than the abolition of all shooting; because, as a rule, we have low water in the fall, and low water means no ducks.

Third—It will do no good. The market never has been glutted by birds killed in this State; for where one bird is killed in this State ten are killed in the Southern swamps. Missouri is agitating the question of abolishing spring shooting, but that such a law will be passed is doubtful, and until it is, to ask that the hunters in this State be deprived of their sport in order that the market-hunters of that State may profit thereby is an insult. Nor is this all. For every duck shot in this State while they are passing north, hundreds of eggs are taken from the nests in the north. Eighty millions of eggs were last year shipped out of Manitoba, and yet with this drain on the ducks in the south and on the eggs in the north, we are asked to fold our hands, lest forsooth we will glut the market and exterminate the ducks. Let the change be made at the ends and then it will be time enough to consider the middle. We can possibly stand it to be spit upon but protest against its being rubbed in.

Be expeditious, the other side is hard at work and are backed by somebody's money. We must work also. We would suggest that copies of the inclosed petition be made and circulated in your county so as to save time. Yours respectfully,

MONMOUTH SHOOTING AND FISHING CLUB.

PROPOSED NEW YORK LAW.

FOLLOWING is a summary of the bill prepared by the New York Game and Fish Protective Society, with others, and to be submitted at Albany:

Section 1. Forbids the hunting of deer during the months of November, December, January, February, March, April, June, July and the first fourteen days of August, and the sale or possession of fresh venison during the same time, except during the first fifteen days of November and except as hereinafter provided.

Sec. 2. Forbids the killing, sale, or possession of wild duck, goose, or brant during April (?) May, June, July and August; of quail, robin, meadow-lark, gray or black squirrel, rabbit, prairie chicken, spruce grouse or Canada partridge, during January, February, March, April, May, June, July, August and September, and ruffed grouse or partridge in the same season (except that in the Forest Preserve [Essex, Franklin, Hamilton, Fulton, Herkimer, Lewis, Saratoga, St. Lawrence, Warren and Washington counties] September is an open month); of woodcock during January, February, March, April, May, June, August and September; plover, tatler, sandpiper, willet, godwit, curlew or bay snipe, during January, February, March, April, May and June.

Sec. 3. Forbids catching, killing, sale or possession of brook trout, speckled trout, landlocked salmon, California trout, brown or German trout or salmon during January, February, March, September, October, November and December. In the Forest Preserve the close months are January, February, March, April, last 15 days of September, November and December.

Sec. 4. Forbids catching, sale or possession of lake or salmon trout during January, February, March, October, November and December, and of mascalonge, Oswego bass, large or small-mouth black bass, pike-perch or wall-eyed pike, or fresh water striped bass, commonly called white bass, during January, February, March, April and the first 20 days of May.

Sec. 5. Forbids any person to kill, net, snare, or take by any device or have in possession or sell any night hawk, whippoorwill, swallow, martin, tern or gull, linnet, bluebird, yellow hammer, yellow bird, thrush, woodpecker, catbird, pewee, oriole, kildee, snowbird, grass-bird, grosbeak, phœbe bird, humming bird or wren, or destroy their nests or eggs. Naturalists' permits may be had as under the present law.

Sec. 6. Permits sale and possession of ruffed grouse or partridge, prairie chicken, quail, rabbit, or squirrel during the month of January and the first 15 days of February, and of fresh venison during the months of November, December, January and February, and of salmon trout or lake trout, during the months of January, February and March, provided it be proved that such bird, game or fish was lawfully killed during the period allowed by this act, and not transported contrary to its provisions, or was killed outside the State, at a time when such killing was lawful where killed.

Sec. 7. No person shall at any time in this State kill any fawn while in the spotted coat, or have in possession its carcass or skin, or set any trap or spring-gun or other device for killing wild deer; or hunt them with dogs, except from Sept. 1 to Oct. 5 in each year; nor pursue deer with dogs in St. Lawrence and Delaware counties at any time. Dogs chasing deer in close season may be lawfully shot. No wild deer shall be killed in the counties of Suffolk and Queens at any time within five years from the passage of this act. No person or company shall transport deer or venison killed or caught in this State, except from Aug. 15 to Nov. 15, when they may transport one carcass for any one passenger who is the owner and accompanies it. Does not apply to heads or feet.

Sec. 8. Forbids crusting and yarding deer.

Sec. 9. Forbids at all times chasing or capturing moose.

Sec. 10. Forbids any person or corporation to export from this State to a foreign country, any prairie chicken, partridge, quail, woodcock, wild goose, duck or brant, under a penalty of $10 for each bird exported. It is also forbidden to hunt or kill wild duck, goose or brant, except with a common shoulder gun. They may not be hunted in the night, and no sail or steam vessel may be used in hunting them, except in Long Island Sound, Lake Ontario, and the Hudson River below Iona Island. Floating batteries forbidden; bough houses or decoys to be used not further than twenty rods from shore. This section does not apply to the waters of Peconic Bay, Lake Ontario, St. Lawrence River, Hudson River below Albany. In Great South Bay of Long Island, west of Smith's Point, batteries are permitted in October, November, December, January and February. Sea coots not protected. Snaring and trapping grouse and quail forbidden. Trespass for shooting or fishing forbidden.

Sec. 11. Forbids taking trout or bass or landlocked salmon otherwise than by angling. Forbids taking brook trout, salmon trout or landlocked salmon through the ice.

Sec. 12. Forbids use of poison or dynamite for taking fish; forbids taking fish on spawning beds.

Sec. 13. Forbids transportation companies to carry trout, salmon trout, landlocked salmon from Forest Preserve, except when accompanied by owner as passenger. Forbids taking black bass in waters of Lake Mahopac, or of Columbia county, or of Schroon Lake or river, or Paradox lake, in the counties of Essex or Warren, or of Friend's Lake, in Warren county, or of Skaneateles Lake in the counties of Onondaga and Cayuga, between Jan. 1 and July 1, or in Lake George or Brant Lake, in Warren county, between Jan. 1 and Aug. 1. Forbids killing of trout less than 6in. in length, or black bass or fresh-water striped bass or salt-water striped bass less than ½lb. in weight or 8in. in length. Forbids taking of bullheads in Lake George or tributaries between April 1 and July 1, or pickerel in Lake George between Feb. 15 and July 1.

SEC. 14. Forbids the catching of any kind of fish in public waters by shutting off any portion of the waters.

SEC. 15. Provides that no person or company shall permit any dye stuff, coal-tar, deleterious substance, to flow into or upon any lakes or streams of the State or any bays or inlets along the coast, except when "absolutelely necessary."

SEC. 16. Forbids fishing with seines, gillnets or pounds, the meshes of which shall be less than 2½in. stretched, or 1½in. square (except for bait); to bring fish so taken to the shore or offer them for sale, and such nets, where found, are declared a public nuisance and may be destroyed without liability for damages.

SEC. 17. Relates to private parks, trespass, etc.

SEC. 18. Provides bounty of $30 for grown wolf, $15 for pup wolf, $20 for panther. Prescribes who may recover for violation of the game law and in what manner.

SEC. 19. Relates to jurisdiction, prosecution, etc.

SEC. 20. Supervisors are empowered to legislate for further protection of game.

Sections 21, 22, 23, 24, 25, 26. Authorize search warrants, provide that all penalties shall go to informant; that any district attorney may discontinue suit; that game and other constables, sheriffs and deputies, shall have same powers as game protectors; and that no witness shall be excused from testifying on the ground that his testimony would tend to incriminate himself.

Sec. 27. Provides that nothing in the law shall apply to Lake Ontario within certain limits.

Sec. 28. Land owners may kill birds or animals damaging fruit or poultry.

Sec. 29. Repeals former conflicting acts.

Sec. 30. Provides that seized game may be destroyed or given to public hospitals.

FATAL ENCOUNTER WITH A BUCK.—Brockville, Can., *Times* of Feb. 11 give this account of a fatal adventure with a deer: "Edwin Warren and a companion, Haslip, one evening set some hare traps in the woods. Next morning they went to visit the traps and discovered the tracks of an otter. They at once started to follow the trail, but had not gone far before they were confronted by a large buck deer which the dog had started. The animal at once made an attack upon Warren, who held a short gun in his hand. The young man being on snowshoes could not get out of the way quick enough, and the animal which was mad with rage struck and knocked him down. He managed to get up again, and when the buck made another attack, he struck him with the gun which was loaded. This caused it to go off, the load entering the right leg near the hip joint, shattering the bone. Haslip and the dog succeeded in keeping the animal at bay, which soon afterward disappeared. The snow being very deep the progress of Haslip, who started to give the alarm, was very slow. However, after a couple of hours, the injured man's father came. The unfortunate young man was fast freezing to death as the weather was bitter cold. The old man in his hurry to get to his son forgot to bring some matches, and the terrible fear of being frozen stared them in the face. The injured man kept up good spirits and was kept warm by the dog lying upon him. The old man started to take his son home, but the weather being extremely cold and the snow being four feet deep, the progress was very slow. More help arrived, however, and the party at once started to light a fire, the wounded man being the only one who could strike the matches, the men being benumbed with the cold. A start for home was made. It was an awful journey, the time made being one mile every two hours. The injured man kept up well, and after ten hours of pain and agony he arrived at the village. Medical aid was summoned, but upon examination it was found that the unfortunate young man could only live a few hours, as the leg which had been broken was frozen to the body. Medicine was administered to ease the terrible pain, and after a few hours death put an end to his sufferings. The young man had only six months before taken unto himself a wife, who is nearly distracted over the sad and terrible end of her husband. The funeral was one of the largest that has ever taken place in Parry Sound."

THE PROPOSED ALASKAN EXCURSION.—*Editor Forest and Stream:* I have received from the two brief notices that appeared in FOREST AND STREAM, letters from numerous people in the United States and England. Most of the letters are from sportsmen. The letters all contain the same general inquiry: "What is being done?" It has taken much longer than I had anticipated to make the necessary arrangements on the Pacific Coast, in which I have received and am yet receiving valuable assistance from Mr. J. M. Buckley, Assistant General Manager Western Division of the Northern Pacific Railroad at Tacoma, W. T.; also Mr. Wm. H. Whittlesey, custom-house broker and agent of Northern Pacific at Port Townsend, Wash. Ter. The latest news is that the steam schooner Leo is suitable and can be secured, and that they are in communication with her captain as to terms and will advise me soon. The general plan, so far as yet outlined, is to go to Tacoma, on Puget Sound, in a car which the railroad will be only too glad to give a party of thirty for its exclusive use, with a baggage car for the baggage. From Tacoma to Cook's Inlet, Alaska, it is proposed to go in a vessel chartered for the purpose, to remain with the party all summer. While on the coast it is proposed to live aboard and camp out inland. The largest number of mammals, the breeding grounds of water fowl, and the finest salmon known are found in the section we propose to visit. The regular line of steamers from Port Townsend to Alaska only touch at Wrangel, Juneau and Sitka, in the southern portion of Alaska, and her, access to the interior of the country is barred by mountains. But the portion of Alaska accessible from Cook's Inlet is the sportsman's paradise, for here are found brown and black bears (the brown as large as the grizzly and as fierce), deer, reindeer and the woodland caribou, big-horn mountain sheep, beaver, land otter, large gray wolves, lynx, wolverine, marten, mink, ermine, and many others. The bears have been seen feeding in droves of twenty, and trails have been worn over the hills and mountains by them. A brown bear, shot at the Kenia Mission in the summer of 1880, measured 9ft. 2in., and reindeer have been killed by the hundreds merely for their skins while crossing the Kivachak River. Here are also found grouse, both white and ruffed; geese, ducks, sandhill cranes, and the great northern swan, in countless numbers. Those who accompany this party can really say they have been out west, for one place we will visit is the island of Attoo, which is 2,800 miles west of San Francisco, as far west of San Francisco as Calais, Me., is east. It is desired to make the party up of "old campaigners" who can put up with inconveniences for sport's sake, and this is the reason I have not encouraged the scientific and college men, because they are unaccustomed to roughing it. Some of our English cousins have expressed a desire to accompany the party, among them Mr. A. W. Craig, of the Junior Carlton Club, London, who hunted in Wyoming two years ago. Those who desire such a summer's sport with the salmon, large game, and water fowl, I hope will communicate with me at once. Starting from New York, May 15, or June 1, we expect to return by Sept. 15, and the cost including the round trip and board will probably be $500, but may be more. This can only be determined after further news from Puget Sound.—J. E. PALMER (115 Greenwich ave., New York).

HAWKS, OWLS AND GAME BIRDS.—Mr. Daniel Steck, of Harrisburg, Pa., writes of the effect of the scalp law on the game supply: "Poultry was never so plentiful and cheap in Williamsport as during the present season, and greater quantities were sent to distant markets than ever before. Game was never more abundant in the history of the county. The cause is of course attributed to the destruction of owls, foxes and mink during the winter of 1885 and 1886. If each of the 1,700 animals killed had destroyed during the whole season but a single brood of pheasants, a brace or two of rabbits, and as many chickens and turkeys, the amount would have been enormous; yet it would be an insignificant amount of food for each animal to consume in a whole year. The writer has known a single pair of minks to destroy twenty-seven half grown chickens in one night. A single dealer in poultry and game in the city of Williamsport reports having handled the present season 2,700 pheasants, not quite so many rabbits, because every marketman that backed his wagon to the curb dispensed the cottontails with a liberal hand. Of the pheasants about one-third were shipped to distant markets, for the reason that the market here was overstocked. Never had enough to supply the home demand before. It would be safe to estimate that Lycoming county is richer at this time by more than the whole sum paid for the scalps of noxious animals since the passage of the bounty act, from the sale of game and poultry to distant cities, that never would have grown to reach a market but for the protection it furnishes. That citizen manifests but little consistency who asks for enactment to protect the game and fish of our forests and streams—to prevent hunting and fishing except for a few months each year—while at the same time clamoring for the repeal of an act that prevents thousands of hunters and fishers from plying their vocation from day to day during the whole year. (Minks destroy thousands of trout after they ascend the smaller streams to their spawning grounds)."

T. B. ALDRICH AS A YOUNG SPORTSMAN.—A good many years ago now, a small bare-legged boy set out from his home in Portsmouth, N. H., for an afternoon's sport with a gun. He rambled along, as boys will, with his eyes wide open for everything that came under them, as well as for game that was the special object of his expedition, and he had not gone far when he saw a chaise approaching, driven by the Governor of the State. The Governor was a very popular and distinguished man, who was being talked of for the Presidency, and we should not have liked the small boy if he had not been a little overawed by finding himself alone in the presence of so august a personage. He was equal to the occasion, however, and as the chaise reached him he stood aside to let it pass, and gravely presented arms. The Governor at once pulled up his horse and looked with amusement at the little fellow standing there as serious as a sentry with his gun held rigidly before him. "What is your name?" said the Governor. "Thomas Bailey Aldrich," said the boy, with a military salute. He was invited into the chaise, and though he lost his shooting, what was that in comparison with the distinction of riding into Portsmouth town with Governor Woodbury.—ST. NICHOLAS.

Buffalo Domestication.—*Editor Forest and Stream:* In 1872-73, in northwestern Kansas, I secured between forty and fifty buffalo calves. Of these I managed to raise seventeen, which ran with the cattle on my father's ranch. About three-fifths of the calves caught would die, although I have had no trouble in raising nine out of ten antelope in the same way. We gave them nothing but milk. When I left the ranch the buffalo were three and four years old. We had several half-breed calves from our native cows, but none from the buffalo cows. One of the buffalo would never leave the ranch house to go further than two hundred yards, unless it were to follow my mother when she would take her evening walk. He was much attached to her, but was quite belligerent toward the rest of us. This buffalo had been picketed when a calf, and the strain of the rope had gradually turned his horns until they grew down his cheeks with the points turned in.—F. T. Webber (Fillmore, Utah).

A Pennsylvania Case, in which a big fine is involved, is reported by the Troy, Pa., *Gazette*. Four boxes recently delivered at the Adams express office at Towando, and consigned to New York parties, were found to contain quail, which were out of season. The shippers, G. C. Barnes, of Asylum, Pa., and his son, were arrested, convicted and a fine of $2,212 has been imposed. The case has been appealed.

A Successful Hunt.—Toronto, Canada.—Last fall I went with a party of hunters and trappers on a moose hunt and we had good sport capturing two moose, one very large black bear and a number of red deer.—C.E.R.

Havre de Grace Ducking.—Philadelphia, Feb. 18.—Advices from Havre de Grace state that the ice is going out and that they expect shooting in a few days.—Red Irish.

New York Life Insurance Company.—The report of the New York Life Insurance Company, which we print this week, gives some interesting facts and figures on the growth of a well managed company. After forty-two years of existence it has reached a point where it has a total income of over nineteen million two hundred thousand dollars, and makes payments to policy holders of nearly eight million dollars. Its interest income is over three million seven hundred thousand dollars, being over 5½ per cent. on average net assets, and over nine hundred thousand dollars in excess of losses by death. It shows an increase of over three million dollars in income, over two millions in surplus, over eight millions in assets, over sixteen millions in insurance written, and of over forty-four millions of insurance in force, over the figures of the preceding year, and has over three hundred million dollars of insurance in force, Jan. 1, 1887. This is certainly a remarkable showing and should prove deeply interesting to all who have life insurance under consideration.

Sea and River Fishing.

Address all communications to the Forest and Stream Pub. Co.

FISH AND FISH PROTECTION.

IT MAY seem odd that at this late day it is necessary to say a word in favor of the protection of fish in our waters, but notwithstanding the fact that rigorous laws have still preserved salmon in the rivers of Europe amid densely populated districts, and have preserved brook trout in streams near large cities like New York, where, but for these laws, they would have been netted out a generation ago, there are still those who oppose all legislation on the subject. In the State of New York there are persistent bands of poachers who resist the officers of the law at times, and not only receive the approval of their neighbors, but also the support of the legislators elected from their districts. It was at the instance of the members of the Legislature from Yates and Ontario counties that the bill was passed permitting the spearing, netting and catching through the ice of fish in Keuka and Canandaigua lakes, and the presumption is that this measure is in accord with the wishes of their constituents.

It is a well known fact that there are no worse enemies to the laws for the protection of fish than the people who live on the boarders of the large interior lakes of New York. They consider that the fish in these lakes are their exclusive property, and resent all interference by the people of the State, who are the real custodians of the fish in all public waters. The farmers near the lakes of Yates and Ontario counties have, since the early settlement of the country, been in the habit of taking lake-trout from the spawning beds and salting them down for winter use, and they still look upon this as their inalienable right, a view that is so radically wrong that their minds should be speedily disabused of it by the people at large through their representatives at Albany.

The Commissioners of Fisheries have the power to aid in this matter by instructing the superintendents of the State hatcheries not to stock nor supply fishes of any kind to lakes where spearing, netting or fishing through the ice is permitted by law, and we hope to see some action taken by the Board at its next meeting, to instruct the superintendents to refuse all applications for fish which are made for waters where such fishing is permitted. If public sentiment in any locality is against protecting fish, then that community should be cut off from all benefits in the way of having their waters stocked by the State.

Surface Schools of Fish.—In regard to this subject "under fire," I agree with "Jay Bebe" in his article in the Forest and Stream of last week. During very many years trout fishing, especially trolling in Round Lake and the Saranac lakes, I have every spring witnessed schools of fish floating leisurely along on the surface of the water, and have had them within 10ft. of my boat. The subject has been many times fully discussed by sportsmen and guides, and the conclusion arrived at is that the fish are suckers, schooling before seeking deeper water, and I am convinced of it. The writer has never seen them except when the water was getting quite warm, and he has seen them every season for the past thirty years. They were not trout. I have tried in vain to catch them.—Delta Adirondack Suburbs).

ANGLING IN THE HEBRIDES.

THUMP! thump! all night long, beat the pulse of the steamer Dunara Castle, and two loquacious Scotchmen spent nearly as much time, just outside of my berth, in trying to find a "night-cap" that would fit. This they accomplished at last, or perhaps the night-caps gave out, and I was left to twist my eight feet (only two requiring shoe leather, the others preferring trowsers and coat) in a five-foot berth.

Balmy sleep (we had a load of cattle aboard) came at last, and then the next thing I heard was a rough voice say: "We're off Colonsay." We were to disembark here, so in a few moments I was on deck. We were anchored in a little bay a few rods from shore. The dozen houses had emptied themselves of the natives, who were now busy in shouting Gaelic (garlic as pronounced by them) and launching a huge long boat to come for us. When they had rowed their ark alongside, very little was to be seen of the boat, for every available inch was occupied by a man or boy. Barrels and boxes, baskets and bundles of all kinds and sizes tumbled into the boat as she rose and fell in the surge. Finally our turn came, and what a time we had! Waiting till the boat rose nearly to the bottom of the ladder we would step off and then down, down would sink the boat seemingly from beneath our feet, and then recovering itself would go rushing up the iron sides of the steamer in a frightful way, though fascinating. Seen from the steamer, the long boat appeared clumsy and logy, but now after resting for a moment in a pocket of the waves, then mounting to the top, she would swim down the other side like some huge sea-bird full of grace and life.

Upon landing we were stared at by that small portion of the inhabitants who had not gone off in the boat to meet us. After collecting our twenty-two bundles (the twenty belonging to the ladies), we inquired for Donald, our cousin's Poo-Bah, for he was the coachman, skipper, gardner, weather prognosticator and adviser on all subjects of Oronsay. Withal he was a modest man, and so he was the last one to be asked "Are you Donald?" Acknowledging himself to be that all-important personage, he produces for carrying five people, who attained their growth several years since, but whose bundles appeared to have grown and multiplied indefinitely ever since leaving Greenwich, a dog-cart. Donald looks at us, then at the bundles, finally at the cart, and murmurs in his soft voice, "It *is* a bit wee." We get in, however, three on the front seat and two on the back (told to sit hard and heavy), and taking such bundles as we can hold, give the horse his head. This not being sufficient, the whip is added with the desired effect.

How wild and desolate everything is. Masses of heather-covered rocks; ragged hills, unsoftened by trees; meadows of rank grass, on which feed some tawny Highland cattle. It is like a forgotten sketch of an artist, rough though strongly drawn, but with the coloring—the warmth of life—unpainted.

The two islands, Colonsay and Oronsay, are connected for an hour at low tide by a narrow stretch of sand showing above the water and covered with the pyramid markings of the sand worms. The flowing tide covered these and nearly a foot of our wheels before we reached the other side, but the horse splashed on as though he were on a turnpike. Donald amused himself by telling how, a few weeks previous, the west wind blowing in the water quicker than usual, the wheel of the cart struck a sunken rock and pitched him headlong into the water. Each of us instinctively sought the middle of the cart when he finished, and we had looked at the icy water. We reached Oronsay in safety though, and a few moments more brought us within sight of the monastery. Generations ago a small band of monks persecuted and at last driven from the north of Ireland, first landed here, and the lonely island afforded them a safe haven for their prayers and meditations. Of the original chapel and cloisters only the thick stone walls and a small portion of the roof remain, but enough to show the rough beauty of the carved pillars and windows. In one corner of the chapel lay three or four stone coffins, the last resting place of the holy men, with their images carved on the slabs. Time and exposure had scattered even the dust from within. A few yards from the building stood a stone cross, exquisite in shape and proportion. The dead gray of the sky, the beating of the ageless sea upon the rocks, the crumbled mass of the sacred buildings, all were of the past. The cross alone remained. The more modern building our cousin had made habitable for a month or so in the summer, and life was not wanting there, nor comfort and plenty.

We spent four days on Oronsay and did nothing twice. The first evening about 8 o'clock Donald produced two poles 10ft. long, to which were attached by strong linen lines two huge yellow flies, and asked if I wanted to go fishing. I always say "yes" to such invitations, but was somewhat staggered by the looks of the tackle. A few moments found us rowing outside the breakers, Donald working the oars, while I sat facing the stern, and having inverted the poles with their tother ends in the water sawed them up and down, apparently seeing how many times I could "touch bottom" a minute. What antics those flies cut up a few feet astern! Swish, went the line, circling toward the bow with a tremendous rush. My tackle, thanks to its size, held, and in a trice a fish of about 2lbs. lay struggling in the boat. The Gaelic name for it I have forgotten and its looks—well, it was a little like a herring and more like a trout. It was all so novel. The small boat tossing near the breakers as they rolled from black to foamy white; the soft light of the sunless sky; the gulls shrieking in our wake for a fish; an old gray seal drying his whiskers as he looked around out of the water for the same purpose.

The next morning we started out to examine the lobster creels we had placed the night before. We only found four, but one creel was alive with delicious crabs. What a bloodthirsty set they were! Crawling around on the bottom of the boat, the moment two of them came together, there was trouble, and the weaker generally scrambled away, wiser to the tune of a "lost cord," or rather claw. Before we had landed the boat looked like a pension office on pay day, so many veterans were limping around on wood. After a dinner made of lobster principally, while Donald was testing some "Lone Jack," puffing out great clouds of smoke after each deep breath, and wondering where it all came from (being used to molasses-soaked "plug" which required an exhaust pump to keep the fire in it from going out), I asked him what we should do the morrow. His lips scarcely opened, but the delicate trail of smoke formed "trout" in feathery letters.

Early in the morning the dog cart, with lunch and borrowed rod and tackle, was ready, and then an hour's roll over the sandy reach to Colonsay, and back over the barren hills and half way down the other side a turn to the left and—"Are there trout in that place, Donald?" I asked, wondering how a high-toned color fish like a trout could soil his spots in such dirty water. It was like that in South street, New York, when the East River gets its back up. We soon found the one boat, and after getting the tackle in shape tumbled in and almost tumbled out again, for that boat, in spite of its ample bottom, had a habit of spinning around that was decidedly skittish and unbalancing in its tendency. My first cast proved conclusively that the bow seat was the place for me, for every motion of my wrist and rod was followed, and instantly, too, by a counter motion of my feet and the boat, and in my efforts to keep erect snap went the tip, short off. An extra tip was found, and taking a seat this time, the flies flew to the desired place and spat! spat! went half a dozen fingerlings, as they somersaulted out and in the water again. The trout seemed to be of but two sizes, scores of little shavers and now and then a handsome one of a pound. Three hours later I had thirteen of the latter in my basket and had sent five times that number home with the toothache. The next day we took a long walk along the rocks and coarse grass by the shore, flushing every now and then, though the season was late, an eider duck ("duke," as Donald called them). Going to the place where they got up, we would find from two to five huge eggs, protected in a rather unsavory way by the old "duke" the last moment before rising.

Scores of seals, big and little, were to be seen sleeping or sunning themselves out on the rocks left bare by the fallen tide. Clicking two stones together would start them for the water in an ungainly waddle and a moment later they would pop their heads out of the water, their protruding eyes curious to see what it all meant. On our way back we ascended a high hill and, driving hundreds of "bunnies" before us into their burrows, examined the summit where there was once one of the forts of the islanders, to which they retreated on discovering the approach of the dreaded ships of the Norsemen. Little remained besides the mound of earth and heaps of shells to tell of the unequal struggles against murder and starvation.

A month later I stood in the National Museum at Christiania, Norway, examining the much written about Viking ship, the very one, perhaps, that carried terror to the hearts of the peaceful dwellers of Oronsay.

F'LIN.

THE ROD AND REEL ASSOCIATION.

WE learn that many prizes have been secured for the coming tournament in May, and that there is every prospect of a successful meeting. A proposal has been made to establish something like a social club, and a circular has been issued from which we quote as follows: "Four tournaments have been held with much success, and the one for the coming May promises to be still more successful. But heretofore nothing has been done toward the cultivation of the fraternal feeling of the constitution. This the officers of the Association now desire to do by renting one or more rooms in some locality of easy access in this city, furnishing the same and providing a suitable angling library for the use of its members. By this means members would become acquainted with each other, and those living out of town would have some convenient headquarters where they could pass their leisure hours. Whether this plan is feasible depends on the activity of those at present in the Association in securing membership, and in the liberality of all concerned. We would be happy to hear from you on this subject, particularly as to what you personally are willing to do to further the same."

Social angling clubs are common in England, and the members meet and have dinners and sometimes listen to papers on various subjects connected with angling. One of the most valuable of these is the Fly-Fisher's Club, of London, which has just issued its second annual report and balance sheet, which was presented at the annual meeting on Jan. 27. From this we learn that the club is progressing and has at present 271 members, made up as follows: Town members, 120; country members, 143; honorary members, 8; and the balance in the treasury amounted to nearly $600. The annual dinner takes place at the Holborn Restaurant, Feb. 24, and by the rules of the club each member is allowed to bring two friends, dinner tickets cost about $2 in our money.

It has been said that the anglers of America are not as sentimental nor as gregarious as those of England, and we will watch this proposition to form a social club with interest. We think it a most excellent idea and hope that it will meet with favor from the members and that a strong and healthy organization may result from circulation of this circular. Those who are interested may address the Secretary, Mr. Gonzalo Poey, 24 State street, New York.

Portrait of Francis Francis.—We have been requested by Mr. Hallock to publish the letter given below and to request a response from any reader who may know anything of the missing picture. Mr. Francis writes as follows: "The Firs, Twickenham, Jan. 17, 1887.—*Dear Mr. Hallock:* A good many years ago—over twenty—a portrait was painted of my father by Rolfe and a man named Forster—Rolfe painted the fish. The accompanying engraving was taken from it, but the engraver has barbered and valeted my father a little on his own responsibility. The picture was eventually sold to some one (an American?) who took it to America. Rolfe is dead, and Forster (who was a sort of assistant of his) can give no further information than this. As the picture was the only one ever painted of my father, I should like, if possible, to trace it: if it were to be bought reasonably to buy it; and if not, at any rate get a copy of it. It seems a hopeless task I admit, but if the owner knows whose portrait it is, it is just possible that the whereabouts of the picture may be known to some of your sporting friends. Can you suggest any means of tracing it, or any scheme of advertising for it, that would not be absolutely ruinous? Yours faithfully, Francis Francis, Jr." The picture represents Mr. Francis and his gillie seated by a mountain stream, and before them two salmon. Francis holds a rod and the gillie a gaff.

A STRANDED MUSKALONGE.—During the freshet in the River Raisin in Michigan a few days ago, the bottom lands and meadows along the stream were suddenly inundated to a depth of 3ft. When the waters subsided dozens of pickerel and perch were left stranded in the meadows. On the farm of Levi Buck, three miles west of Monroe, a muskalonge, weighing 30lbs., was found "alive and kicking," duly captured and eaten by an appreciative party. Fish of this species have been rarely seen in the river for several years, and seldom, if ever, further up the stream than a mile from Lake Erie. The point where this huge specimen was taken is six miles from the lake. Spearing fish through the ice on the lake has afforded unusually fine sport during the winter, and some very large catches are reported. The late break-up has put an end to the same, and the fish houses were removed to the shore just in time to secure them.—J. M. B.

NEW BRUNSWICK FISHING LEASES.—Anglers should not neglect to note the advertised sale of fishing leases in New Brunswick. The date of sale has been postponed to March 30.

IZAAK WALTON'S HOUSE is among a number of ancient London dwellings reproduced in the Old London Street exhibition just opened in this city.

Fisheulture.

THE COLORADO COMMISSION.

THE report of the State Fish Commissioner of Colorado for 1886 is noteworthy as showing the great interest taken in this important work in a State as new as Colorado. There is but one Commissioner, Mr. John Pierce, of Denver, who says in his report that on taking possession of the office in April, 1885, he found at the State hatchery about 7,000 breeding brook trout from one to three years old, 16 rainbow trout three years old, 16 carp of the same age, 3,000 rainbow trout fry, 100 carp of one year old and 150,000 fry of the brook trout. The rainbow trout were retained at the hatchery for breeders, while the brook trout were distributed in public waters. The hatch of 1886 was as follows: Brook trout 300,000; rainbow trout, 20,000; lake trout, 10,000; landlocked salmon, 8,000.

Section 10 of the fish laws of the State allows the Commissioner to sell fish to private parties, corporations and associations, owning lakes or ponds, and Section 1 of the same laws allows him to issue permits to parties who desire to stock lakes, to catch fish for this purpose by other means than with hook and line. The Commissioner states that both of these clauses are liable to abuse and have been abused in almost every case, and that he has adopted the rule to put all trout hatched by the State into public waters and has issued no permits for netting or trapping. The result has already shown the wisdom of this course, for some of the persons who were formerly in the habit of purchasing fry from the State hatchery have now built hatcheries of their own and there are at present in the State seven of these private hatcheries in successful operation, which have a capacity of about 1,000,000 eggs, and these, while they belong to private parties and of course do not help stock the public waters of the State, they actually add so much to the food products. The value of trout to the public waters of the State is not so much the value in the number of pounds of food which they will produce as it is in the attraction to visiting sportsmen who leave much more money in the State than the value of the fish which they catch. The Commissioner very truly says, "it would be safe to estimate that every trout caught in Colorado by visitors from abroad costs the catcher at least $1 and that each fisherman will spend $10 a day while he is in the State, and if only 100 fishermen are in the State during the fishing season, they will leave in the State $150,000, while the market value of the fish caught in the season is not far from $60,000."

Under the head of fisheulture the Commissioner states that he has received and answered over 500 letters concerning the culture of the different varieties of fish, and having no literature on the subject for distribution, the task of answering these letters has been enormous, and therefore he gives some hints regarding the culture of fish adapted to the waters of Colorado. It appears to us that his predecessor should have turned over to him the reports of the United States Fish Commission, which are in themselves a liberal education on the subject of fish and their culture if he had them, and that besides these reports there are standard works on the subject which should be in the possession of a novice in the art. Among the fish which he recommends are trout of three varieties, "which, though usually classed as one, are sufficiently distinct in their form and habits to be described as distinct varieties." And here is where we get mixed between the "black speckled trout," the "orange trout" and the "Twin lakes trout." When we get down to the rainbow trout we think that we recognize the species, also that of the English trout (*Salmo fario*), which the Commissioner says grows to one-fourth of a pound the first year, but in our experience, which has been as large as that of any person in America, we should cut this down to one-half of that weight, while concerning the eastern brook trout (*S. fontinalis*), which is credited with "growing to one-half pound weight in the first year after it is put out," we can only say that we never saw any such fish of such a weight. It is thought that this fish will prove a failure as a breeder in the mountain streams of Colorado, for like the *fario* it "spawns in November, just at the time that the anchor ice begins to form in all the mountain streams, and the chances are that the ice will destroy the eggs."

In a description of a hatchery on page 12 the statement runs very well until we reach the bottom of the page, when we are told that the bottom of the trough should be covered with "clean washed gravel, sifted through two sieves, so that the gravel will be about one-fifth of an inch in size." This was the mode in use 20 years ago, when we began fisheulture, but has not been used in any hatchery which we have visited within the last 15 years.

Among the other fish introduced into the State is something called "strawberry bass;" what it may be we do not pretend to say, but it has proved wonderfully prolific in the prairie lakes, so much so that in some of them they are said not to grow large because of the scarcity of food. Last year 20,000 young black bass and pickerel were planted in four lakes and have made a wonderful growth, said to be three pounds in one and a half years, although which species made this growth is not stated. It is possible that the Commissioner has made a serious mistake in introducing the pickerel, which consume more good fish in the course of a year than ten times their own value.

Under the head of ways and means, the Commissioner, who, under the law, was allowed to draw $500 as salary and $500 as expenses, makes the following statement: "The value of the hatchery to the State, not only for its contributions to the public waters, but the actual value of the breeding fish on hand is so great that I have preferred working for nothing rather than stopping the work there. I have received from April 8, 1885, to Dec. 1, 1886, $197, which about covers actual expenses that have not been charged." This is an exceedingly creditable showing for a commissioner who might just as well as not charge the round sum of $1,000, and shows that he is a man whose heart is in the work, and will, no doubt, unless politics or some other thing intervenes to remove him, make a most valuable and efficient officer for the State. His report is condensed, and although brief, contains a complete record of the work in a small compass.

THE NEBRASKA COMMISSION.

THE eighth annual report of the Nebraska Fish Commission for 1886 has been received. It opens with a commendation of the efficient labors of Superintendent Martin E. O'Brien, and a recommendation that his salary be increased. The culture of carp is on the increase, but difficulty in obtaining reports from individuals who have received fish causes rather meagre returns of the success, many persons have reported, and as a rule their reports contain facts that are encouraging, no case having been reported of a failure through accident or misfortune. The Commissioners commend the food quality of the carp, and say that the facilities in the State for private fish ponds are not excelled by those of any other State in the Union, and that there is no doubt that within a few years the fish-growers of Nebraska will be found in the markets with the product of their ponds alongside of those of the fields.

The brook trout planted by the Commission in 1884, 1885 and 1886 in the streams of the northern and western parts of the State have lived and made excellent growth, while the work of the Commission with black bass has been attended with gratifying results. In every instance where these latter fish have been planted reports have been received that the fish are doing well in private as well as in public ponds or lakes. The Commission has increased the facilities for breeding these fish and will, no doubt, be able in a short time to supply black bass for all the waters of the State. The wall-eyed pike has also received much attention, and it is recommended that the work of supplying them to the lakes and streams should be continued until every lake and stream adapted to them shall be well stocked with valuable fish.

The Commissioners again recommend that the law prohibiting the taking of fish in the inland waters of the State with seines, nets or other devices except hook and line, should be amended so as to more clearly define the distinction between private and public waters. They also recommend that an appropriation be made for establishing a museum in connection with the fisheries, where specimens of the different fishes of the State may be collected and preserved for purposes of study.

Commissioner W. L. May makes a report to his colleagues concerning the fish exhibit at the Nebraska State Fair, held at Lincoln, under instructions of the Board, in order to further the interest in the subject of fisheulture and to show to some extent the character of the practical work accomplished by the Commission in introducing and propagating the species best adapted to Nebraskan waters. Live specimens of fish cultivated at the State hatcheries and specimens of native fish, such as pickerel, black bass, hickory shad, buffalo fish, catfish, bullheads, sunfish, quillbacks and other varieties, with a varied collection of specimens of water inhabitants not belonging to the class of food fishes, were exhibited. Included in the display were hatching jars and other apparatus showing the methods of propagating, and illustrating to a limited extent the character of the work done at the hatcheries.

From Superintendent O'Brien's report we find that there were distributed last year 5,050,000 wall-eyed pike, 108,000 brook trout, 55,000 salmon trout, 9,000 California mountain trout, and 8,720 German carp, leaving 3,000 of the latter on hand to be distributed in January of the present year. During the past season the facilities for hatching and distributing fish have been greatly increased, and the Commission now has the capacity for handling 35,000,000 young fish annually, besides increasing the facilities for hatching. Two new fish ponds have been added, making altogether twelve ponds, with a surface of about three acres, which contain a stock of about 55,000 fish of different varieties, from one to three years old. This is followed by directions for the construction of carp ponds, and a list of the number and kinds of fish in the stock ponds, and also the details of the distribution last year.

FISH PROPAGATION IN MICHIGAN.—The State Fish Hatchery at Detroit was inspected a few days since by the Legislative committee, consisting of E. B. Chamberlain, of St. Ignace; E. Z. Perkins, of Cheboygan; R. Y. Ogg, Detroit; S. Baker Monson and C. Wellman, Port Huron. The work accomplished by the hatchery during twenty-five months ending October 31, 1886, was reviewed and showed that during the time named there were distributed and deposited in designated streams and lakes in Michigan 101,620,000 white fish; 1,127,000 brook trout; 705,000 lake trout, 1,806,244 pike, 71,000 salmon, 325,000 eels, and 5,510 carp.—J. M. B.

FORESTRY CONGRESS MEMORIAL.

To the Senate and House of Representatives in Congress assembled:

Your undersigned memorialists respectfully call attention of the National Legislature to the urgent necessity, so long overlooked, of considering the requirements of the country in regard to a more conservative forest policy.

Whereas, favorable agricultural conditions of a country are largely dependent upon a proper amount of well distributed forest areas;

Whereas, the forest statistics of our country show that we are now, with only a population of sixty millions of people, using more wood material than can in continuity yearly be produced on the existing forest areas in their present status and under present methods of utilization;

Whereas, forest property and forestry business, for the purpose of producing valuable building material, is not attractive to private investment, involving large capital, tied up for a lifetime without returns, and exposed to considerable risks of loss, deterioration by fire, and otherwise;

Whereas, therefore, it is apparent that only Government, State, or Nation can have an interest in the proper maintenance of forests for the benefit of future generations, and for the preservation of favorable agricultural conditions;

Whereas, the denudation of mountain slopes and hillsides by fire, and without regard for renewal, has already begun to injure agricultural interest in the Western mountain regions and elsewhere by disturbing favorable distribution of water supply:

Therefore, the undersigned memorialists, imbued solely by a desire to further the best interests of the country at large, and cognizant of the disastrous consequences necessarily involved in a continued policy of unconcern, most respectfully pray that you will, at an early date, give most deliberate consideration to this important interest, and enact such legislation as will tend to avert any anticipated danger.

Your memorialists especially request—

That the timber-lands still in possession of the General Government, mostly situated on the Western mountains, be immediately withdrawn from sale or other disposal;

That these timber-lands be either committed in trust to such of the State governments as have provided in satisfactory manner for the protection of the same and for their conservative management and perpetuity in forest, or else be retained by the General Government and efficiently protected and managed;

That a National Department of Forests be instituted for the protection and management of such forest lands as are retained by the General Government, and for the purpose of assisting, advising, and co-operating with local authorities and individuals in the prosecution and extension of systematic forestry;

That in connection with such a Department of Forests a system of extensive forest-planting be established on the military reservations of the treeless plains for the purpose of directly assisting and encouraging, by example and by plant material, the tree-planters of the plains, and benefiting the agricultural interests of these lands.

THE AMERICAN FORESTRY CONGRESS,
GEO. W. MINIER, President, Minier, Ill.
B. E. FERNOW, Cor. Sec., Washington, D. C.

THE TRAVELERS INSURANCE COMPANY, of Hartford, Conn., has solid cash assets of $8,055,533.39.—*Adv.*

FIXTURES.

DOG SHOWS.

March 8 to 11.—Second Annual Dog Show at Buffalo, N. Y. Geo. H. Chadeayne, Secretary, No. 6 Brown's Building, Buffalo, N. Y. Entries close Feb. 28.

March 22 to 25, 1887.—Spring Show of the New Jersey Kennel Club, Newark, N. J. A. C. Wilmerding, Secretary, 17 Murray street, New York.

March 29 to April 1, 1887.—Inaugural Dog Show of Rhode Island Kennel Club, Providence, R. I. N. Seabury, Secretary, Box 1333, Providence. Entries close March 15.

April 5 to 8, 1887.—Third Annual Dog Show of New England Kennel Club, Boston. F. L. Weston, Secretary, Hotel Boylston, Boston, Mass. Entries close March 19.

April 12 to 15, 1887.—Thirteenth Annual Dog Show of the Western Pennsylvania Poultry Society, at Pittsburgh, Pa. C. B. Elben, Secretary.

April 19 to 22.—Annual Dog Show of the Philadelphia Kennel Kennel Club. E. Comfort, President.

April 26 to 29.—Second Annual Dog Show of the Hartford Kennel Club. A. C. Collins, Secretary, Hartford, Conn.

May 5 to 6, 1887.—Eleventh Annual Dog Show of the Westminster Kennel Club, Madison Square Garden, New York. James Mortimer, Superintendent. Entries close April 18.

FIELD TRIALS.

Nov. 21.—Ninth Annual Field Trials of the Eastern Field Trials Club, at High Point, N. C. W. A. Coster, Secretary, Flatbush, Kings County, N. Y.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **4697.**

ENGLISH SPANIEL CLUB STANDARDS.

[Continued from page 79.]

THE BLACK FIELD SPANIEL.

POSITIVE POINTS.—Head and jaw, 15; eyes, 5; ears, 5; neck, 5; body, 10; forelegs, 10; hindlegs, 10; feet, 10; stern, 10; coat and feather, 10; general appearance, 10—total positive points, 100.

NEGATIVE POINTS.—Light eyes, 10; light nose (fatal), 25; curled ears, 10; curled coat, 10; carriage of stern, 10; topknot (fatal), 25; white on chest, 10—total negative points, 100.

DESCRIPTIVE PARTICULARS.

Head.—Should be quite characteristic of this grand sporting dog, as is that of the bloodhound or bulldog, its very stamp and countenance should at once convey the conviction of high breeding, character and nobility. Skull well developed, with a distinctly elevated occipital tuberosity, which, above all, gives the character alluded to; not too wide across muzzle, long and lean, never snipy nor squarely cut, and in profile curving gradually from nose to throat; lean beneath eyes, a thickness here gives coarseness to the whole head. The great length of muzzle gives surface for the free development of the olfactory nerve, and thus secures the highest possible scenting powers.

Eyes.—Not too full, but not small, receding, or overhung; color, hazel or brown; grave in expression, and bespeaking unusual docility and instinct.

Ears.—Set low down as possible, which greatly adds to the refinement and beauty of the whole head; moderately long and wide, and sufficiently clad with nice setter-like feather. If the ear be well set on, it need not be very long in feather, which is a practical disadvantage.

Neck.—Very strong and muscular, so as to enable the dog to retrieve his game without undue fatigue; not too short, however.

Body (including size and symmetry).—Long and very low, well ribbed up to a good strong loin, straight or slightly arched, never slack; weight, from 30lbs. to 40lbs.

Nose.—Well developed, and with good open nostrils, thoroughly well developed, and always black in color.

Shoulders and Chest.—Former sloping and free—latter deep and well developed; but not too round and wide.

Back and Loin.—Very strong and muscular, and slightly arched; long in proportion to the height of the dog.

Hindquarters.—Very powerful and muscular, wide, and fully developed.

Stern.—Well set on and carried low, if possible below the level of the back, in a perfectly straight line, or with a slight downward inclination; never elevated above the back, and in action always kept low; nicely fringed, with wavy feather of silky texture.

Feet and Legs.—Feet not too small and well protected between the toes with soft feather; good strong pads. Legs straight and immensely boned, strong and short, and nicely feathered, with a flat or waved setter-like feather—feathering below hocks objectionable.

Coat.—Flat or slightly waved, and never curled—sufficiently dense to resist the weather, and not too short—silky in texture, glossy and refined in nature, with neither dulleness on the one hand, nor curl or wireness on the other; on chest, under belly, and behind the legs there should be abundant feather, but never too much, and that of the right sort, namely setter-like. The tail and hindquarters should be similarly adorned.

Color.—Jet black throughout, glossy and true. A little white on chest, though a drawback, not a disqualification.

General Appearance.—That of a sporting dog, capable of learning and doing anything possible for his inches and conformation. A grand combination of beauty and utility.

ANY OTHER VARIETY OF FIELD SPANIEL.

POSITIVE POINTS.—Similar to those given in black variety.

NEGATIVE POINTS.—Subject to color. Similar to those given in black variety.

DESCRIPTIVE PARTICULARS.

Head.—Similar to that of the black spaniel, save in color.

Eyes.—The color in all cases to match the coat and markings, viz.: Black and tans, hazel or brown; liver and tans, rather lighter than in black and tans, but of good rich tone; livers, light hazel color; black tan and white roans, etc., somewhat similar to black and tans; liver and tan roans, etc., somewhat similar to liver and tans.

Ears.—Similar to those of the black spaniel, except in color.

Neck.—Similar to that of the black spaniel.

Body (including size and symmetry).—Similar to that of the black spaniel.

Nose.—Variable, according to color of coat and markings: Black and tans, black; liver and tans, dark liver color; livers, liver; black and tan and white roans, black; liver and tan roans, liver.

Shoulders and Chest.—Similar to those of the black spaniel.

Back and Loin.—Similar to those of the black spaniel.

Hindquarters.—Similar to those of the black spaniel.

Stern.—Similar to those of the black spaniel.

Feet and Legs.—Similar to those of the black spaniel.

Coat.—Similar in quality, substance and texture, and in all other respects, except color, responding to that given for black spaniels.

Colors.—Various, such as black and tan, liver and tan, liver, black, tan and white roans; liver, tan and white roans, etc.

General Appearance.—Similar in all respects, except in regard to color and markings; identical with the general description given before for black spaniels.

THE NORFOLK SPANIEL.

POSITIVE POINTS.—Head, jaw, and eyes, 20; ears, 10; neck, 10; body, 10; forelegs, 10; hindlegs, 10; feet, 5; stern, 5; coat and feather, 10; general appearance, 10—total positive points, 100.

NEGATIVE POINTS.—Carriage of stern, 5; topknot, 5—total negative points, 10.

DESCRIPTIVE PARTICULARS.

Head.—Skull long and rather narrow; a stop; the muzzle long and broad to the end.

Eyes.—Rather small, bright and intelligent.

Ears.—Long, low set and lobular.

Neck.—Long, strong, slightly arched.

Body (including size and symmetry).—Fairly heavy body; legs rather longer than in other field spaniels, but not so long as in Irish. Medium size.

Nose.—Large and soft.

Shoulders and Chest.—Shoulders long and sloping; chest deep and fairly broad.

Back and Loin.—Back flat and strong; loin rather long, flat and strong.

Hindquarters.—Long; hocks well let down; stifles moderately bent, and not twisted inward nor outward.

Stern.—Docked; low carried—*i. e.*, not above the level of the back.

Feet and Legs.—Strong boned legs, inclining to shortness; feet large and rather flat.

Coat.—Hard, not wooly; not curly, but may be broken.

Color.—Liver and white and black and white.

General Appearance.—An active, useful, medium sized dog.

THE BLACK COCKER SPANIEL.

POSITIVE POINTS.—Head and jaw, 10; eyes, 5; ears, 5; neck, 5; body, 15; forelegs, 10; hindlegs, 10; feet, 10; stern, 10; coat and feather, 10; general appearance, 10—total positive points, 100.

NEGATIVE POINTS.—Light eyes (undesirable but not fatal), 10; light nose (fatal), 15; curled ears (very undesirable), 15; curled coat (curly, woolly or wiry), 20; carriage of stern (crooked or twisted), 20; topknot (fatal), 20—total negative points, 100.

DESCRIPTIVE PARTICULARS.

Head.—Not so heavy in proportion and not so high in occiput as in the modern field spaniel, with a nicely developed muzzle or jaw; lean, but not snipy, and yet not so square as in the Clumber or Sussex varieties, but always exhibiting a sufficiently wide and well-developed nose. Forehead perfectly smooth, rising without a too decided stop from muzzle into a comparatively wide and rounded well-developed skull, with plenty of room for brain power.

Eyes.—Full, but not prominent, hazel or brown colored, with a general expression of intelligence and gentleness, though decidedly wide awake, bright and merry, never goggled nor weak, as in the King Charles and Blenheim kinds.

Ears.—Only moderately long, and rather broader than in the large field spaniels, for when too long they are practically a hindrance in dense coverts; and also set rather higher than in the before-mentioned variety, nicely protected with a sufficiency of wavy feather (never curled); indeed this merry and most useful old-world sporting dog should carry only a truly sporting ear.

Neck.—Strong and muscular, and neatly set on to fine sloping shoulders.

Body (including size and symmetry).—Not quite so long and low as in the other breeds of spaniels, more compact and firmly knit together, giving the impression of a concentration of power and untiring activity; the total weight should not exceed 25lbs.

Nose.—Sufficiently wide and well developed to insure the exquisite scenting powers of this breed. Color black.

Shoulders and Chest.—The former sloping and fine, chest deep and well developed, but not too wide and round to interfere with the free action of the forelegs.

Back and Loin.—Immensely strong and compact in proportion to the size and weight of the dog; slightly drooping toward the tail.

Hindquarters.—Wide, well rounded and very muscular, so as to insure untiring action and propelling power under the most trying circumstances of a long day, bad weather, rough ground and dense covert.

Stern.—That most characteristic stamp of blue blood in all the spaniel family, may, in the lighter and more active cocker, although set low down, be allowed a slightly higher carriage than in the other breeds, but never cocked up over, but rather in a line with the back, though the lower its carriage and action the better, and when at work its action should be incessant in this, the brightest and merriest of the whole spaniel family.

Feet and Legs.—The legs must be well boned, feathered and straight, for the tremendous exertions expected from this grand little sporting dog, and should be sufficiently short for concentrated power, but not too short as to interfere with its full activity. Feet firm, round and cat-like, not too large, spreading and loose-jointed. This distinct breed of spaniel does not follow exactly on the lines of the larger field spaniel, either in lengthiness, lowness, or otherwise, but be shorter in back, and rather higher on the legs.

Coat.—Flat or waved, and silky in texture, never wiry, woolly, nor curly, with sufficient feather of the right sort—viz., waved or setter-like, but not too profuse, and never curly.

Color.—Jet black; a white shirt frill should never disqualify; but white feet should not be allowed in any specimen of self-color.

General Appearance.—Confirmatory of all indicated above—viz., a concentration of pure blood and type, sagacity, docility, good temper, affection and activity.

ANY OTHER VARIETY OF COCKER SPANIEL.

POSITIVE POINTS.—Same as in the black variety.

NEGATIVE POINTS.—Subject to color. Similar to those of the black variety.

DESCRIPTIVE PARTICULARS.

Head.—Similar to that of the black cocker.

Eyes.—Dependent on color and markings.

Ears.—Similar to those of the black cocker.

Neck.—Similar to that of the black cocker.

Body (including size and symmetry).—Similar to that of the black cocker.

Nose.—The color will be dependent on color of coat and markings, in all other respects similar to the black cocker.

Shoulders and chest.—Similar to those of the black cocker.

Back and Loin.—Similar to those of the black cocker.

Hindquarters.—Similar in all respects to that described in the black cocker.

Stern.—Identical with that of the black cocker.

Feet and Legs.—Similar to those of the black cocker.

Coat.—Similar in every way to the coat of the black variety, except in color or markings.

Color.—Black and tan, liver and tan, black, tan and white, liver tan and white, lemon and white, roans, and in fact nearly any combination or blending of colors.

General Appearance.—In all respects agreeing with the description given for the black variety of this breed.

NEW ENGLAND KENNEL CLUB.

BOSTON, Feb. 9.—The bench show committee of the club for the coming show in April have already put in some good work, thousands of premium lists and entry forms have been sent out all over the United States, Canada and Great Britain. Congratulations have poured in on the committee for their liberal efforts to bring out the most noted and celebrated dogs in the world.

The entries of some of the most noted dogs in the country have already begun to come in, and the mail received daily at the rooms of the club in Hotel Boylston contain hundreds of requests for additional entry forms, besides new special prizes from the friends of the club, with other matters that assure its success, among which is one from Mr. John E. Thayer, of Lancaster, Mass., who will exhibit for the first time his lately imported fox-terrier Raby Mixer, and will afford his numerous friends a much desired opportunity to see this celebrated dog.

The following additional sweepstakes have been received: The first mastiff sweepstakes for puppies born in the United States or Canada on or after March 1, 1886, for competition among members of the American Mastiff Club, to be decided as follows: 75 per cent. of stakes to first and 25 per cent. to second.

The American Spaniel Club's cocker spaniel sweepstakes, open to members of the Spaniel Club, will be decided as follows: 40 per cent to winner, 30 per cent. to breeder of winner, 20 per cent. to second and 10 per cent. to third, with $10 added by club. HUB.

THE WORCESTER FUR COMPANY.

A VERY large and enthusiastic meeting of the company was held Wednesday evening, Feb. 9, at the store of E. S. Knowles, dealer in sportsmen's supplies.

It should be borne in mind that the company meets nearly every evenidg during the fox-hunting season at the above-named place, and this one differed from the others only in being a regular meeting for the choice of officers and "the transaction of any other business that should properly come before said meeting." It was the same audience that assembles nightly, only larger, and the members were so accustomed to informal talks that it was with some difficulty they were made to realize that they were really in a regular meeting for the transaction of business under parliamentary rules.

"Uncle" Nathan Harrington was in the chair. The first business being the choice of officers for the ensuing year, it was moved and seconded that Uncle Nathan be our president another year. Owing to the extreme modesty of the old gentleman one of the brethren put the motion, which was unanimously carried. E. S. Knowles was nominated for secretary and was also unanimously elected.

The meeting was then open for other business and brother A. B. F. Kinney took the floor and stated that he had important business to present in the form of a very serious charge against a brother member, that he proposed to put the charge in writing and should endeavor to have the paper ready at the next meeting. This announcement threw the meeting into a perfect fever of excitement, about half a dozen members attempting to talk at once, and it was with some difficulty that the venerable president restored order. To the inquiry as to how much time would be required to write out the charge, Mr. Kinney stated that he thought he would be able to have it ready in ten minutes. The idea of waiting could not be entertained and a recess was taken while the document was being drawn up, the time being occupied in lighting fresh cigars and discussing the last fox hunt. When Mr. Kinney came forward to read the "charge" there was perfect silence and a breathless anxiety to catch every word. It was in effect that he was in possession of reliable information that ex-Alderman John R. Thayer had loaned his dogs to a man to kill foxes out of season, *i. e.*, between March 1 and Oct. 1; that the man did kill two young whelps; and furthermore, that if there should be any attempt at denial he would put in the skins as evidence. After reading the charge Mr. Kinney moved that the ex-Alderman be requested to make an explanation to the meeting. The motion was carried and Mr. Thayer took the floor and proceeded to explain that he was obliged to plead both guilty and not guilty. That while he was at church a man did on two successive Sundays in September whistle his dogs away from their kennels and did kill the foxes as charged. He thought, however, that he ought not to suffer for attending church though he was willing to allow that a member should have kept his dogs so secure as to prevent the occurrence a second time.

There was much discussion as to what should be the penalty, and it was finally moved that the company smoke at Mr. Thayer's expense as it was his first offense and not likely to occur again. Mr. Thayer thought the penalty reasonable and proceeded to settle. Adjourned to meet at same place Saturday evening, Feb. 12, at 8 o'clock.

The adjourned meeting of the company was called to order by the secretary in the absence of the president. There being a small attendance the business of the meeting, viz.: to make arrangements for a grand fox hunt to be held before March 1, was postponed and the meeting adjourned to Wednesday evening, Feb. 16, when it is expected there will be a large attendance and the arrangements for the grand hunt will be completed.

It is proposed to have the hunt on the first good day after the arrangements are completed, on which occasion we hope to bring out every member and every dog owned in the company. E. SPRAGUE KNOWLES.

WORCESTER, Mass., Feb. 14, 1887.

HARE DOGS.

PINCONNING, Mich., Feb. 14.—*Editor Forest and Stream:* In your issue of Feb. 10, "Dalg" asks for information in regard to breeding good hare dogs. I find in northern Michigan as much use for good dogs as anywhere. I have ever had the luck to use them and have taken great pains and trouble to get one to perfection, which I think I have in a cross between a pedigreed beagle bitch of medium size and a common Virginia black and tan foxhound of good hunting stock, one that has been used for the last five years every fall and winter. Great care must be taken in training them as the beagle blood makes them a little timid, and a hound is very easily spoiled for the field by being handled wrong from the first. As a rule they do not mind good and are apt to get many whippings when they do not need them. If "Dalg" wants a good hare dog that will stick to the trail I would advise him to learn him to run hare before he knows what a fox or deer track is, and after he has that to perfection let him try the fox, but remember that about three-fourths of the dogs you get are no good and never will be, so do not waste too much time on them, as they will take to it very readily when they are the right age and will enjoy the hunt as much as you do. I often think that the hound is to be pitied as he is kicked and cuffed and called no good when he is not to blame; poor dog, if we could only follow him through swamp and thicket for a day or two, perhaps we would think more of him. Some time I will try and write a story or two on how we hunt in Michigan and what fun we have with our pedigreed stock and mongrel hounds after the buck and doe. A. E. B.

Editor Forest and Stream:

I see in your issue of Feb. 10 a letter from "Dalg" on hare hounds. He wishes to know "why we cannot get reliable hare dogs." I have hunted hares and rabbits for some years and my experience is, that while a pure bred beagle is very good on gray rabbits, his small size debars him from competing with a larger dog on hares. The most of the hunting on hares hereabouts is in thick swamps of cedar, maple and a sprinkling of other growth mixed in. The ground is very rough from the hummocks, caused by the decayed and moss-grown stumps, etc. Here and there is a large deadfall covered with moss, which has lain for years, and a small dog is soon winded by these obstacles. Some hares run very large circles and the average beagle does not bark heavy enough to be heard all the way round the circle. I have seen beagles that did very good work, but for a dog to do a hard day's work with no shirking toward night give me a cross between a beagle and foxhound, both to be good blood of course. I think they make the best and most persistent hound it is possible to get for rabbits. Such a dog should be of medium size, tough, have a good bark; should have well-proportioned head, not too large; good ears, set low down on head. A good square chop is a good sign; tail should be thick and strong—not too short. I think if "Dalg" could see the good old dog work that I have in my mind he would agree with me that it is possible to get good hare dogs. He will account for every gray rabbit he starts and the hare is lucky that escapes. These dogs are easily broken, are docile and obedient and possess good scent. E. W. R.

TAUNTON, Mass., Feb. 12.

NATIONAL FIELD TRIALS CLUB.

[Special to Forest and Stream.]

CINCINNATI, O., Feb. 21.—A meeting of the Executive Committee of the National Field Trials Club was held at the Burnet House today, being in session from 10 A. M. to 4 P. M. Those present were:

T. A. Logan, Chairman; L. A. Harris, F. I. Stone, E. F. Stoddard, J. W. Renfroe. B. M. Stephenson tried and found guilty of conspiracy to pull Ben Hill and expelled from membership of the club. H. S. Bevan found guilty and barred.

Committee appointed to consider the dissolution of National Field Trials Club; to report some future time. American Field Trial Club organized upon entirely new and sound basis; Gen. W. B. Shattuc, President; J. W. Renfroe, 1st Vice-President; T. A. Logan, 2d Vice-President; John S. Wise, 3d Vice-President; C. W. Paris, Secretary and Treasurer.

THE TENNESSEE TRIALS.

THIS is a belated copy of a special that came to the FOREST AND STREAM last Friday. It gives the result of the Tennessee field trials at Athens, Ala.:

"Flake fairly beat Richmond (Spottswood—Fannie). In the Derby, Joy beat Ruby (Spottswood—Dot), Flake a bye; only Joy awarded second. Every heat protested. Counsel retained to prosecute."

LAWRENCEBURG, Tenn., Feb. 19.—Richmond won first in All-Aged Stake; Fanny Whitfield second, Dash Bryson third. Don's Dot first in Derby, Joy of Prince William second, Ruby D. third.

THE BEN HILL—LILLIAN HEAT.—Memphis, Tenn., Feb. 13.—*Editor Forest and Stream:* I, with many others of your readers, thought when you said your columns were open to me to expose the tricks of certain reporters, you meant what you said and really wanted your readers to know why I had made insinuations against reporters. You called on me more than once to explain, and when I did make charges against the editor of ——, all of which I am fully able to prove, you cut it out of my article without giving your readers any intimation whatever that I had written it, thereby changing entirely the tone of my letter. It is not only due to me, but to your readers, that you should publish my article just as I wrote it or return it to me so I may have it published in some other paper.—D. BRYSON. [We asked Mr. Bryson for something that would justify his insinuation that reporters at a field trial must be paid handsomely or else they would give unfair reports. We still call on him for any facts he may have to warrant his insinuations. Mr. Bryson has as yet sent us nothing of the sort. What he did send (and we refused and refuse to publish) was something altogether different and not pertinent to the question at issue. Mr. Bryson alleged that a certain editor having borrowed a sum of money from Mr. P. H. Bryson and having been compelled to repay the loan, out of revenge colored the ——'s report of a certain field trial heat in which one of Mr. P. H. Bryson's dogs ran. Mr. Bryson further alleged that, had this editor not been called upon to pay the money he owed Mr. P. H. Bryson, the same field trial report would have been of an exactly opposite character. Mr. Bryson also intimated that Dr. Young having on a certain occasion threatened to kick this editor or his reporter down-stairs, the threatened kicking also influenced the editor to publish a false report. That the editor borrowed the money, was made to repay it, and did out of revenge publish the report in question, may be true enough, but even so it has no bearing on the case, nor can Mr. Bryson by his illogical involutions make the reporters responsible for the vagaries of money-borrowing editors, or of editors who have been kicked down-stairs.]

MEASUREMENTS OF ALPHA.—Bath, Me., Feb. 5.—*Editor Forest and Stream:* Having purchased of Mr. Haldeman the bitch puppy Alpha, which is undoubtedly the heaviest and most massive on record, I will, for the benefit of the public, give her exact measurements, immediately after her arrival, having been on the road for two days and a half and being in rather poor condition: Length of nose, 3¾in.; girth of muzzle, 13½in.; girth of skull, 22in.; girth of neck, 21¾in.; girth of body behind forearms, 33½in.; girth of loin, 28½in.; girth of stifle joint, 19¾in.; girth below elbow, 10¼in.; girth of forearm, 9½in.; around pastern, 6¾in. This puppy is not for sale.—FRED. A. PAGE.

JUDGES AT NEWARK.—Mr. K. E. Kopf, St. Bernards; Mr. Jacob Hemingway, all spaniels; Messrs. L. and W. Rutherfurd, fox-terriers; Mr. Norman Elmore, beagles and bassets; Mr. J. F. Kirk, Newfoundlands, Great Danes, foxhounds, pugs, dachshunde, bulldogs, bull-terriers, black and tan terriers, Irish terriers, Dandie Dinmonts, Bedlingtons, poodles and miscellaneous class. As Mr. Mercier will not be able to take the collie classes, the Collie Club will make another selection. Messrs. H. Clay Glover of New York, and W. H. Arrowsmith of Jersey City, veterinaries; Mr. Jas Lindsay will superintend.

THE PHILADELPHIA KENNEL CLUB will hold their show in the Elite Rink, at Twenty-third and Chestnut streets, and President Comfort states that it is better adapted for holding a show than the Industrial Art Hall, and that the exhibitors will have no cattle sheds this time.

PREMIUM LISTS.—We are in constant receipt of requests for premium lists and entry blanks of the different dog shows; in many instances on the day on which entries close. If the secretary of any association holding a show will send us copies we will cheerfully distribute them.

KNICKERBOCKER.—*Editor Forest and Stream:* With great sorrow I announce to you the death of my pointer dog Knickerbocker. Being my constant companion for several years on all my shooting trips, I feel his death as one who has lost a dear and devoted friend. Many a day, aside from our regular yearly trips, have he and I, starting long before the break of day, hunted, with but a short intermission for our noonday lunch, until the waning light interrupted our mutual pleasure, and darkness again found us tired but happy wheeling along back to from where we made our early start. Though some days game was scarce and our bag light, and of late years after an all day's hunt his gait was not as elastic as in days of yore, no preparations, were they ever so slight, would fail his notice, and his eagerness would proclaim his anticipations of a day afield. His place I will find hard to fill.—GEO. L. WILMS (Jersey City, Feb. 19).

KENNEL NOTES.

Notes must be sent on prepared blanks, which are furnished free on receipt of stamped and addressed envelope. Sets of 200 of any one form, bound for retaining duplicates, are sent for 30 cents.

NAMES CLAIMED.

☞ **Notes must be sent on the Prepared Blanks.**

Bloodstone, Stickstone, Sandstone, Harry Glencho, Boss Arlington, Fred Arlington, Flora's Baby and Dorcas's Baby. By Geo. F. Pinkham, Central Falls, R. I., for red Irish setters, six dogs and two bitches, whelped Jan. 11, 1887, by Goldstone (Arlington—Flora) out of Dorcas (Glencho—Syren II).

Little Swell. By A. C. Krueger, Wrightsville, Pa., for white, black and tan beagle dog, whelped Dec. 14, 1886, by Cameron's Racket (Rally—Louise) out of Vickey (Racer—Vic).

Mort of Naso. By M. Mills, Jersey City, N. J., for orange and white pointer dog, whelped May 8, 1886, by Nick of Naso (A.K.R. 4388) out of Temptation (A.K.R. 1590).

Brandy. By Harry A. Fletcher, Woodfords, Me., for red Irish setter dog, whelped Sept. 28, 1886, by Prince (A.K.R. 1968) out of Meg Merrilies (A.K.R. 2181).

Peg W. By Harry A. Fletcher, Woodfords, Me., for red Irish setter bitch, whelped Sept. 28, 1886, by Prince (A.K.R. 1968) out of Meg Merrilies (A.K.R. 2181).

Naso Boy. By M. Mills, Jersey City, N. J., for liver and white pointer dog, whelped May 8, 1886, by Nick of Naso (A.K.R. 4388) out of Temptation (A.K.R. 1590).

Bang-Up. By Herbert Flint, Haverhill, Mass., for liver and white pointer dog, whelped June 21, 1885, by Bang (Bang—Vesta) out of Rita Croxteth (Croxteth—Little Nell).

Maud Sarsfield. By Harry A. Fletcher, Woodford, Me., for red Irish setter bitch, whelped Julo 4, 1886, by Sarsfield (Garryowen—Currer Bell II.) out of Maud II. (A.K.R. 986).

Goldnie and Sister. By Mrs. Chas. A. Leonard, for two fawn pug bitches, whelped June 7, 1886, by Joe (Comedy—Clytie) out of Pudge (Young Toby—Titania).

Beau-Naso. By Geo. L. Wilms, Jersey City, N. J., for lemon and white pointer dog, whelped Nov. 26, 1886, by Nick of Naso (Naso II. —Pettigo) out of Polly (Beaufort—Nymph).

BRED.

☞ **Notes must be sent on the Prepared Blanks.**

Krueger's Dot—Cameron's Racket. A. C. Krueger's (Wrightsville, Pa.) beagle bitch Krueger's Dot (Bunnerman—Floss) to his Cameron's Racket (Rally—Louise), Jan. 10.

Marjory—Cameron's Racket. Geo. H. Hill's (Madeira, Ohio) beagle bitch Marjory (Duke—Midget) to A. C. Krueger's Cameron's Racket (Rally—Louise), Jan. 19.

Nell III.—Johnny. F. H. F. Mercer's (Ottawa, Ont.) clumber spaniel bitch Nell III. (Smash II.—Romp II.) to his Johnny (Ben—Joan), Feb. 10.

Nell—Hero III. Victor M. Haldeman's (Milford, Del.) English mastiff bitch Nell (A.K.R. 3647) to his Hero III. (A.K.R. 1765), Feb. 17.

Freckles—Cameron's Racket. E. W. Jester's (St. George's, Del.) beagle bitch Freckles (Duce—Juno) to A. C. Krueger's Cameron's Racket (Rally—Louise), Jan. 23.

Vanity Fair—Naso of Kippen. R. M. Hutchings's (Galveston, Tex.) pointer bitch Vanity Fair (Bang Bang—Bellona) to Westminster Kennel Club's Naso of Kippen (Naso II.—Maggie), Feb. 5.

Lalla Rookh—Bang Bang. Luke W. White's (Mahwah, N. J.) pointer bitch Lalla Rookh to Westminster Kennel Club's Bang Bang (Price's Bang—Princess Kate), Feb. 3.

Yum Yum—Naso of Kippen. Paul Francke's (St. Joseph, Mo.) pointer bitch Yum Yum (A.K.S.B. 4252) to Westminster Kennel Club's Naso of Kippen (Naso II.—Maggie), Feb. 16.

Happy Medium—Naso of Kippen. F. R. Hitchcock's (New York city) pointer bitch Happy Medium (Croxteth—Fan Fan) to Westminster Kennel Club's Naso of Kippen (Naso II.—Maggie), Feb. 19.

Modesty—Bang Bang. F. R. Hitchcock's (New York city) pointer bitch Modesty (Croxteth—Trinket) to Westminster Kennel Club's Bang Bang (Price's Bang—Princess Kate), Feb. 20.

Brunette—Turk III. Chas. E. Bann's (Peoria, Ill.) mastiff bitch Brunette (A.K.R. 3549) to La Fayette Cole's Turk III. (A.K.R. 4049), Feb. 11.

WHELPS.

☞ **Notes must be sent on the Prepared Blanks.**

Belle. A. C. Krueger's (Wrightsville, Pa.) beagle bitch Belle (Jock—Pigeon), Jan. 13, six (three dogs), by his Cameron's Racket (Rally—Louise).

Edith. C. E. Gilchrist's (Charlestown, Mass.) cocker spaniel bitch Edith (Brush II.—Olivia), Feb. 13, seven (four dogs), by F. H. Perrin's Shady (Obo II.—Darkie).

SALES.

☞ **Notes must be sent on the Prepared Blanks.**

Krueger's Myrtle. White, black and tan beagle bitch, whelped April 6, 1882, by Minstrel out of Handmaid, by A. C. Krueger, Wrightsville, Pa., to Mrs. C. E. White, Cleveland, Ohio.

Bunnerman. White and lemon beagle dog, whelped November, 1882, by Marchboy out of Dewdrop, by A. C. Krueger, Wrightsville, Pa., to F. T. Lane, Glencoe, Ill.

Bang Bang—Kerry whelp. Lemon and white pointer dog, whelped Oct. 16, 1886, by T. F. Rivers, Bridgeport, Conn., to A. J. Klofanda, Eau Claire, Wis.

Brandy. Red Irish setter dog, whelped Sept. 28, 1886, by Prince (A.K.R. 1968) out of Meg Merrilies (A.K.R. 2181), by Harry A. Fletcher, Woodfords, Me., to William E. Ramsay, Saginaw, Mich.

Belfast. Red Irish setter dog, whelped March 22, 1886, by Prince (A.K.R. 1968) out of Meg Merrilies (A.K.R. 2181), by Harry A. Fletcher, Woodfords, Me., to Arthur K. Hunt, Portland, Me.

Prince (A.K.R. 1968)—Meg Merrilies (A.K.R. 2181) whelp. Dark red Irish setter dog, whelped Sept. 28, 1886, by Harry A. Fletcher, Woodfords, Me., to Israel Potter, Cranston, R. I.

Prince (A.K.R. 1968)—Meg Merrilies (A.K.R. 2181) whelp. Red Irish setter dog, whelped Sept. 28, 1886, by Harry A. Fletcher, Woodfords, Me., to L. A. Van Zandt, Yonkers, N. Y.

Peg W. Dark red Irish setter bitch, whelped Sept. 28, 1886, by Prince (A.K.R. 1968) out of Meg Merrilies (A.K.R. 2181), by Harry A. Fletcher, Woodfords, Me., to Charles A. Worden, Allenton, R. I.

Happy Obo. Black cocker spaniel dog, whelped Aug. 24, 1885, by Obo II. out of Althea (A.K.R. 842), by Harry D. Brown, Waterbury, Vt., to Dr. W. S. Webb, Burlington, Vt.

Maud Sarsfield. Red Irish setter bitch, whelped July 4, 1886, by Sarsfield out of Maud II., by J. C. Lester, Parkville, Conn., to Harry A. Fletcher, Woodfords, Me.

Maud Wind'em. Blue belton Llewellin bitch, whelped July 15, 1886, by Rex Gladstone out of Countess Wind'em, by G. F. Clark, St. George's, Del., to W. P. Dichl, Necodah, Wis.

Rex Gladstone. Blue belton setter dog, whelped Sept. 12, 1882 (A.K.R. 2167), by G. F. Clark, St. George's, Del., to W. A. Poland, Trenton, N. J.

Prince (A.K.R. 1968)—Meg Merrilies (A.K.R. 2181) whelp. Red Irish setter bitch, whelped Sept. 28, 1886, by Harry A. Fletcher, Woodfords, Me., to B. E. King, Belvidere, Ill.

Prince (A.K.R. 1968)—Meg Merrilies (A.K.R. 2181) whelp. Red Irish setter bitch, whelped Sept. 28, 1886, by Harry A. Fletcher, Woodfords, Me., to L. A. Van Zandt, Yonkers, N. Y.

Jubilee. Black, white and tan collie dog, whelped June 4, 1886, by Heather out of Madge, by McEwen & Gibson, Byron, Ont., to I. D. Carpenter, Bozeman, Mon.

Iron Duke (A.K.R. 2633)—Trusty Gladstone (A.K.R. 1550) whelps. Three blue belton dogs and one bitch and one blue belton with tan markings, bitch, whelped Dec. 25, 1886, by George Jarvis, New York city, one each to E. Halpin, White Plains, N. Y., W. F. Streter, Lehigh Tannery, Pa.; C. Sherwood, New York city, and two to C. F. Snell, Danbury, Conn.

Foreman and Plantagenet. By W. A. Tallman to C. F. Crawford, of Pawtucket. They will still be shown by the Blackstone Kennels, in which Messrs. Tallman and Crawford are interested.

IMPORTATIONS.

Royal Albert. Blue belton English setter dog, whelped January, 1884, by Sir Alister out of Novelty, by C. Fred Crawford, Pawtucket, R. I., from J. Shorthose, Newcastle-on-Tyne, England. Royal Albert has won one second, three firsts and two specials for best setter in show.

Lucifer and Media. Fox-terriers Lucifer (Splinter—Kohinor), Media (Tackler—Lady Disdain). By Mr. August Belmont, Jr.

DEATHS.

Knickerbocker. Liver and white pointer dog (A.K.R. 19), owned by Geo. L. Wilms, Jersey City, N. J., Feb. 14.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

S. C. C., Marietta, Ga.—A collie bitch about five years old has always been in perfect health. About a week ago I observed that she kept her eyes nearly closed and rubbed them with her paws as if distressed. No fever apparent, and her appetite has not failed. I washed her head with warm water, nothing more, and the trouble rather increases. Can you tell me what ails the bitch and what to do for her? Ans. Keep her bowels free with syrup of buckthorn or salts. Wash with weak solution of alum or sulphate of zinc or copper, one grain to the ounce of water. As a tonic and alterative nothing is better than Fowler's solution of arsenic, five drops night and morning.

Rifle and Tray Shooting.

Address all communications to the Forest and Stream Pub. Co.

MILITIA RIFLE PRACTICE.

THE reports made by experienced army officers on the several State camps of National Guardsmen held during the past summer, make very interesting reading, as much in what they find to praise as in what they find to criticise. In the matter of rifle practice the great majority, too great indeed, of the reports tell of obsolete arms, of arms in bad condition and of practice almost at a standstill. The officers speak to the point, and the following extracts from the report to the Adjutant-General tell the whole story. The location of the several camps and the officer making the report is shown in the following assignment of stations:

Alabama.—At Mobile and Selma, by Capt. R. G. Howell, Second U. S. Art.

Connecticut.—At Niantic, by First Lieut. C. A. L. Totten, Fourth U. S. Art.

Dakota.—At Aberdeen, by Lieut. E. F. Townsend, Eleventh U. S. Inf.

Illinois.—At Springfield, by Capt. G. Lawson, Twenty-fifth U. S. Inf.

Indiana.—At La Fayette, by Maj. R. Lodor, Third U. S. Art.

Iowa.—At Oskaloosa and Marshalltown, by Col. R. I. Dodge, Eleventh U. S. Inf.

Kansas.—At Fort Riley reservation, by Lieut.-Col. C. E. Compton, Fifth U. S. Cav.

Kentucky.—At Crab Orchard Springs, by Capt. J. L. Tiernon, Third U. S. Art.

Maine.—At Bangor, by Capt. E. Field, Fourth U. S. Art.

Massachusetts.—At South Framingham, Hingham and Essex, by Capt. C. B. Rodney, Fourth U. S. Art.

Michigan.—At Island Lake, by Maj. A. C. M. Pennington, Fourth U. S. Art.

Minnesota.—At New Ulm and at White Bear Lake, by Maj. J. M. Bacon, Seventh U. S. Cav.

Missouri.—At Sweet Springs, by Capt. T. Schwan, Eleventh U.S. Inf.

New Hampshire.—At Concord, by Lieut.-Col. H. W. Closson, Fifth U. S. Art.

New York.—At Peekskill, by Maj. R. H. Jackson, Fifth U. S. Art.

Ohio.—At Washington Court House, Springfield, Mount Vernon, and Sandusky, by First Lieut. A. P. Blockson, Sixth U. S. Cav.

Pennsylvania.—At the various regimental encampments, by Maj. W. J. Volkmar, Asst. Adj.-Gen.

Rhode Island.—At the State camp ground, by Col. C. L. Best, Fourth U. S. Art.

Vermont.—At Burlington, by First Lieut. W. H. Coffin, Fifth U. S. Art.

Alabama.

In addition to the 170 muskets in camp, the colonel informed me that he had a reserve of about forty. These latter, however, were mostly in an unserviceable condition. A majority of those in camp were in serviceable condition, though nearly all of them evinced a great lack of care. Probably fifty of them were almost totally unserviceable from neglect. Out of probably a dozen that I examined in one company there was not a single gun that I would not anticipate unfortunate results from in case it was fired and this in consequence, principally, of the guns being eaten up with rust.

From the Selma camp Captain Howell reports:

"The command is armed with the Springfield rifle, and in general the guns are in pretty fair condition for service, though nearly all are suffering from rust and a large proportion are deteriorating rapidly from this cause. A general indifference on this point is obvious. Each company has in its possession 1,000 rounds ball-cartridges, which are kept constantly on hand for actual service. The companies, with a few exceptions, are quite well drilled in the school of the soldier and company. But little attention, however, has been paid to skirmish drill and target practice. During the encampment, however, target firing was carried on daily in a systematic and most creditable manner. The method practiced in the United States Army was adhered to."

Connecticut.

Besides the small arms in the hands of the brigade, the State owns, in store at its arsenal, 248 Peabody and 327 Springfield breechloaders, caliber .45. One regiment in camp was armed with Springfields, the other troops carrying Peabody guns. The arms were in good but not in excellent condition. They are only cared for by regular armorers. This is probably necessary in the National Guard, as the arms are necessarily left at the armories. Under existing circumstances, however, a soldier can hardly feel a special pride in his own weapon, and understands but little of its care. All this changes in protracted active service and will right itself. I only saw the arms used with blank cartridges, and was surprised to find that at least 10 per cent. of the shells stuck so badly in the Peabody arm that they had to be extracted with the ramrods. Three or four stuck in this way after every discharge in several of the companies behind which I was standing during drill, and had they been ball cartridges in action the men would, in these days of wonderful arms, been demoralized. I examined these shells and found them so peculiarly crimped that they split almost invariably and anchored themselves.

The State keeps 100,000 rounds of ball cartridges for the small arms constantly on hand at its arsenal, and probably had sufficient for an emergency in the camp. It used blank ammunition very freely during the encampment, but not wastefully.

There is no range at the State reservation, and no ball cartridges were issued or used. All target practice takes place at home, each town where there are companies of the National Guard being required by State law to provide a suitable range for practice. This practice receives about as much attention as in other States, and excites no little interest. Thirty-five shots per season are allowed within which to qualify, and accurate annual reports thereon are made by the inspectors of rifle practice, which are incorporated into the State Adjutant-General's report.

Dakota.

The arms are the Springfield rifle musket, model 1866, caliber .50. They were in a fair condition, with the exception of a slight looseness at the hinge-pin and the lock-screws. This last may be due to the shrinkage of the stock. There was no target practice during the encampment, neither could I learn that any had been had by any of the companies, with the possible exception of one. Company A, First Regiment, has had a few practices during the past year, and have qualified a few marksmen. If any other company had any I did not hear of it.

Illinois.

All the infantry are armed with the Springfield rifle, caliber .45; but they are not all provided with the safety notch. The cavalry are armed with the Springfield carbine, caliber .45. Considerable interest was taken in target practice—distances fired, 100, 200, 500 and 500yds. Lieut.-Col. Thomas C. Clark, inspector of rifle practice of the brigade, had charge, assisted by the inspector of each regiment. On the north side of grounds is located one of the best target ranges, from 100 to 1,000yds., I have ever seen. Great credit is due to the officer, Col. J. A. Shafer, general inspector of rifle practice, who personally superintended the work, for so promptly getting the grounds in condition for the encampment. Shelter was provided for the markers, and many other minor details were looked after and provided which would be well if we had on the Army ranges.

Target practice was under the supervision of Lieut.-Col. James M. Rice, inspector of rifle practice of the brigade. A more zealous and painstaking officer could not have been selected. On the range there were seventeen "Laidley" revolving targets. Markers were hired for the occasion, and communication by telephone was kept up between the firing point and the markers.

A battalion of four companies occupied the range; four in the forenoon and four in the afternoon, each under command of a field officer, assisted by the regimental inspector of rifle practice of the regiment to which the troops belonged. Great interest was taken in this matter from the commanding general down.

The following rules determined the classification: Those who make 60 per cent. in one score of 5 shots at 100, 200 and 500yds. are classified as marksmen; those who make 60 per cent. in one score of 5 shots at 100 and 200yds. are classified as first class; those who make 60 per cent. in one score of 5 shots at 100yds. constitute the second class; those who have had practice during the "target season," July 1 to Nov. 1, at 100yds., are as third class; and all officers and men, whether present or absent, who fail to practice during the "target season" are put in the fourth class.

The following is the figure of merit of the regiments in this command: General and staff, 26; Fifth Infantry, 30.60; Sixth Infantry, 32.48; Eighth Infantry, 34.79. Figure of merit for the brigade of 32.04 against 21.41 for the year 1885.

Last year (1885) this command had 113 marksmen; this year (1886) they have 195. This shows great progress, and can still be increased by a little more attention to aiming drills and gallery practice.

Indiana.

Of the United States breechloading rifle musket, caliber .45, and in all cases serviceable. Their condition showed me that considerable care was manifested in keeping them in order. After the sham battle I found but few pieces that had not been properly cleaned.

Iowa.

All the Iowa National Guard is well armed with the Springfield rifle. About half the companies have the .50-cal. (some the old bright barrel); the other half have the more recent .45-cal. These arms are generally in good condition and seem to be well cared for. At present, however, companies of the same regiment have arms of different caliber—a condition likely to lead to mistake and disaster. It would be far better could the whole force of the State have arms of the same caliber. If this is not practicable, such transfers of arms should be made as will result in each regiment having the same caliber for all it companies.

There is no attempt at target practice as it is understood in the United States Army. The State allowance to each company is but one thousand cartridges a year, which, if distributed among all the enlisted men, would give each but two or three shots in the year. Recognizing the uselessness of this practice, the present custom is to make up teams of six men from each company on the principle of the "old time" shooting matches, the men known to be the best shots being selected for the teams. During the encampment these teams shoot in competition with each other, the team making the best score winning a prize.

The company allowance of cartrides is expended in preliminary practice and in the final contest by these teams, the consequence being that the only "target practice" is had by those men of each company who least need it. The large majority of the men get no practice whatever. I recommend that this mode of practice be discontinued (if no more cartridges can be issued), and that in lieu of the present allowance of ball cartridges an equal amount of money be expended on blank cartridges to be used in volley and file firing, to inure the men to flash and recoil.

Kansas.

The troops are armed with the Springfield rifle, furnished by the United States upon requisition by the State authorities. The command had no target practice at the encampment. The commanding officer of Fort Riley offered the use of movable targets for service in the camp and the freedom of the rifle range of the post, but no time could be spared to be devoted to this exercise.

Kentucky.

The arms in use are the Springfield rifles, caliber .45, model 1873, and, with few exceptions, are in good condition; the accouterments are in good order. No rifle practice in camp.

Maine.

Target practice was the most important feature of the Maine encampment, and a marked contrast to most State encampments, where this part of a soldier's duty is apt to be done in a very perfunctory and lifeless manner.

The inspector of rifle practice is Col. E. Farrington, probably the best inspector in the New England States; judging by the results attained, should say one of the best in America, for any one who has had much knowledge of the militia knows under what disadvantages and discouragement rifle practice is carried on. There is almost an inevitable conflict between the inspector and company and regimental commanders. So much is to be done in so little time that the man who is zealous in drill and tactical exercise naturally grudges the time devoted to something, which, however valuable and necessary, does nothing toward attaining that military bearing and proficiency by which largely the ability of captains and colonels must be judged by the critic and by the public at large.

The first contest that I witnessed was on Wednesday morning, and was what is known as the company skirmish match, conditions not less than 25 men to compete; distance 250 to 100yds., unknown to companies; rounds 10 (5 advancing and 5 retreating); to halt and fire at the whistle, off-hand, one shot at each halt. Twelve companies competed, with the result given below. The men were formed at such interval as the size of the company would admit, from 3 to 6yds.; the command "advance" was given, then a signal from the whistle, a halt, and one shot fired; then the signal to advance, and so on up to near the 100yds. limit; then retreat, with halts as above. I was struck with the admirable practical discipline enforced and shown in this exercise; the skirmish line was well preserved and aligned, both in advance and retreat; not a single man fired before the proper time; there was not a musket fired before being carefully aimed; not the faintest indication of haste or flurry; and not the smallest accident of any kind. As will be seen by an examination of the table, the average was very good. Not a single company did badly, considering their very limited opportunity for practice compared with time devoted in our own service.

Four companies made over 350 points, that is, over 200 hits out of 250 shots, while the work done by the Eastport company is, I think, very remarkable—out of 250 shots 233 hits, 2 miss fires, 4 shots lost; so that the actual score fired was 233 hits, 21 misses. This company deserves special mention, being composed of the very best material in the town, which enjoys the distinction of being the most easterly settlement in the United States. Almost every man in the company is a crack shot; almost every profession in the town is represented—lawyers, physicians, business men. Their pride in the organization and *esprit* is so strong that in steadiness, sobriety, quick and cheerful obedience they might be well taken as a typical representation of the best elements of American manhood. I append the tabulated score, 10 shots per man, 5 advancing and 5 retreating, third class target; distance 250 to 100yds., unknown:

Organization.	Men	Bulls	Cen-ters	In-ners	Out-ers	Hits	Score
Co C, First Reg.	27	13	42	49	52	156	484
Co F, First Reg.	35	11	45	50	61	167	487
Co G, First Reg.	35	17	95	106	75	293	933
Co H, First Reg.	29	5	50	44	46	125	369
Co A, Second Reg	37	9	64	72	81	226	679
Co B, Second Reg.	36	13	70	68	57	208	663
Co C, Second Reg.	36	21	104	88	72	285	929
Co D, Second Reg.	31	13	89	103	93	298	916
Co E, Second Reg.	35	20	102	86	53	261	872
Co G, Second Reg.	38	5	39	50	34	128	395
Co H, Second Reg.	31	9	23	43	57	132	380
Frontier Guards, Eastport	36	16	151	121	45	333	1167

The next match was 50 men from each regiment, taken from different companies, distances 400 to 100yds., unknown; rounds 20, 10 advancing and 10 retreating; second class target. In this match the men were more crowded and the number of shots twice as great; distance nearly double. The same admirable order and discipline prevailed. Owing to the fact that the first 80yds. was in a field filled with stumps, and separated from the target by a high rail fence, the first three rounds advancing and the last three retreating had to be fired from the shoulder; that is to say at the very longest distances. What was very noticeable was the admirable instruction shown on the part of officers. The sights were only changed once; all the shots within these two elevations were aimed by allowance; and at each halt you would hear the officers' instructions, so much "below the bullseye," "just below the 4-ring, etc. By inspecting the table it will be seen that only 201 bullets in the First regiment and 142 in the second failed to hit the

target out of 1,000 shots; the inners outnumber outers and centers outnumber inners:

Organization.	Men.	Bulls.	Centers.	Inners.	Outers.	Hits.	Score.
Second regiment	50	230	290	214	118	858	3,218
First regiment	50	180	278	314	119	799	2,932

This days' shooting concluded with an exhibition match, made up on the ground, 100 men from the brigade, conditions the same as in the regimental match. In this contest the men were so crowded that it was practically a line of battle. The fact that with at least four or five different positions assumed there was not a premature discharge or the smallest accident speaks volumes for the practical discipline which could bring out such results. Just before the 100yds. limit was reached the target was so shot away that the dirt falling through from the butt brought it to the ground and a new one had to be substituted, a fortunate occurrence, as otherwise the bullseye and center would have been practically obliterated, and a count would have been impossible. Many of the spectators were veterans of the war, and they agreed that the fire from these 100 men would have annihilated any 1,000 men that either side could have produced during the war; that in such a fire Ricketts' Division could not have got half way across the open ground. My experience in skirmish firing is very small, as we have been unfortunate in having no range for the past five years, but it struck me as being quite marvelous, and as justifying in itself the existence of the Maine militia.

On Thursday morning was the regimental team match; five men from each regiment; ten rounds each, five at 200 and five at 500yds., as follows: First regiment team, 200yds., 91, and 500yds., 88—total 179; Second regiment team, 200yds., 84, and 500yds., 88—total, 172. The day was hot and the men tired. There were no flags or means of estimating force and direction of the wind, which was high.

In regard to habitual practice, all of the companies in the Second regiment, except F, have target practice constantly and regularly. More attention is paid to skirmishing than to known distances, or, rather, more time devoted. In the First regiment four companies have regular and constant practice; the others pay little attention, being in the cities where the facilities for constant practice are wanting, and every incentive is present to the company commander to devote all time possible to drill and appearance.

Massachusetts.

The arms (Springfield rifle, caliber .45) and equipments are no longer inspected in camp, experience showing that this work can be more thoroughly performed in the armories. Target practice received considerable attention, and both brigades have a fair proportion of marksmen. The State compels a certain amount of practice when practicable, and makes a fair allowance of ammunition, but this allowance shoud be increased.

Michigan.

The arms in the hands of the troops are Sharp's and Springfield rifles, caliber .45, the former being largely in excess of the latter. Out of 38 companies only 8 are supplied with Springfield rifles. The Springfield rifles are in perfectly serviceable condition. The Sharp's rifles have been in the hands of the troops for many years, and should be replaced by the Springfield as rapidly as the exchange can be effected. They are not generally in good, serviceable condition; the bayonets are not interchangeable, the exterior diameter of the muzzles varying. The mechanism is too complicated. There was a complaint that many of them would not explode the cartridges. On the morning that I inspected the command these arms were generally rusty and in bad order. These arms are cared for in the armories by armorers, and in camp the men are not supplied with the means for cleaning them. In each of the regiments, however, I noticed companies in which all the members had cleaned their arms. The Sharp's rifle having no hammer, the troops cannot bring their arms to the "support arms" prescribed in the tactics, but use the "carry arms" of Scott's tactics. This produces a want of uniformity. No target practice was held in camp. I believe some attention is paid to it at home stations, but as far as I can learn it is not pursued methodically. The expenses attending rifle practice in 1885-'4 was $3,172.60 for the two years.

Minnesota.

The infantry were armed with Springfield breechloading rifles, caliber .45, except the Luverne Guards (armed with the obsolete Springfield breechloading rifle, caliber .50). A large number of the rifles have been supplied with the last improved sights, and there were many old guns without the safety notch and badly worn, which should be exchanged for serviceable rifles.

The calvalry were well armed with the Springfield breechloading carbine. The range for target practice at 100, 200, 300 and 500yds. was very good. Practice was had under the supervision of the inspector of rifle practice, First Lieut. E. W. Bird, according to regulations promulgated by the Adjutant-General's office of the State of Minnesota. Much interest in the subject was manifested, and as high a state of excellence attained as possible in a single practice week; the conditions differing from those laid down in Blunt's Rifle and Carbine Firing, no comparison could be made between the shooting of these troops and those of the Army.

In addition to the above report from Camp Hubbard, Major Bacon speaks as follows of the camp at White Bear Lake: "The rifle range, though the best that could be obtained in the neighborhood, was over a marsh and not good. The practice was conducted by the regimental inspector of rifle practice, First Lieut. C. M. Skinner, being at the same distances and under the same rules as those governing Camp Hubbard. Officers and men evinced a commendable zeal in this duty, and made a most creditable record."

Missouri.

The troops were all armed with the Springfield rifle, caliber .45, without safety notch, and having the old sight. Though serviceable, the rifles were not, as a rule, in good condition, barrels and rear sights being more or less rusty, stocks battered, and generally showing rough usage. In many cases the fouling of the bores from the previous days' firing had not been removed. To the general neglect noticeable in this respect the rear company of the Second Infantry constituted a notable exception. No target practice was had during the camp period.

New Hampshire.

The infantry was armed with the Springfield rifle, caliber .45, in good condition. There was some skirmish drill but no target practice, and no blank cartridge practice. Skirmishing and the fire exercise are, I think, of the utmost importance, and might well monopolize the time to the exclusion of more dramatic exhibits. There is some difficulty in securing ranges at the company armories and vicinity, and the scant State appropriation, from twenty to twenty-five thousand dollars yearly, limits the ammunition supply. General orders, Nos. 1 and 4, this year's date, show that a beginning has been made in the matter of target practice from which good results may be expected.

New York.

There was no target practice at the camp this year. The Adjutant-General of the State, who was also the commanding officer, informed me that it had been determined at Albany that the regiments and separate companies should practice at the home ranges so as not to interfere with the practical instruction in drills and recitations at the camp. The New York and Brooklyn regiments have their range at Creedmoor and the other regiments and companies have target ranges of their own.

Ohio.

The infantry is armed with Springfield rifles, caliber .45, regulation belts; McKeever cartridge boxes, etc. Nearly all these rifles have been in service nine or ten years, are much battered, and not kept in good order by the men. A few of the latter patterns have been in use for a year or two and are in good condition. The Adjutant-General informs me that he is going to send all the old rifles to Government arsenals as soon after the encampment as practicable, to be thoroughly repaired, refitted with improved sights, etc. The State has altogether, in use and in armories, 6,228 rifles. There is on hand about 135,000 rounds of rifle ball-cartridges and about 500 rounds of shot and shell for field-guns, most of this being at the Columbus Arsenal. No infantry target practice was had.

Pennsylvania.

Referring to such of my report last year upon the National Guard of Pennsylvania as relates to their wretched supply of arms and ammunition, I most earnestly renew my recommendations then made. Interest in a soldier's weapons cannot be very great when he knows that they are inferior, obsolete, and almost absolutely worthless. The day may not be distant when these troops will be called upon suddenly for most important State or national service, and the deplorable effect upon the *morale* of the men caused by the miserable arms and ammunition in their hands is not to be estimated. If would seem well, then, if an earnest, united effort was made by the national guards of all the States to secure passage by Congress of some one of the several bills already introduced in that body providing for exchange by the National Government of worn out or obsolete arms now in the hands of the militia.

Rhode Island.

The infantry portion of the brigade is lamentably deficient in the most important duty of target practice. That is conceded on all sides. Last year 360 men had a practice on the State range of 10 shots each (quite too few), when an accident (killing a cow, I believe) occurred, and practice was suspended. Thus far this year there has been no practice at all, from insecurity of the range or want of appropriation. Pity 'tis, for with such ignorance of the use and capabilities of his weapon as must be the case under such circumstances, the soldier is illy prepared for a call to active duty in the field.

Vermont.

I consider the arms and accouterments unserviceable and very discouraging to the men into whose hands they are put. The rifle with which they are armed is the Springfield breechloader, caliber .50, and has been in use by these troops some twelve years. Many of these pieces are without sights; the majority of them have some defect in the mechanism of the locks or breech-block, or both; many cannot be fired at all; and, as a whole, they might be considered as almost useless, or at least unreliable. Most of them are so rusty and fouled that I doubt if any of them could be fired with effect. Proper care does not seem to have been taken of them, but it must be said they have been long in use, are old and out of date, and the men do not take that pride in them which I am satisfied they would do were a more modern and better weapon placed in their hands. But little attention is paid to target practice. The facilities for a range are, with most of the companies, excellent, but the inferiority of the rifle, the difficulty in obtaining ammunition, and the absence of any provision for assembling the companies for such practice are discouraging in the extreme, and many of the companies have had none at all, and what little has been had by the others has been unsatisfactory. There were no facilities for target practice in camp, and it would be difficult to find a suitable range for such practice on the average ground selected each year for the encampment. Were a permanent camping ground established a rifle range could be fitted up and the usual facilities for practice during the encampment had.

RANGE AND GALLERY.

ZETTLER VS. NEW YORK.—These two crack clubs put their first teams in competition at the Zettler gallery on Friday evening last and a remarkably fine score was made by the winning Zettlers. Secretary Shepherd had his glasses so dimmed by the hot air of the gallery that he was compelled to discard them and his score suffered thereby. Case was a sick man and out of condition. The other scors speak for themselves as follows, 30yds., off-hand:

Zettler Team.		New York Team.	
M Dorrler	5555555555—50	A Howlett	5544555555—48
L Flack	5555444444—44	M Herrington	4554455544—45
Jos Wilger	5555454555—48	J S Case	4545434343—39
M Engel	5455555554—48	Thos Dolan	5445555544—47
H Walther	5555455555—49	T Mahoney	5454545444—44
V Stembach	5554555555—49	J S Shepherd	4444452444—39
M L Riggs	5554555545—48	N O Donnelly	4554544545—45
B Zettler	5445555544—46	E Edgar	5454445554—45
C Zettler	5455445445—44	C E Taintor	4555555556—49
A Lober	5555454545—47	L V Sone	4555555555—49
Aggregate	473	Aggregate	450
Average	47 5-10	Ave age	45

The target used in the match was the Overbaugh gallery diagram with a bull 1¼in. diameter and a center 3¼in. diameter. A return match will be shot and the second team of the Zettlers will try and beat the senior record.

BOSTON, Feb. 16.—The attendance at the range at Walnut Hill to-day was fair; a variable wind prevailed. J. Francis made two clean scores of 100 in the rest, and Mr. Cushing an 89 and Mr. Charles an 86 in the off-hand match. Matches C and F will close with the shoot of the 22d inst. Below are the records at 200yds. to-day:

Decimal Match.

H Cushing, C	8	10	10	9	10	10	7	6	9	10—	89
W Charles, C	9	7	8	10	6	10	10	10	7	9—	86

Pistol Match at 100ft.

J Francis	40	40	43	00
A C Gordon	40	40	40	49
J N Frye	40	39	39	00

BOSTON, Feb. 19.—The riflemen had a very enjoyable time at their range at Walnut Hill to-day. The attendance was large, but the weather conditions were not favorable, a high wind blowing. A team match was shot during the day between the members of the Massachusetts rifle team who were present, which was won by Capt. Fellows' team, which led by one point.

Team Match—200yds., Capt. Fellows' team:

J B Fellows	8	10	9	6	8	9	9	8	8	—84
C E Berry	10	9	9	6	6	9	10	6	5	9 —79
F Carter (mil)	8	5	6	5	4	7	9	5	7	6—82+5—87
D L Chase	4	7	7	7	4	8	6	6	5	7 —61
W Gardner	0	9	5	5	8	5	6	6	5	8 —58—349

Capt. Charles' team:

W Charles	7	8	10	8	6	9	8	10	4	10 —84
A L Brackett (mil)	6	6	10	5	6	9	5	6	7	7—67+5—72
H J Foster	4	6	6	8	6	9	6	6	10	6 —68
J N Frye	5	6	5	7	8	8	5	4	5	7 —62
J A Cobb	7	7	5	7	3	5	7	9	8	4 —62—348

Decimal Off-Hand Match—200yds.

BOSTON GALLERY SCORES.—There was a lively tussle all last week at the Mammoth Rifle Gallery in the various matches. The "special match" has attracted great attention, and the score of Mr. Eastman is certainly wonderful. The records in all the matches are appended:

Special Match.

C H Eastman	100	99	99	98	97	97	97	97	95	95—	974
W Wilder	98	98	97	97	96	96	96	96	96	96—	966
J Felix	98	97	97	97	96	96	95	95	95	95—	961
H R Bradley	96	95	95	94	93	93	93	92	91	90—	932

Decimal Rest Match.

C H Eastman	98	98	98	98	97	96	96	96	96	96—	969
B W White	95	93	93	91	90	87	89	85	85	82—	857

Decimal Off-Hand.

W Henry	93	90	89	89	88	87	86	86	85	85—	878
J Felix	89	87	86	86	86	86	85	84	84	84—	857

Amateurs' Match.

J Hunt	48	48	45	44	44	44	44	44	43	43—	448

C O Ming	90	90	89	88	88	87	86	86	86	86—	875

NEW ORLEANS, Feb. 17.—The following is the score made during the week at S. J. Clinton's gallery, 50yds., possible score 168:

E B Colton	165	James White	162
A B Rice	164	A O Guillott	161
E W Marlbourgh	163	E R Stone	160
G C C Capell	162	Dr Tammen	160
P A Duprey	162	Geo Wilson	160

Pistol match, 15 paces, possible 60:

Pirtit Proctor	60	James White	59
E B Colton	60	E R Stone	58
D B Rice	59		

WILMINGTON, Del., Feb. 14.—The weekly shooting of the Wilmington Rifle Club took place at Schuetzen Park this afternoon. The scores are as follows out of a possible 100 points on Standard American target:

At 200yds.										
R Miller	6	8	7	7	6	8	7	6	7	6—68
W F Seeds	4	4	5	5	4	9	8	7	9	6—61
J E Newman	2	2	3	5	7	7	6	9	4	2—47
W A Bacon	4	3	4	5	6	2	5	6	5	6—46
H Simpson	2	1	2	6	6	7	5	4	8	4—40
W O'Connor	7	4	5	3	3	1	3	2	6	5—39
C Frederick (mil)	0	1	4	3	2	4	3	7	5	1—30
At 100yds.										
R Miller	9	8	9	7	9	8	8	8	10	9—85
W A Bacon	8	6	7	10	10	9	8	6	5	10—79
H Simpson	9	9	7	5	10	8	8	6	6	7—75
W O'Connor	6	6	10	8	6	7	7	8	6	7—71

W F Seeds	8	5	8	7	8	5	6	6	9	5—67
C Frederick (mil)	2	5	9	6	4	4	6	2	5	5—48

SAN FRANCISCO, Feb. 6.—At Shell Mound Park this afternoon the members of Battery A shot for the marksman's badge for pistol shooting. The distance was 100ft. with a possible 50. The following excellent scores were made by those who took part in the shooting:

Sergeant Darcey	5544555555—48	Lieut. Fletcher	5454454444—43
Captain Smith	5455534555—46	Cor. Mckenhauser	4543444544—41
Al Smith	4554445555—45	Sergeant Stillwell	4444444444—40

A second match with a possible 100, resulted in the following totals: Sergeant Darcy 82, Mickenhausen 79, Al. Smith 77, Captain Smith 75. Another round gave Captain Smith 87, Sergeant Darcey 85, Al. Smith 76, Mickenhausen 69. Sergeant Darcey then shot a string alone and made the remarkable score of 96.

MANCHESTER, N. H., Feb. 12.—The Manchester Rifle Association won to-day, in the match with the Maynard Club, of Chicopee Falls, Mass.:

Manchesters.		Maynards.	
C D Palmer	82	C Garsner	82
A B Dodge	78	H Eagle	77
F J Drake	73	Z Talbot	73
G A Leghton	69	T T Cartwright	67
W Morris	68	O W Horr	62
W Graham	62—422	F N Withrel	61—422

There is but one point difference between the aggregate of the scores made by the first three men on both teams. The clubs are likely to shoot another match.

HAVERHILL, Mass., Rifle Club, Feb. 19.—Very high wind, standard target, 200yds., off-hand:

Tuck	6	10	10	7	10	8	6	8	6	7—81
A Edgerly	7	5	9	9	6	6	7	10	8	10—77
S E Johnson	7	8	7	10	6	7	8	10	8	10—75
J Busfield	7	8	5	8	8	4	8	9	5	10—72
J F Brown	5	6	8	8	7	10	8	10	5	4—71
F Merrill	5	7	7	7	7	7	5	10	9	6—70
C Bliss	7	6	8	7	6	7	7	10	6	5—69
E Brown	4	4	8	4	7	10	8	8	5	6—64

SAN FRANCISCO, Feb. 6.—The bitter cold wind blowing across the bay from snowy Tamalpais did not prevent an unusually large number of ardent shootists from putting in an appearance at Harbor View Park today. During the morning the targets were kept busily moving by the bullets of the Swiss Shooting Club, who were practising for a festival to be held in the immediate future. In the afternoon the members of the California Schuetzen Club were out in full force, the occasion being their monthly medal shoot at ring targets. Some exceedingly good scores were made, the general average being very much better than the ordinary. Strecker's 430 out of a possible 500 is the best score made this season. The following are the names of the medal winners in their respective classes: Champion class, A. Strecker, 430; first class, A. Johnston, 417; second class, A. Fields, 391; third class, H. A. Kuriinke, 349; fourth class, M. Reubald, 336. A young man named Val Smith, who has lately joined the club, scored 412, but not having yet been classified was not awarded a prize. At the conclusion of the medal shoot pool shooting was indulged in by the members, A. Rahwyler being mos successful, scoring 73 out of a possible 75, J. Utschig coming a good second. The monthly medal shoot of the Germania Schuetzen Club was also held during the afternoon, with the following result: First class—1st, Louis H. Kauffung, 395; 2d, Gus. Robertson, 353. Second class—H. F. Roepke, 365; V. Smith, 320. Third class, F. Krug, 303. L. A. Kauffung was also the winner of a prize for the best center shot, scoring 23 out of a possible 24, and also for the last best center shot, scoring 24 out of 25.

TARGET TRAP SHOOTING.—The Raub magazine target trap is coming into general use for rifle practice, and the manufacturer proposes that those who use it adopt some set of rules, that their scores may be intelligible to others. He says: "To make uniformity in practice and giving every person using the Raub trap an understanding of what others are doing with it, I submit the following rules, on which I ask for practical amendments: Divide the shooting into two classes, single and repeating. Directions of trap, 10, 11, 12, 1 and 2 o'clock, the supposed positions of figures on clock dial. Single Class.—First, trap stationary 12 o'clock, 10ft. high, 20ft. line, any rifle, then say 10 shots in each direction. Handicapping by longer line or higher throw. Second, blind the trap, employ an assistant, stationed behind the shooter to work the revolving line, throw the targets so as to give equal number in each direction. In the repeating class follow above rules and keep record of time, counting the greatest number of hits in given time.

TORONTO, Feb. 18.—The West Toronto Junction Gun Club held the fifth competition for the cup presented by Wm. M. Cooper, at 15 Canada blackbirds, 18yds. rise, thrown from three screened traps. The following is the score: Wm. A. Clarke 12, E. Brown 12, P. Wakefield 10, W. Wakefield, 10, F. J. Brimer 10, D C Walton 9, D. Blea 8, W. David se 8, A. H. Royce 8, A Royce 8, B. W. Clarke 7, F. Wakefield 7. Shoot off at 5 birds each: Clarke 4, Brown 3. W. Clarke having won the cup three times, the trophy becomes his property.....The members of the Owl Gun Club commenced a handicap shooting match to-day on Chas. Ayre's grounds for a gold breastpin, presented by the officers of the club, to be won twice before becoming the property of any competitor. Ten shots at Peoria blackbirds. Following are the scores: J Townson 13, J. Montgomery 13, W. McDowell 13, F. Mallet 10, C. Ayre 7, C. Kemp 7, W. Smith 6, A. F. Beatty 6, D. O'Halloran 2, R. Clark 3.

THE TRAP.

Scores for publication should be made out on the printed blanks prepared by the Forest and Stream, and furnished gratis to club secretaries. Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

TORONTO, Feb. 12.—C. Ayres' shooting grounds presented a rather lively appearance this afternoon when a large number of local shots turned out to try the new Niagara blackbird for the first time in Toronto. The five city gun clubs were all represented in the score. There were fifteen contestants for four prizes. S. McClure, of the East Toronto Gun Club, won first; Geo. Carruthers, of the West End Gun Club, second; E. Dollery, of the same club, third, and W. J. Clark, of the Toronto Junction Gun Club, fourth. The Torontos and Owls were left out in the cold, and very cold it was, for a regular blizzard blew across the traps nearly all afternoon, a fact that undoubtedly accounts for the low scores of the winners, which were as follows: Conditions, 12 birds each from 3 traps at 18yds. rise:

S McClure	6	E Dollery	5
Geo Carruthers	6	W J Clark	4

Mr. J. Wells was the efficient referee.

WELLINGTON, Mass., Feb. 19.—The following were the first prize winners today in the various events: 1. Six clay pigeons, Henry and Babson. 2. Six blackbirds, Ames and Stanton. 3. Six blackbirds, Henry. 4. Six clay pigeons, Shumway, Staaton and Ames. 5. Six blackbirds, Stanton. 6. Six blackbirds, Ames and Stanton. 7. Six blackbirds, Swift. 8. Six clay pigeons, Shumway. 9. Six clay pigeons, Stanton. 10. Six clay pigeons, Swift. 11. Six clay pigeons, Stanton. 12. Three pairs bluebirds, Snow. 13. Ten clay pigeons, Stanton and Shattuck. Badges won by Shattuck, Snow and McCoy. Miss and out, Snow and Stanton. Three pairs blackbirds, Snow and Ames.

THE MIDDLESEX TOURNAMENT.

DUNELLEN, N. J., Feb. 21.—The first annual tournament of the Middlesex Gun Club opened at Dunellen, N. J., on the 21st inst. under very favorable auspices. Many were the fears of bad weather from the snow storm of the evening before, but the weather moderated, and though the sun failed to come out in full force, the air was mild and the snow soon disappeared. There were numbers from abroad. Among the celebrated trigger men (and far more will be on hand to-morrow) we recognized Stice, of Winchester Arms Co. (and, by the way, he handled one of their new single barrel repeating shotguns with marvelous success); Stark, Dickey and Straighter of Boston, Budd from Iowa, Hudson and Luther from Syracuse, Organ from Chicago and others from a distance, to say nothing of our local celebreties from all over the State, not to forget "the Mayor of Bound Brook." Great credit is due to the committee, Messrs. Fred Quimby, W. I. Ritch, E. H. Robinson, F. H. Stevens, M. W. Mulford and S. G. Smith, and more especially to Messrs. Quimby and Ritch for the grand success of the first day, and, in fact, for all. First was a miscellaneous sweep. In fact, there were three different sweeps going on at the same time, one at the five traps in the center and two others at the double traps at the wings, as it were, and the cracking was incessant, while the air was filled with the smoke of the burnt powder, and at times hung a little heavy, but many used the Wood and Schultz powder, which lessened the annoyance considerably.

RULES AND CONDITIONS OF THE TOURNAMENT.

The shooting will commence at 9 A. M. and continue until 5:30 P. M. of each day. The live bird shooting will all be from 5 ground traps, under the Hurlingham rules, except gauges, weights of guns and powder charge. No gun larger than No. 10 bore will be allowed. Powder charge unlimited, shot charge must not exceed 1⅛oz. Dixon's No. 1106 struck measure. The guns will be handicapped according to weights, without regard to gauge, as follows: Under 8½lbs. at 29yds. rise; 8½lbs. and under 10lbs., 30yds. rise; 10lbs. and over, 31yds. rise, except in double live bird shooting, when the handicaps will be 20, 21 and 22yds. for the above weights. The grounds are inclosed and except the rear boundary the fence is 80yds. and 6in. from the center trap, and a bird lighting on or striking against the fence is out of bounds and lost. The rear boundary is marked by a line of stakes, 55yds. from the traps, and a bird passing or falling outside of that line is a lost bird. Guns must not be loaded until the shooter is at the score, and no one, unless by permission of the referee, will be allowed to fire off a gun inside of the grounds except when at the score, and then only at the bird or birds to be sprung from the traps. Any one violating this rule will be fined $5. If a party so fined refuses to pay said fine, he will be expelled from the grounds, and any entrance money he may have paid in will be forfeited. The club have adopted the Ligowsky clay-pigeon for sole use in this tournament. The shooting at clay pigeons will be governed by the National Gun Association rules, excepting that the club will not deduct any percentage from the entrance moneys. The moneys in all the sweepstakes will be divided as follows: When twelve entries or less, into three moneys, 50, 30 and 20 per cent.; when more than twelve entries there will be four moneys, 40, 30, 20 and 10 per cent. The sweepstakes will all be class shooting, and the committee and referee shall have power to disqualify any contestant that intentionally misses a bird to drop into a lower class. The ties may be either shot off or the money divided, but unless all concerned agree to divide, the tie must be shot off. Ties in the 50 live bird sweep will be shot off at 5 birds each, and after that number have been shot at all those still remaining in the tie will shoot off, miss and out. The ties in all the other live bird sweepstakes will be miss and out. In the clay-pigeon sweepstakes the ties will be shot off at five birds each until decided.

First miscellaneous sweep (not down in the bill), 10 clay-pigeons; $1 entrance, 40, 20, 20, 10 per cent., National rules, Ritch and Mulford, judges; G. B. Eaton, referee. Stark 10yds. all the rest 18yds:

Stice	1111111110—9	Hudson	1001110100—5
Stark	1111111111—10	Fox	0111011001—6
Miller	1001110000—5	Kleinz	0110110000—3
Smith	1101111111—9	Waggoner	1011111101—8
Davis	1011011101—7	Allen	1110111101—8
Manitz	0110101001—5	Luther	1111011111—9
Dickey	1110111100—7	Wyckoff	0110010111—6
Straighter	1110010011—6	Leigh	1100101010—5
Brewer	1100111101—7	Complete	1100110100—5

Stark first money; other ties divided.

First regular sweep; 20 Ligowsky clay-pigeons, 18yds. rise, National Gun Club Rules, 40, 50, 20, 10 per cent., $5 entrance:

Stice	1111111111111101111—19
Stark	1111111010111111111—18
Brewer	1111111111101110011—17
Dickey	1111111111101101110—17
Straighter	1101111111111111111—19
Kleinz	1101100001000010 w
Davis	1001111010001111101—14
Complete	1000100010010110100—7
E Hudson	1101010001111111010—14
M C Smith	0111111101011111101—16
J Wyckoff	1101101011111101110—15
Fox	1101110101111011011—14
Allen	1111111111010110111—18
Luther	1111011101111111111—18
Waggoner	1111111111011111101—19

All ties divided.

First sweep at 10 live birds, $10 entrance, Hurlington rules, except weight of guns, which were handicapped, G. B. Eaton, referee. The birds were a very inferior lot ("Baltimore birds," old Miles says) and the traps were set so as to open toward the shooter, nine-tenths of all were incomers; out of 319 birds there were but a dozen drivers and some two dozen that could be called good birds. But the committee promise better to-morrow. They will change the traps and give the birds an airing outside for a while instead of trapping right from the club house. Score:

Brewer (31yds)	1111111112—10	Stice (30)	1111111211—10
Budd (30)	1121111212—10	Wadsworth (30)	1112111221—10
Stark (29)	1211110211—9	Dickens (30)	1112111011—9
Kleinz (30)	1001111121—8	Gillespie (31)	1111111111—10
G Heft (31)	1110030120—7	Bob White (30)	1211222121—10
Straighter (30)	1210121111—9	Manitz (31)	0111010111—7
Cracknell (29)	1111212111—10	Hudson (31)	1021110112—8
Jones (30)	1111211111—10	Miles Johnson (30)	1211111111—10
Eley (30)	1111112121—10	Luther (31)	1111112110—9
Dickey (30)	0111111202—9	Complete (30)	1011110111—8
Bowers (30)	0110112110—7	F Class (29)	1021121211—9

Ties, miss and out, for first, Budd, Eley, Stice, Gillespie, Bob White and Johnson tied again on 8 and divided; Cracknell 6, Wadsworth 3, Brewer and Jones 0. For second, Straighter, Dickey and Luther tied on 11 and divided, Stark 3, Dickens 10, Class 0. Hudson and Complete divided third. Figure 2 denotes second barrel.

Ten pairs clay-pigeons, $5 entrance, 40, 30, 20 and 10 per cent.:

Budd	11	00	10	10	01	11	11	10	11	11—14
Dickey	11	10	10	11	11	11	11	00	01	10—14

White	01	11	11	01	11	01	01	11	11	11—16

Smith first, Stark and white divided second, Swather and Luther divided third, Jones, Budd and Dickey fourth.

There were other sweeps at the clay disks on the wings which we did not get.

The Second Day opened very inauspiciously, dark lowering clouds with a very moist and uncomfortable drizzle that threatened anything but fair weather, but the club, with its usual good luck, not only got the big shooters there but they foreclosed their mortgage on Stice and he made the latter part of the day all that could be desired.

The day opened with the 15 clay-pigeon shoot, which took place outside of the grounds and which, in our anxiety to get at the preliminaries of the big live bird shoot, we failed to note. The big race of the tournament that had called together so many of the celebrated disciples of the trigger, was started about 11, with 15 entries, among them some of the best trap shooters in the country and we might say in the world; and here, as in other business, luck has more or less to do with success; some had easy, some hard birds; notably, Williams, Brewer, and Stewart killed some very good birds among the many that fell to them; Stewart especially had good luck. Stice was more than fortunate in having 8 out of 10 incomers. His first miss, the second bird, hit the fence and dropped dead. Most of the money was placed between Graham's and Budd's score, and the western men got away with it. There were many incidents of an exciting character in the match, especially toward the last, and some money changed hands. The birds were better, or at least livelier, than the day before. Grand Sweep, open to the world, 50 single live pigeons, 5 ground traps, entrance $112.50, including the birds; Hurlingham rules except as to guns, which were handicapped by Middlesex Gun Club rules, viz., under 8½lbs., 29yds.; 8½ and under 10, 30yds.; over 10, 31yds. The shooting of Eley and Stice was superb. Wm. Siegler, of Montclair, referee, and a good one; W. I. Ritch, scorer, another good one:

Stice, 30yds	2011111111121121111211 1111111112110211111111—48

Many of the second barrels were shot when not necessary, either at a bird with crippled wing or even dead hit, Hurlingham rules allowing the same; and they are abominable; who would do that at quail or grouse in the field? Bah! Eley and Stice divided first money, $600; Stark and Budd divided second, $450; Graham, Brewer and Davis divided third, $300; Kleins took fourth, $150. And thus ended the second day. JACOBSTAFF.

THE FITCHBURG TOURNAMENT.

FITCHBURG, Mass., Feb. 17.—There was a large attendance at the tournament yesterday at the River Street Range of the Fitchburg Rifle and Gun Club. The weather was all that could be desired. Among those present were George T. Ellsworth, of Gardner; C. W. Burbank and L. M. Harris of Leominster; E. T. Smith, W. L. Davis, W. S. Perry, E. F. Swan, W. R. Dean, M. D. Gilman and Frank Stone, of Worcester; George Sampson, of Clinton; H. W. Eager of Marlborough; Knowles and Bates of Lowell; Aldoes, of Brockton; O. R. Dickey, Stanton and Swift, of Boston; C. M. Stark, of Exeter, N. H.; George W. Weymouth, E. N. Cummings, H. I. Wallace, A. W. Baker, W. J. Fox, J. O. Converse, B. W. McKay, H. D. McIntyre, Charles Dean, S. D. Sheldon and George Colony, of this city.

The principal contest was for the Climax badge, offered by the United States Cartridge Company of Lowell. The conditions are that it shall be shot for twelve times, 10 clay pigeons and 10 blackbirds, and it is to become the property of the one winning it the largest number of times. The contest yesterday was the tenth of the series. Your correspondent not being acquainted with the alias or shooting name of some who contested is not able to give the correct name of all who shot for the prize. The result of the contest yesterday, with that exception, was as follows:

	Clay-Pigeons.	Clay Birds.
Stark	1111111111—10	1111111111—10—20
Davis	1111111110— 9	1111111111—10—19
Croun	1011111111— 9	1111111111—10—19
Eager	1111011101— 8	1111111111—10—18
Smith	0111111111— 9	1111111011— 9—18
Gilman	1111011101— 8	1111111111—10—18
Swift	1111100111— 8	1111111111—10—18
Sampson	0111110111— 8	1110111111— 9—17
Holden	1100101111— 7	1111111111—10—17
Dickey	1111111011— 9	1151111110— 8—17
Perry	1111110011— 8	1111011011— 8—16
Stanton	1011011101— 7	1111111110— 9—16
Swan	0011111101— 7	0111111111— 9—16
Cummings	1111110111— 9	1000111111— 7—16
Arnold	1011110111— 8	0111111011— 8—16
Weymouth	1001110111— 7	1111110011— 8—15
Wheeler	1101010011— 6	0111111111— 9—15
Burbank	0011011100— 6	1101111111— 9—15
Beaudry	1000111101— 7	1110011011— 7—14
Knowles	1110100110— 6	1111110011— 8—14
Bates	0001010110— 4	1011111111— 9—13
Gore	1101111000— 6	0111111010— 7—13
Dean	0000100001— 2	1111011111— 9—11
Longley	0001001101— 4	1011110110— 7—11
Aldoes	1000011000— 3	1010101111— 7—10

The badge has now been won ten times as follows: Henry W. Eager, of Marlborough, with a score of 20; A. F. Cooper, of Exeter, N. H., with 19; Theodore Strater, otherwise called Stanton, of Boston, with 20; C. M. Stark, of Exerter, N. H., with 19; Eager, with 19; Stark, with 18; Strater, otherwise Stanton, with 17; Strater, with 18; Eager, with 19; Stark, with 20.

During the day there were nine other events, as follows: Six bats, with 22 entries; 6 blue rocks, with 24 entries; 10 clay-pigeons, 21 entries; 6 blue rocks, straightaway, 25 entries; 10 clay-pigeons, 15 entries; 6 clay-pigeons, 25 entries; 10 clay-pigeons, 24 entries; 6 blue rocks, 26 entries, and 10 clay-pigeons, 17 entries.

BROOKLYN, Feb. 16.—The regular shoot of the Coney Island Rod and Gun Club at the half mile track, Parkville, to-day, notwithstanding the almost impassable state of the roads, was well attended. Fourteen members shot for the club prizes, while a large crowd looked on. The first was won by Secretary G. L. Ayers, the second by L. Davenport, the third by J. E. Lake and the fourth by H. Monsees. Score:

H McLaughlin, 25yds	0	½	1	1	1	1	½	—5
L Davenport, 26yds	1	1	1	½	0	1	1	—5½
A Schwartz, 27yds	0	1	½	1	1	1	1	—5½

NEW YORK, Feb. 18.—At a meeting of the New York German Gun Club at 154 William street, the following officers were elected: President, F. Boesenecker; Vice-President, August Schmitt; Treasurer, F. Kunz; Secretary, F. Schlicht; Captain, F. Sauter.—TELL.

CLEVELAND, O., Feb. 17.—The semi-monthly contest of the East End Gun Club for the club badge was held to-day at the range near the foot of Cornell street. The day was all that could be desired, and the occasion was made more interesting by the presence of a number of visitors from the Cleveland Gun Club. They cordially accepted an invitation to participate in the shoot. The contest was for 20 birds from 5 traps, 19yds. rise. Among the visitors were Rev. Dr. C. S. Pomeroy, who is a great lover of trap-shooting with inanimate targets, and Mr. E. A. Wetmore, of Marquette, Mich. Messrs. Phare, Auld and Maygo tied for first money, and in the decisive shoot Mr. Maygo was declared the winner. The next meeting of the club will be held on Thursday, March 3. Following is the score:

A Class.

CHOICE OF TARGETS.—*Editor Forest and Stream:* During this week there was a representative meeting of Ohio sportsmen to form the Ohio State League, of which meeting doubtless your regular correspondent will send you full particulars. I address you a few lines on one special subject, hoping that the same will prove a warning to brother sportsmen in other States. An attempt was made at the above meeting before it had been barely organized to capture the same in the interests of two target companies who were the only companies that had their agents at the meeting. This by springing a resolution to adopt two certain targets for the league or association. Such a resolution springing spontaneously from the shooters would be apropos, but coming from interested target manufacturers, plainly indicates an attempt to pack and to utilize such conventions in the interest of such manufacturers and should be promptly shut down upon, as was so efficiently done in the above instance. The energetic remarks of H. F. Robinson, of Cincinnati, speedily opened the eyes of the meeting, and to their credit be it said, the gentlemanly representatives of the Ohio clubs rejected the resolution and thus declined to allow themselves to be used as "cat's paws." The general opinion prevailed that for the present the State Association tournament programmes should be arranged with matches at all the various targets and thus the hundreds of shooters would be able to exercise their judgment intelligently and not be dragooned into buying a trap which they will probably be inclined to discard upon seeing another. Of course if the committee having the matter in charge being familiar with all targets and with the desires of their members should see fit to adopt some one standard target, as was done in adopting the Ligowsky target for the Middlesex Gun Club tournament at Dunellen, N. J., Feb. 21-25, 1887, and as was similarly done by the Texas State Sportsmen's Association in 1886, is entirely a different question and is undoubtedly justifiable on the principle of "survival of the fittest." The point for sportsmen to avoid in all such cases is the suspicion of being utilized through favor, affection or good fellowship to cast their vote in favor of some one target, when their candid judgment, unbiassed by any consideration, would select another.—NEMO.

Canoeing.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signal, etc., of their clubs, and also notices in advance of meetings and races, and report of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

FIXTURES.

28-30. East. Div. Spring Meet, Haddam Island.

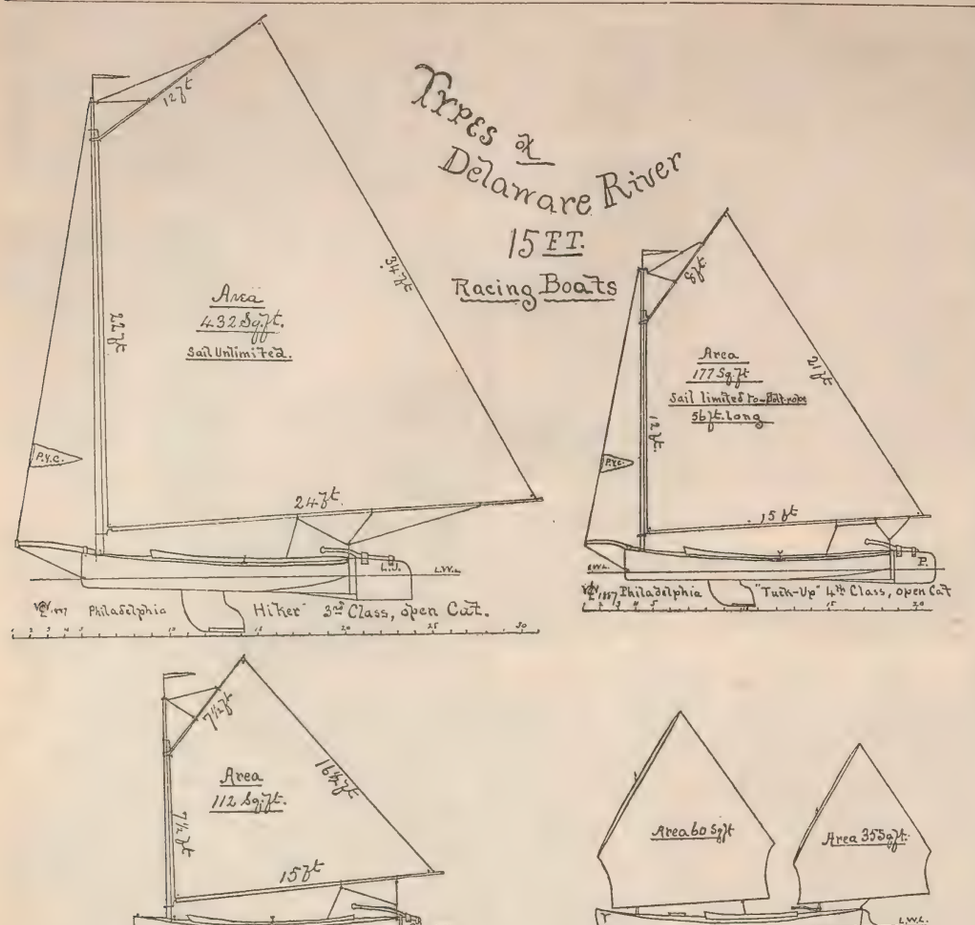
JUNE.

18. Brooklyn, Annual, Bay Ridge.

JULY.

18-31. W. C. A. Meet, Ballast Island.

AUGUST.



12-26. A. C. A. Meet, Lake Champlain.

IDEAL CRUISING ASSOCIATION.—New York, Feb. 14.—*Editor Forest and Stream:* The notice that appeared in your issue of Feb. 10 was the first information I had of my election to the office of admiral of the I. C. A. Our secretary has no record of the meeting referred to, and as I have no way of finding out who the aspirants for membership were, I take this means of calling their attention to Art. CXXVIII. of the Constitution, which says: "A quorum shall consist of one member, and no meeting shall have power to transact any business unless a full quorum is present." They must therefore see that their action is null and void. I take this opportunity to set at rest rumors of a split in the I. C. A., and will explain their origin. During the latter part of December all the members except the admiral were out of town traveling for their health. They all happened to meet in a salt mine and decided to hold a meeting. We had learned from our "official organ," the FOREST AND STREAM, that our admiral had accepted a position on the A. C. A. regatta committee, thus grossly violating Art. II. of the Constitution. Our meeting unanimously passed a resolution requesting an explanation from his highness. His explanation completely exonerated him. He called our attention to the changes he had caused made in the programme by which cruisers would benefit greatly. To quote from his official reply, "I am in the enemy's camp to destroy the racers." We were greatly pleased at his subtle strategy, and are now prouder than ever to look up to him as the head of our Ideal Cruising Association.—THE SNAKE CHARMER.

DURABILITY OF CANVAS CANOES.—*Editor Forest and Stream:* A letter on a "Light Canadian Canoe" has attracted my notice in your issue of Feb. 3. As I have had very considerable experience in canvas canoes, I believe that the danger of a well-designed boat of this description being injured in running rapids, etc., are very much exaggerated. I have run innumerable rapids, and grounded on snags repeatedly in single skin canvas canoes, and have never once had the boat injured while navigating it. Of course, one man's experience does not go for much, still one would like to know, when an accident occurs to a canvas boat, the description of craft, thickness of duck and previous experience of the navigator. It would be interesting for instance, to know what percentage of coracles are injured, as some hundreds of them are in daily use for fishing on the rivers of the west of England and Wales, and though snags are not so common there as in the rivers of America, shallow rapids with rocky bottoms are common enough. It has so frequently been my lot to hear this statement about snags being fatal to canvas boats that I wonder if my experiences have been very exceptional or if the assertion is made on data as unreliable as the celebrated information about Jack Robinson's death. "Somebody had told me, as somebody said, that he'd read in some newspaper."—C. M. DOUGLAS.

A BRITISH CANOE MEET.—A strong effort is now being made to organize a canoe meet for July or August next at some point in England. The Norfolk Broads have been named and seem to meet with the most favor, as the Scotch and Irish lakes are too far away. The Royal C. C. has invited other canoeists to cooperate in making the meet a success, and it is not unlikely that in the event of a good location and some races being assured, some American canoeists may attend.

MEET ON THE PASSAIC.—A meeting will be held in Newark on the evening of March 19, to arrange matters for a regatta and camp of all canoeists on the Passaic River, to be held about July 4.

CANOES VS. SAILING BOATS.

Editor Forest and Stream:

Pictures speak sometimes louder than words, for which reason I add the inclosed sketch to the discussion of canoes vs. sailboats, believing that it will illustrate one of the reasons why a broad canoe is better than a toothpick one. The drawings are all made to one scale and are accurate. All four boats have the same waterline length, but vary in beam and depth, viz.:

	Canoe.	Ducker.	Tuckup.	Hiker.
Beam	31½	48	54	56
Depth	11	13	14	16
Sail area, square feet	95	112	177	432

Whatever advantage is given in the drawings is in favor of the canoe. Last year there was only one canoe on the Delaware River that carried 95 sq. ft. of sail—it went out three times and upset twice, so that 95 sq. ft. is certainly the maximum amount of sail for it. With the ducksers, however, there are two on the river that have carried 150ft. for several seasons, but as 112ft. is the usual rig, and ducker men are usually men who have graduated out of hikers and are satisfied to take things cool, the larger sails have not become fashionable.

The tuckup could swing 300 sq. ft. if desired, but the clubs limit sails to 56ft. length of boltrope and that restrains them within limits.

The hiker is unlimited as to sail, with the result shown; to keep a hiker right side up requires nearly as much ingenuity and is quite as great strain on the mind as to prevent a canoe turning turtle.

We have a new canoe club at Gloucester, organized in December.

C. L. W.

A GOOD IDEA IN TENT BUILDING.—A new tent, invented by Capt. Newburgh-Steward, R. N., is described by *Land and Water* as follows: "The novelty consists in the manner in which the gallant sailor has avoided the necessity of anything like sticks or poles, or even tent pins, and the economy in space and weight thus effected. The framework of the tent is composed of eight ribs, or laths, of American elm, which are socketed together at the top. A staple is fitted in at the point of junction, and the tent is skillfully stayed in either of two ways. Either a rope is passed through the staple and threaded through a double galvanized iron block, secured by an ingeniously simple and holding staple of Capt. Newburgh-Stewart's invention, which is let into the center of the floor of the tent and hauled taut, till the ribs of the tent bend into the beehive shape so commonly seen in gipsy encampments, or a weight is suspended from this rope, which has the same effect. In this last case the advantage is obvious. Traveling in a desert, where there would be no hold for the staples, pins, or stays, an empty bag, of no weight to carry, may be used and filled with sand, after it is suspended, until the required strain is attained. The particular tent I saw was beautifully made of an extra stout unbleached duck. The doors and windows are a vast improvement upon those of the older types. They are oval apertures cut in the tent and fitted with blinds working up and down within canvas doublings, like those in use in railway carriages, which effectually close them. Time, weight and space Capt. Newburgh-Stewart economizes."

DRAWBRIDGES OVER NAVIGABLE WATERS.—*Editor Forest and Stream:* I have been frequently compelled to go ashore while canoeing and unship masts while coming to a drawbridge, by the bridge-tenders refusing to open the bridge, saying that "them little fellows (canoes) aint got no right to make us open the draw." They seem to draw the line somewhere between a ducker and canoe. Can you give me any information regarding our status in the different States?—IANTHE. [A search through the laws of New York and New Jersey disclosed no reference to obstruction by drawbridges, but no such obstruction of the navigable waters of the United States is permitted by the laws of the United States, and no discrimination is made as to the size of the boat. Bridge-tenders, as a rule, are averse to opening for small boats, but an application to headquarters will sometimes prove effective, as the law is on the side of the boat. Perhaps some of our readers who have had experience in the matter can give further information.]

CANOEING PROSPECTS.—A correspondent in Dubuque writes that they have seven canoes and more in prospect for the spring. Some of the canoeists will visit Ballast Island in July. Mr. Rushton has just received an order for eleven open canoes from Dayton, Ohio, and one Mohican No. 1 from Cincinnati. He is now busy on an order for fifty Douglas canvas boats for Squires, and up to Feb. 18, the month's orders are in excess of those for the same time last year.

A NEW FOLDING OUTRIGGER.—Thos. Laughlin & Son, of Portland, Me., have just introduced a new outrigger and row-lock for canoes and boats that may be folded inboard when not in use.

THE OCEAN YACHT RACE.

ON Feb. 16 Messrs. Colt and Bush met at the New York Y. C., and in their presence the following agreement was drawn up by the secretary, Mr. J. H. Bird:

"R. T. Bush, owner of the Coronet, and C. H. Colt, owner of the Dauntless, with respect to the terms and conditions of the ocean race between their respective boats, agree as follows: The yachts will start from Owl's Head at 1 P. M., on March 5, 1887, provided the Coronet can be got ready by that time. If she cannot be got ready by that date, then the start will take place at as early a day thereafter as possible from the same place and at the same hour. The regatta committee of the New York Y. C. will signal the start. The yachts may carry any sails at will. The Dauntless will burn a blue signal light at night, and the Coronet will burn a red signal light at night in presence of passing vessels. The finish will be off Roche's Point, Cork harbor, when the light thereon bears east southeast (magnetic). The yacht Coronet in crossing the finish line will fire five guns in quick succession, and immediately thereafter discharge three red rockets, one perpendicularly, one due east and one due west; and the yacht Dauntless at the finish will fire three guns in quick succession, and immediately thereafter discharge three blue rockets, one perpendicularly, one due east and one due west. The sum of $10,000 each shall be deposited by the giving of a certified check to the order of F. W. J. Hurst, treasurer of the New York Y. C., between the first and the fourth days of March, 1887, the entire amount of which, less the expenses of the judges' boat, shall be paid by him to the winner upon the receipt by him of definite knowledge to his satisfaction of the result of the race. The start shall not be made unless the wind is westerly or tending thereto. The offer of the Royal Cork Y. C. to judge at the finish is accepted with thanks by both parties."

Dated New York, Feb. 16, 1887.

In presence of John H. Bird.

(Signed) R. T. BUSH.
CALDWELL H. COLT.

Some discussion has arisen over the question of signals, and at Mr. Bush's suggestion the yachts will display the club signal, a green, red and green Coston light at night, Dauntless burning a blue light immediately after and Coronet a red one. It is also stated that rockets can only be used as danger signals under the English law, and so the signals at the finish must be changed.

The Dauntless has been lowered from the screwdock where she has been refitted under the direction of Capt. Samuels, who will command her. Some six tons of lead have been removed from inside and cast in the keel at various places. Eight spaces have been cut in the wooden keel and filled with lead. As the boat has been lightened a shoe 6in. deep has been added. Her copper has been well cleaned and repaired and the topsides are newly painted. The masts have been shortened 5ft. and the topmasts lengthened as much, while the jibboom is 3ft. shorter. Masts and spars have been thoroughly scraped and varnished, the rigging has all been removed and put in perfect order at Mr. Low's loft before being replaced, and Mr. Sawyer has gone over all the sails. The topmast and jibbooms are so fitted as to be quickly housed. Coronet has been at Poillon's yard, where Capt. Crosby has had charge of her fitting out. She also will have some ballast transferred to her keel, about 15 tons of iron being removed from inside and 8 tons of lead cast in the keel. The foremast has had 4ft. cut off the heel. The bowsprit is strengthened with a truss, two wire ropes passing from heel to outboard end, and over iron struts set over the stem. She has not hauled out yet and may not be ready by March 5, in which case the start will be postponed until she is ready for sea.

NOTES FROM THE DELAWARE.

THE Southwark Y. C. has had trouble for a long time on account of no water at low tide at their headquarters foot of Mifflin street, and are agitating for a removal to better quarters. Any place would be an improvement over Pitt wharf.

The owners of club houses at Gloucester have been annoyed lately by a thief who has broken into three houses. A short time ago the owners held a meeting, formed the Edgewater Protective Association, appointed a watchman, and offered rewards for the apprehension of the thieves, and since then no further trouble has occurred.

The water front for nearly a mile at Gloucester is covered with boat houses. There is no other city in America that can show such a front, and it is well worth inspection by visiting yachtsmen.

The Quaker City Y. C. held its eleventh annual meeting at 1227 Chestnut street, followed by a banquet given by the newly elected officers at Rudolph's. The officers elected were: Chas. E. Ellis, Commodore; Thomas S. Manning, Vice-Commodore; William H. Mickle, Rear-Commodore; William H. Vallette, President; S. B. S. Barth, Secretary; William S. Hoffman, Corresponding Secretary; Joseph J. Arbelo, Treasurer; Rufus G. Wilkins, Measurer; Prof. W. J. McConnell, Fleet Surgeon. The new Board of Trustees are Robert P. Thompson, Alfred Box, Samuel A. Wood and Oswald McAllister. Regatta Committee, William J. Thorman, A. F. Bancroft and Chas. L. Wilson. The new constitution was adopted after some little argument, except the clause relating to time allowance, which was referred back to the committee. Some few fossils are trying to do away with time allowance altogether, but the progressive members will win and a modern table of allowances will be adopted eventually. The secretary reported that 31 new members had been received in the past year, making 105 members on the roll. After this, to use the general objector's words, the deadwood was cut out, leaving the club with only active members in full sympathy with it. Three new yachts were enrolled, the steam yacht Volante, Alfred Box, owner; first class sloop Vesper, R. S. Nickerson, owner; third class sloop Gretchen, Chas. L. Work, owner, making 37 yachts enrolled on the club list. After adjournment the banquet was discussed with considerably more vigor than any previous motion, to an accompaniment of a gentle flow of wit from the president, ably seconded by the C. K. (constitutional kicker).

The yacht Volante, enrolled by Alfred Box, was formerly the steam yacht Rosaline, owned for several years by Jay Gould in your waters. Mr. Box has taken out the old Herreshoff boilers and put in two new boilers of his own construction. They are coil boilers with horizontally inclined tubes, and give him greatly increased speed. She is now the speediest yacht on the river.

C. L. W.

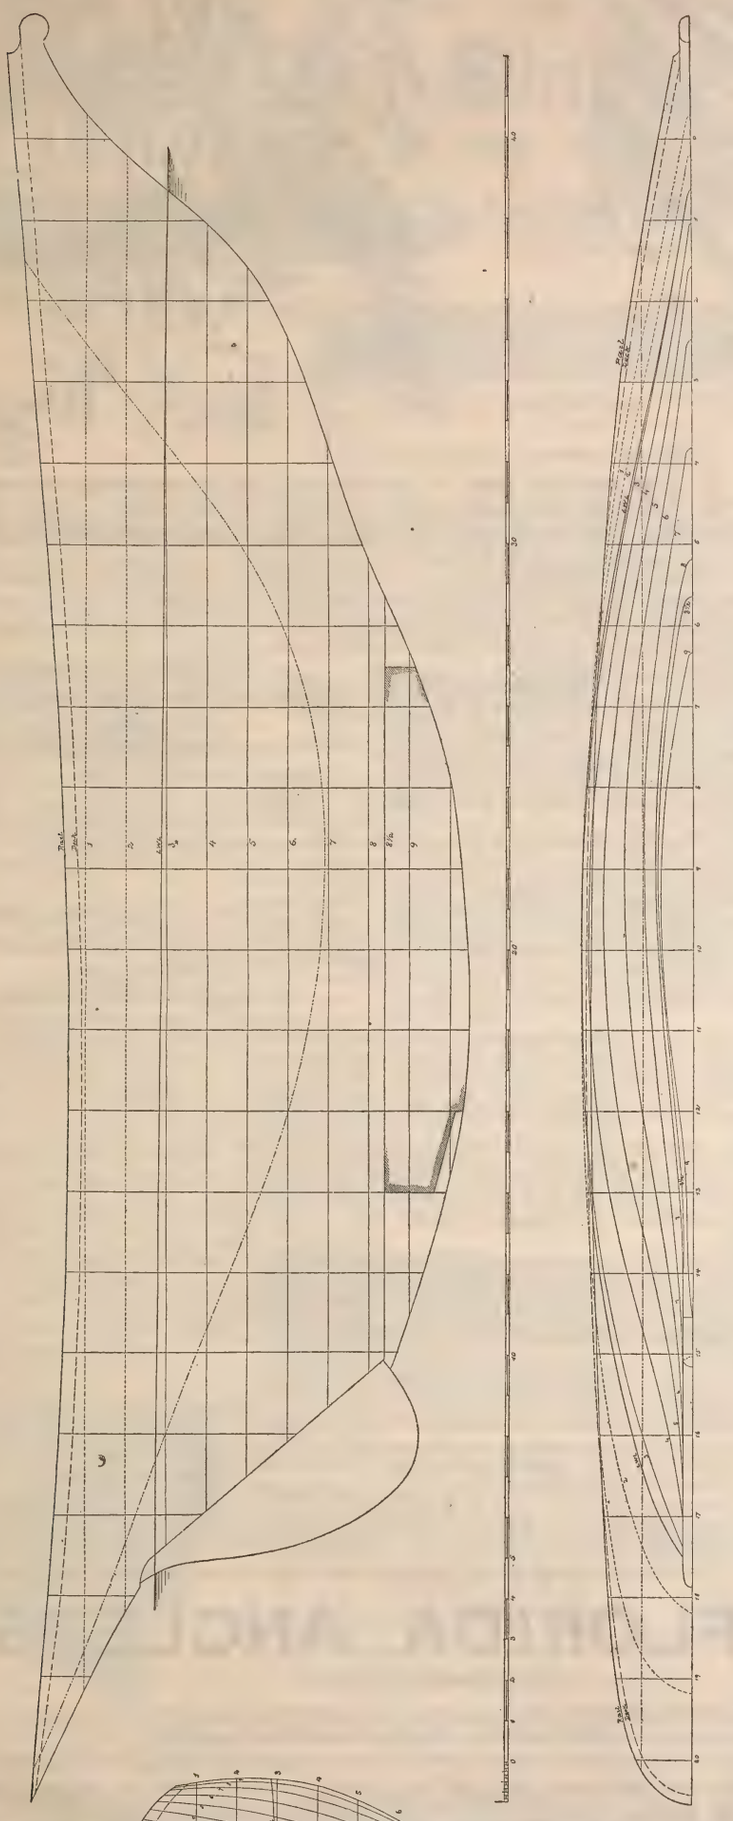
THE JUBILEE RACES.—No further particulars of the proposed races have been made known, but the course announced by the Royal Thames Y. C. has been generally criticised by English yachtsmen as well as by Americans. Lt. Henn has written strongly against it, proposing the substitution of one of the following courses: From the Needles or other points in the English Channel around one of the Azores, distance about 2,300 miles. Round the Berlengas Islands, off the coast of Portugal, and back, distance about 1,700 miles. Round the Fastnet Rock, Cape Clear, Ireland, and back, distance between 700 and 800 miles. As no final arrangements have yet been made, it is to be hoped that the R. T. Y. C. will decide to change the course for a fairer one. An English yachtsman writes to the *Field* as follows: "As an old member of the R. T. Y. C., and having sailed round Great Britain in my own yachts sixteen or seventeen times, I am desirous of adding my testimony to that of Mr. Frank Willan as to the inexpediency of choosing such a course for a sailing match. So uncertain would be the result, that the owners of the yachts competing might as well draw lots before the start for the possession of the prize.—W. ORD MARSHALL (Algiers)."

NEW YACHTS FOR THE DELAWARE.—*Editor Forest and Stream:* I am in receipt of some fine views of Mr. Wm. Howell's cutter, built by Collins, Cooper's Point. She is full blooded in form, and is receiving a thorough cutter rig at Cramp's yard. Doctor Howell, though approving his son's choice, adheres to the yawl rig especially for cruising. "When we make changes we do not expect to fully realize our anticipations. But when the results are in excess as in the Sea Gull (yawl) then indeed we have cause to rejoice. I put her to a crucial test last year on the coast in as bad weather as I ever experienced, and I could not have wished her to do better," said the Doctor with some warmth. After she has been altered forward she will closely resemble a low-bilged cutter, and will perform even better than now. The Minerva, of Trenton, has had four feet taken off her mast, and gaff proportionately increased. More lead will be placed on bottom. Commodore Charles Ellis will probably give Mr. Burgess an order for a 70ft. sloop. In that event Mr. Colburn, owner of the Venitzia, will, no doubt, vote strongly for a suitable time allowance.—R. G. WILKINS.

CRUISING.—Mr. Waterbury's steam yacht Lurline made the run from Sandy Hook to Beaufort, N. C., in 32 hours, arriving on Feb. 18, and stopping for coal before proceeding to St. John's River. On Feb. 19 she sailed for Savannah.... Wanderer, schooner, Mr. Geo. W. Weid, left New Bedford on Feb. 18 for Bermuda and the West Indies.....Norma, steam yacht, is fitting out at South Brooklyn for a cruise to Florida.....Magnolia, steam yacht, arrived at Key West from Fernandina on Feb. 18, and on the same day the Saus Peur, steam yacht, left Key West for a cruise along the coast.....Schooner Helen, Mr. Chas D. Middleton, arrived at St. Augustine, Fla., on Feb. 13. Should the cruise not be changed her southern objective point will be Cuba. The owner is very much pleased with the trip and the way his ship behaves and expects the log to make a good showing on the return to Philadelphia. The run will be off shore.

OSWEGO Y. C.—A hard rubber button is being introduced to take the place of the brass button which, although it has never been officially adopted, has found its place in every buttonhole in the club. Mr. Burgess's new design for a 38ft. racing sloop for ex-Vice-Commodore Ames, is the sensation of the day; she is being built by Lawley, and it is expected that the long, uninterrupted series of victories that has fallen to the Canadians will be abruptly terminated when the small Puritan flaps her wings as she rounds the home flag. The Ariadne is for sale; Mr. Sackett wants a larger craft.—K. G.

WORK AT CITY ISLAND.—The name of Titania has been chosen for Mr. Iselin's steel boat. The material is now on the ground, the frames are bent and punched, the keel laid and the centerboard trunk nearly completed. The stem is bent and drilled, and as a number of men are at work the frames will soon be in place. Mr. Burgess is to visit City Island this week and inspect the work. Cinderella has been launched from the railway and now lies afloat in the basin. The new timbers are in place in the Palmer, and her bottom is being replanked with oak.



A NEW CATBOAT.—Thomas Fearon, of Yonkers, N. Y., has now in frame a catboat 28ft. over all, 25ft. waterline and 12ft. beam, to draw 2ft. She will have a cabin house about 7ft. in length, cockpit and companionway to be finished in mahogany; she will steer with a wheel and be fitted with one of Mr. Fearon's patent reefing booms. Those who delight in good workmanship would be pleased with this craft. She is building for Mr. R. Underhill, of sloop Adelaide.

ALVA.—On Feb. 15 the Alva left the foot of Sixty-fifth street, North River, N. Y., and steamed down the bay bound on a short cruise to Bermuda and the West Indies. She anchored off Tompkinsville over night and passed out to sea about 7 A. M. on Feb. 16. Besides her owner and his wife and children, were Messrs. W. S. Hoyt, Gould Redmond, F. O. Beach and Dr. E. L. Keyes. The crew number 55 all told.

ICE YACHTING.—The North Shrewsbury I. Y. C. has challenged for the pennant won by the Jack Frost, and a race will be sailed soon. The following races are now to be sailed as soon as the weather permits, for the Edwards challenge pennant, and for four silver prizes presented by Judge Gildersleeve, of New York. A proposition has been made to form an association of all the clubs in the Hudson River.

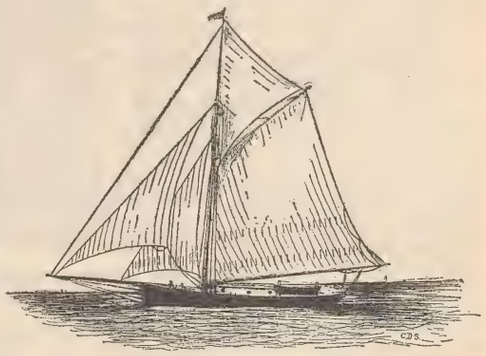
THE BRETAGNE.—We learn from private advises that Mr. Henri Say's fine steam yacht is offered for sale. It will be remembered that she is an American built vessel, being built in Baltimore in 1881. Her length is 240ft, and beam 32ft. 6in., and she is bark rigged. Her equipments and furnishings are of unusual elegance.

NAMOUNA.—The Namouna, with Mr. Bennett and a party of friends on board, was at Aden on Feb. 4, *en route* for Bombay.

FIVE-TON RACING YACHT JENNY WREN.—DESIGNED BY R. E. FROUDE, ESQ.

A MODERN FIVE-TON RACER.

THE adoption of a length and sail area rule in Great Britain opens up a wide field of conjecture as to what type of boat will be the ultimate outcome; but, whatever the final result may be, it seems probable that for some time longer the narrow boat will continue to hold its place at the head, as far as the small classes are concerned. With Queen Mab and Doris at their head the ten and five-ton classes are tolerably safe for some time to come, in spite of the boats that may be built under the new rule to beat them. The yacht herewith illustrated is one of the latest additions to the five ton class and represents the most advanced type of narrow yacht, as, though two years old, the narrowing process had practically stopped within that time. Doris has so far overtopped her class and has sailed so high when compared with larger boats that it is no discredit to rank second to her, and this place Jenny Wren may fairly claim. In 1885 she sailed 10 races and won 9 prizes, 6 of them firsts; the sum of her winnings being £54. In 1886 she scored two firsts and one second prize, with a total of £25.



Jenny Wren was designed by her owner, Mr. R. R. Froude, who has for some time been in charge of the experimental station of the British Admiralty at Torquay, England, lately removed to Gosport. Mr. Froude is the son of the late Mr. Wm. Froude, so widely known from his investigations concerning the laws that govern floating bodies, and while following successfully the line of theoretic research so ably carried out by his father he is a practical yachtsman also. While his design follows in proportion and general features the usual type of narrow cutter, a special effort has been made to gain the greatest possible advantage from the ballasting, and the lead is disposed of as low down as could well be done, while at the same time the lateral plane is so cut away as to facilitate turning. The principal dimensions and elements of the boat are:

Length, over all	42ft. 9in.
Length, l.w.l.	33ft. 9in.
Beam, extreme	5ft. 5½in.
Beam, l.w.l	5ft. 5½in.
Freeboard, least	1ft. 10½in.
Midship section from stem	18ft. 7in.
Displacement, long tons	11.4
Keel, lead, long tons	7.5

Jenny Wren is of composite build, from the yard of Simpson & Dennison, at Dartmouth. As originally finished she had too great a weight of skylights, hatches and deck fittings for a racer, and suffered in stability accordingly; but last winter these were much reduced and her keel was recast, the result being an improvement. This year she has sailed well, but the demoralized condition of A Class racing in the south of England has affected the fives in a very unfavorable manner, and there has been but little sport. With all the old boats she has done well, and though the northern crack proved too much for her when they finally met, she made a good fight against a boat that may well be called invincible. Our drawing shows but little of her appearance when afloat, but her photographs, especially one taken at anchor, prove her to be a very handsome craft.

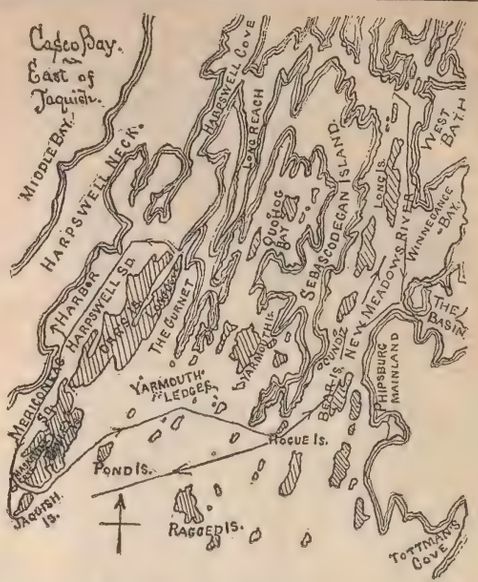
A CRUISE OF THE TEMPUS, 1885.

PART FIRST.

IN THESE days of snow and ice, when yachts lie snug in winter quarters, many a sailor's thoughts linger over the pleasures of the past season; and as we sit about the wide old fire-place, when the driving no'theaster howls down the chimney, and story and song while away the evening, perhaps the log of our spring cruise may not come amiss. It was in a part of the Atlantic almost unknown to yachtsmen, but its picturesque scenery and quiet, land-locked harbors make an humble claim for place among the summer cruising grounds of the New England coast.

First, let me introduce the yacht whose hospitality the writer has found unfathomable. She is a deep sloop, 55ft. long, 10ft. beam, 6ft. draft, and 12 tons displacement. The cutter rig, after long trial, has been adopted, because most easily managed by her small crew. Under full sail she is readily handled by one person, and she will creep to windward surprisingly, as many a rival will testify. "Bedecked, ornate and gay, with all her bravery on and tackle trim," she is about as good an all-round boat as one will often find.

"Adaptability to surroundings is a chief requisite to life aboard a small yacht," says the skipper of the Coot. The cabin of the Tempus is an almost perfect adaptation of means to ends. Two berths are on each side, where by day snowy linen and warm blankets lie perdu behind portieres. Forward a chest of drawers makes a buffet for table napery, knives, forks and spoons, and above it are piled the "Coast Pilot," sailing directions, charts and knick-knacks. Lockers here and there are for dishes, canned goods, spare ropes and the impedimenta of the sailing master. Ice cooler and binnacle sit lovingly side by side on the shelf, and below are magazines and other reading matter. Under the companion way the water cask never seemingly runs dry. Garments of various shapes and purposes, both masculine and feminine, burden hooks in convenient corners. The clock and barometer have the place of honor by the mast with several fine engravings, marines, of course, on each side. In the fok'sle is the galley, whose mite of a stove always fills me with reverence for the skill of him who can not only cook on it an entire bill of fare, but can keep it hot, too. Pots and skillet garnish the side, while flour, sugar and green groceries are packed in convenient places. In the forepeak is the ice box, where such perishables as butter, milk and eggs repose in frigid silence. And the coils of cable deserve notice, too, thas have been tested in many a "dry sou'wester." The interior maket a compact home, whose details have been evolved from many a cruise or spare hour on shore.



Her owner is a young physician with a love for salt water like that which fired the hearts of the old Berserkers. The yacht is his idol and he is happiest when, grasping the spokes of her wheel, he is the host, whose guests are expected to be happy like himself. When sailing two topics seem to be the ever-present skeleton, "Nate, can you pick up that black buoy yet?" and "Skipper, got enough grub for the crowd?" When I say—and surely a personal experience of the worst gale of the summer, lying to ten miles out at sea all night, ough to be a sufficient ground for judgment—that the Tempus is a good sea boat, comfortable, fast enough and always "well found," she ought to please any fair-minded sailorman.

History is written in the past tense, yet the scenes of our cruise are as fresh as if present. Thursday, the 28th, has come. The morning slips away, all to quickly, in stowing away coal, wood, spare rope, bedding and the other necessities of a week's trip. Finally at 3:40 the ensign is run up and we hail the order "Cast off your mooring." The deck is soon ship-shape, ropes coiled away and before Bug Light is abeam, most of us have already begun the do nothing of yachting.

But below is confusion worst confounded. Everything in the way of grip-sacks, clothing, rugs, rubber boots, camp-stools, fresh bread, pastry, boxes and things in paper bags is piled upon the cabin floor. The gentle westerly breeze, an earnest of the summer trade-winds, heels the vessel, under full sail, and the sun, already hot, is smiling its prettiest upon us. Willis is sent to the wheel and the captain and sailing master strip for the fray. Flannels and once rejected unmentionables are the correct style, and for an hour "there was the sound of revelry" below. Everthing is finally in order above and below and the entire crew muster on deck.

At the beginning of every cruise some one is deputed to keep the log. This year the initial page is headed thus: "Station Bill, Captain, Dr. B.; Sailing Master, Nate Young; Bos'n, Capt. Brewer

(an old salt who has plowed the sea for thirty years, but at last has come to anchor with us); Bos'n's Mate, Willis with a G. (who has built yachts and sailed them over every foot of the Maine coast); Unable Seaman, Perkins (who thinks he knows more about sailing than the Bos'n); 'Doctor', Perkins, assisted by all hands."

In the midst of the chatter about him Willis suddenly hails the Captain, "Well, Skipper, what's the course? Where shall I head?" "Anywhere you please," is the reply, "just where all hands want to go, Harpswell, Boothbay, Camden or Bar Harbor will suit me." After a moment's thought Willis says, "Ever been up New Meadows Run? If not, I think you would enjoy that region, especially if it is new to you." "Go ahead, you have the wheel," is the assent, and the route is settled.

We are in the inside passage to Harpswell Neck, with Fort George on the right and Big and Little Diamond beyond, looking bright in their spring foliage. The breeze freshens, and in an hour we are off Little Chebeag, with its summer hotel not yet opened. The water is as smooth as a country mill-pond, protected as it is her abouts from the swell of the open ocean by the many islands that lie between us and the open water—Cow, Long, Hope, Crotch, Little Barys, Stave, and the rest. The chart is well studied as we thread the intricate passages about Thrumb Cap and Pott's Harbor. At five o'clock we round the end of Harpswell Neck, leaving Haskell's Island on the right, and get the first ground swells as we sail gently into Mericoneag Sound.

The chart of the coast of Maine looks much like the fringes of a shawl or, better, like the fingers of one's hand. Sailing in these bays and sounds resembles the tracing of a line up the finger to the tip, then down the side back to the hand, then up the next finger, to round its point and come down its side to the hand again. Just so do the "necks" and inlets of Casco Bay interdigitate. For there extend off from the mainland long promontories and then, in lessening size, islands and reefs and single rocks, something as if a mighty harrow had been drawn northeast and southwest off the shore, and the debris, caught in its teeth, had been dropped into the ocean. Between these are innumerable waterways, usually deep and with abrupt sides, along which the tides rush far inland for many a mile.

Like the equator, "an imaginary line" is the boundary line between Mericoneag and Harpswell Sounds. Their outermost eastern boundary is Bailey's Island, which has a famous refuge for seiners and coasters—Mackerel Cove. Next above is Orr's Island, famous as the home of the heroine of Mrs. Stowe's novel, the Pearl of Orr's Island; its rounded crest checkered with woods and farms; some three miles long but only half a mile wide.

The lovely afternoon goes on apace, while the wind, dead aft, drives us by headland and cove, and the further we sail the more does the quiet landscapes delight us. The sun is retiring behind the Harpswell Hills, though loath to release the charms of shore and water. "Haul aft your main sheet and give a pull upon the jib and staysail." The wheel is put over and just between Dog's Head and Much Zeke's islands we run through a narrow pass and enter the head of Long Cove. At 7:45 we dropped anchor, twenty-five miles from home.

The night toilet of the yacht claims first attention from the crew, while the galley funnel shows the presence of the cook below in the fo'k'sle. The welcome call of the bos'n rings out upon the ear, "All hands below for rations," and the companionway steps rattle under the answering rush. There is plenty of room in the cabin, yet none to spare, and a transverse horizontal section of it would be berth, campstool, supper table, campstool, berth. Sundry evolutions of twistings and genuflexions about the board are doubtless enjoyed by the cabin lamp, though not a flicker betrays its emotions.

It is too early in the cruise to spend much time on things gastronomic, and soon the entire company are on deck, and using up their entire stock of adjectives. The young moon silvers the ripples of the cove, and touches the birches and spruces with the brush of fairy land. An exploring party starts away in the gig. The world hereabouts is still, with that intense stillness of the woods, and we can hear the creak of the rowlocks long after the gloom has swallowed up even the sparkle of the oar drips. The report shows that the cove is appropriately named, for it is a mile and a half long, though only two hundred yards wide. The shores are from eighty to one hundred and twenty feet high, and even at low tide six feet of water can be found through nearly its extreme length. Surely there can be but few such bits of quiet loveliness.

Early to bed is the Captain's order, and after chaffing the cook and planning for to-morrow, we wish

"To all, to each a fair good night,
And pleasant dreams, and slumbers light."

Not a sound disturbs us until Friday's sun pours through the skylight, and shows the good judgment of our pilot in selecting so safe and picturesque a harbor. The only break in the circle of land is to the left, the gap through which we entered last night. On the right are the bold wooded shores of Sebascodegan and Orr's Islands, connected by a newly repaired bridge over a tide-way. The young flood was rushing through it, forming a channel for boats from the Gurnet, one of the reaches east of Orr's Island. The sides are cut sharp as if by a giant's plow, and fringed by a thick underbrush, while black rockweed sways to and fro at the water's edge. This tideway is a short cut from outside into the cove, for we rowed only a few hundred feet to reach a point that the yacht sailed twenty miles to make afterward.

Astern, as we lay at anchor, a little point jutted out from the mainland, upon which was a small weather-beaten story and a half house. It was evidently inhabited, for, late in the morning, smoke from the chimney drifted lazily away. At length a nondescript looking individual, sex not recognizable, hobbled down to the water's edge to stare at us. Many were the surmises why Dame Fortune had allotted to some unfortunate a home in this lonesome place. A belated fisherman, hurrying homeward from an early clamming visit down the Cove, answered our hail with the reply, "It's the poor house." "God help them," was our united prayer; "remote, unfriendly, melancholy, slow," seemed to express the subject best.

All sail was set and at 9:30 the anchor was weighed. The sun was hot, wind south and light, but promising to do better later. We retraced the course of yesterday as far as to the mouth of Mericoneag Sound, where Bailey's Island was rounded to the east through Jaquish Cut, the usual course for coasters is outside of Jaquish island, as the Cut is shallow and dangerous except for light draft vessels. Jaquish is like a great wedge of rock, whose point extends some hundred feet into deep water, and on it the long swells rolled and broke. It looks quiet and sleepy enough this morning, but in an easterly storm its mood changes to that of a roaring, frothing monster.

While under way we usually dine *al fresco*, so at noon we munch hard tack and sandwiches, sardines and olives, "hermits" and Maine doughnuts, washing them down with coffee and "jest and youthful jollity," as we square away eastward for the course of the afternoon.

We take our departure from Jaquish, keeping well in to land. Bailey's Island is on the left, and then Orr's Island above it. On the right are Pond Island Ledges and Pond Island, then the middle grounds to Ram Island. What a peculiar nomenclature has the ocean and its belongings. Associations, local or wide as the ocean itself, cluster about points and reefs and bays, peculiarities or accidental happenings inflict themselves as titles and are finally accepted.

With a good sailing breeze abeam, the course is east by north, between Yarmouth Ledges and Elm Island for Jenny's Island, which makes the western end of the mouth of New Meadows River. Around this region names are evidently suggestions. Two-Bush Ledge, David's Castle, Ragged and Mark Islands, Ballast-stone Ledge, Yellow Rock and Jenny's Nubble. At 1:40 we make Rogue Island in the mouth of the river. STANLEY P. WARREN.

CHARTS OF THE BRITISH COASTS.—American yachtsmen will this year look with some interest on British waters as the location of two or three, if not more, important races, and many who cannot cross themselves will follow the matches on the chart. We have just received from Mr. Geo. Wilson, No. 20 Glasshouse street, London, a full list of British charts and guides to navigation. Mr. Wilson also sends a long list of yachts of all sizes for sale by him.

SALE OF THE YACHT C. G. GREEN.—This steam yacht has been sold to Mr. S. S. Ingraham, of Hamilton, Bermuda, who will put her under the British flag, changing her name to Intrepid, and will use her for mail and passenger service among the Bermudas. Her hull and engines are receiving a thorough overhauling.

HULL Y. C.—The regatta committee, appointed by the executive committe, are Messrs. M. J. Kiley, Chairman; L. M. Clark, Secretary; J. J. Souther, Com. Whitten and Vice-Com. Converse. A change in the sailing regulations is under consideration.

A SCHOONER FOR ENGLAND.—It is reported that Mr. D. J. Lawlor has designed a schooner yacht for an English yachtsman, to be 100ft. l.w.l., 24ft. beam, and 12ft. draft. Mr. Lawlor has in hand also the design for a 60ft. yacht for a Boston owner.

SEAWANHAKA CORINTHIAN Y. C.—The second regular meeting of the S. C. Y. C. for 1887 will be held at Delmonico's on Feb. 26, the date being advanced as it is desired to take immediate action on the report of the special committee on location.

NIRVANA.—Gen. Perkins's schooner left New York for Bermuda about Jan. 12, and thus far has not been reported as arriving there or at any of the West Indian ports.

CROCODILE.—This fast sloop has been sold by Mr. J. G. Prague to Mr. Wm. Thorne, of Bay Shore, L. I.

NORSEMAN.—Mr. Goelet's schooner is at Tebo's pier, where she is receiving new masts.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

WINCHESTER.—You might hire the rifle at some of the gun stores or shooting galleries.

C. S. R., Loudonville, N. Y.—Liver and white is more common than orange and white. There are good ones of both colors.

HOOSIER, Indianapolis, Ind.—Malite (Meteor — Vanity) won Western Derby 1885. Rod (Meteor—Dell) won second at the Western field trials in 1887. Fred (Meteor—Flash III.) won second at the Texas field trials in 1887. 2. Train oil and whale oil are the same.

B. F. W., Philadelphia, Pa.—The best authority on the subject is "Small Yachts." There is nothing cheaper. Such a boat as you intend to build will cost several hundred dollars, exclusive of labor, and the cost of the book will be saved many times over before your boat is completed.

PUBLISHER'S DEPARTMENT.

THE SPRINGFIELD ROADSTER is a new bicycle put on the market by John P. Lovell's Sons, Boston, Mass. It is described as strong, because made of the best weldless steel tubing and steel forgings, and as having speed because a larger per cent. of the power expended is gained by the use of the lever than by the crank motion. The safety of this machine is a point upon which the company lay special emphasis as resulting from the device in its construction, which is alluded to as rendering it impossible to take a header. In their circular describing it the company refer to this feature, and in explaining why headers cannot be taken they say: "When the large wheel strikes an obstruction the pivotal point is changed from the axle to the point of contact with the obstruction. The power being applied back of the center of large wheel and directly underneath the weight of the body with the levers forced downward, it relieves the blow, and the tendency is for the wheel to pass over the obstruction without materially checking its revolution. But should the revolution of the large wheel be checked for an instant the momentum would raise the rear wheel sufficiently to lock the fork and backbone to the clutch and thus force the large wheel over the obstruction by its own momentum and the power applied by the levers. The locking of the backbone and fork to the clutch prevents them from traveling forward after the speed of the large wheel has been retarded and the weight of the body, combined with the power of the lever, forces the wheel over the obstruction. In short, without clutch-lever the backbone and fork cannot be forced forward without revolving the large wheel. By this means we change the pivotal point from the axle to the point of obstruction, thus preventing the rider from traveling faster than his wheel and taking a header by coming in contact with an obstruction." Besides the above they make the following points in favor of this machine: "That it is especially adapted for hill-climbing; that it is safe for coasting; that from the use of the lever instead of the crank long distance road riding is made easy and that it commends itself to business men and all riders as safe under all circumstances."

THOUSANDS are born with a tendency to consumption. Such persons, if they value life, will not permit a cough or cold to become a fixture in the lungs and chest. The best known remedy for either is Hale's Honey of Horehound and Tar. PIKE'S TOOTHACHE DROPS cure in one minute.—*Adv.*

TO FLORIDA ANGLERS.

TRADE MARK.

Keeping fully abreast with the times, we have the last few seasons given particular attention to the manufacture and introduction of tackle specially adapted to the needs of Florida anglers.

We have an unusually fine assortment of the following goods, used and recommended by expert Florida anglers:

Pearl Florida Spinners, Mottled Pearl Baits, Pearl Squids for Spanish Mackerel, Pearl Mullet, Florida Bass Flies, Tackle for Channel Bass, Red Snappers, Sheepshead, Salt Water Trout, Etc., Etc. Also New and Special Tackle for TARPON, including our famous Tarpon Line.

If your dealer does not keep our goods in stock, or will not order them for you, send us 50 cents for our 180-page fully illustrated catalogue.

Two Beautiful Illustrated Books

PADDLE AND PORTAGE

AND

Canoe and Camera.

BY THOMAS SEDGWICK STEELE, of Hartford, Conn.

123 exquisite illustrations of life in the woods with map in each copy.
The humorous as well as the serious side of camp life is vividly represented, while Mr. Steele's well known artistic perceptions, and a most intense love of nature, has made the work all that could be desired.
SEVEN EDITIONS of these works sold. Most popular books in the market. Cloth. Price $1.50 each.

FOREST AND STREAM PUBLISHING CO.

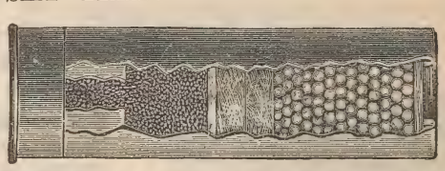
Learn to Shoot on the Wing!

No. 1. "BLUE ROCK" TRAP AND TARGET. The best ever invented, its flight closely imitates that of a quail or grouse. They always break when hit, causing no disputes. Has the best record ever made. Has been adopted by the New York Sportsmen's Association, the Illinois Sportsmen's Association, the Central Ohio Shooting Association and numberless clubs.



No. 2. "THE SNIPE." A target equaled by none except the "Blue Rock." Can be thrown from the Peoria trap, or the Red Bird trap, by attaching an arm, which we furnish. OUR SNIPE TRAP, however, is the best.

No. 3. "THE BLACK PIGEON." The cheapest target in the market. Always breaks when hit. Its flight is good. The best flying target that can be THROWN FROM A LIGOWSKY TRAP.

No. 4. THE CHAMBERLIN CARTRIDGE. The best ammunition in the world for breechloading shotguns. The highest scores at the trap and in the field have been made with them.

WRITE FOR OUR ILLUSTRATED CATALOGUE.

PRICE, POSTPAID, $2.00.

FOREST AND STREAM PUBLISHING CO.,

39 Park Row, New York.

The Forest Waters the Farm;

OR,

The Value of Woodlands as Reservoirs.

BEING THE LES ÉTUDES DE MAITRE PIERRE SUR L'AGRICULTURE ET LES FORETS.

PAR M. ANTONIN ROUSSET.

Translated by

REV. S. W. POWELL.

The introduction reviews the extraordinary movement of torrent taming in France, in preparing public sentiment for which the Studies of Master Peter played a noteworthy part. The book was written as a sort of science primer, setting forth the first principles of the relations existing between woodlands and agriculture. The principles and reasoning are not less applicable to the United States to-day than to France then.

Price in cloth, 75 cts.; paper, 50 cts.

A WORD IN SEASON.

Readers old and new of the FOREST AND STREAM may be pleased to know that the paper is now at the close of 1886 enjoying the support of a wider circle of friends than at any former period in its history. This is an interesting fact, for it proves, with the best possible demonstration of success, the sound sense of the theory long ago adopted by editors and publishers, and steadfastly adhered to, that there is room in this country for a journal treating the subjects embraced by our departments, and depending for its support wholly upon what have been accepted by the conductors of the FOREST AND STREAM as legitimate journalistic methods. In other words, we have kept faith with subscribers by devoting our reading columns exclusively to honest reading matter, and have not given up our pages to extended paid puffs of railroad routes clumsily disguised as accounts of sportsmen's travel, nor alluring descriptions of wonderful agricultural regions, all paid by the column. The conviction that a sportsman's journal for sportsmen could be conducted without resorting to such questionable makeshift expedients have proved quite correct.

The tone and high character of the journal, as one fit for sportsmen to receive into their homes, will be jealously maintained. As there is nothing in the recreations of field and stream inconsistent with the highest type of manhood, so, the editors are convinced, there should be in a journal like the FOREST AND STREAM nothing to offend good taste.

The FOREST AND STREAM will be, in the future as in the past, thoroughly representative of the best field sportsmanship of America. It will maintain its position as the chosen exponent of those who seek recreation with gun or rod, rifle, canoe or yacht. Its character will be scrupulously preserved, and readers in 1887 may expect a rich fund of sporting sketches and stories, suggestions, bright sayings, prompt, reliable news, and interesting discussions. Angler, shooter, dog breeder, canoeist and yachtsman, may be assured that whatever is of interest in these respective fields in 1887 will find its way into the columns of the FOREST AND STREAM.

The Sportsman Tourist

columns are filled with bright sketches of travel, camp life and adventure, the reflected experience of a host of outers.

Natural History.

Papers descriptive of bird life, chapters of animal biography, notes on the ways of field, forest and water creatures as observed by sportmen, anglers and naturalists, make up these pages. The special work of the past year has been the establishment of the Audubon Society for the Protection of Birds, begun in February, and having now a membership approaching 20,000.

Angling and Shooting.

Time was when a single journal sufficed in this country for adequate discussion of all the heterogenous pastimes and practices dubbed sport. That time has long since passed away Some of the sports have been outgrown or put under a ban, others have developed to such a degree that each class requires a special organ. The particular fields chosen by the FOREST AND STREAM are those of angling and shooting. The pages given up to these topics are rich with the freshest, brightest, most wholesome, entertaining and valuable open air literature of the day. They have the sunlight and woodsy odor of the haunts of game and fish; they picture nature as seen by sportsman and angler. One has not long to read the FOREST AND STREAM before learning its attitude with respect to game and fish protection. The editors believe in conserving, by all legitimate methods, the game of fields and woods, and the fish of brook, river and lake, not for the exclusive benefit of any class or classes, but for the public. They are earnest, consistent and determined advocates of strict protection in the legal close season, and in restricting the taking of game both as to season and methods, so that the benefits of these natural resources may be evenly distributed.

The Kennel.

This department has kept even pace with the growth of the interest of breeding field and pet dogs. Reports of trials and shows are usually given in the FOREST AND STREAM in advance of other publications, and being prepared by competent writers their intelligent criticisms are of practical utility. This journal is not hampered by personal animosities. It has no judges to "kill." It does not decide a dog's merit by asking who the owner is. It treats all kennel subjects without fear, favor or ulterior motives, and in consequence enjoys a degree of public confidence and esteem denied to such as stagger beneath the incubus of malice and flounder in the bogs of ignorance.

Rifle and Trap Shooting

records scores of meetings and matches, discussions of topics pertaining to the butt, gallery and trap. Secretaries of gun and rifle clubs are invited to send their scores for publication.

Canoeing.

This country is a land of magnificent water courses, and Americans are just beginning to appreciate the canoe as a means of enjoying the delectable charms of river and lake, and bay and canal. The men who are making fortunes by making canoes know best how rapidly the ranks of canoeists are multiplying. Novices and old hands will find in the FOREST AND STREAM canoeing columns, in charge of a practical canoeist, accounts of cruises, lines of new craft, and hints and helps and suggestions without number. Closely allied is

Yachting,

in which the FOREST AND STREAM is the only competent, all-the-year-round, intelligent exponent. Our reports of races are full, prompt and accurate. The numerous illustrations of lines of new yachts make an invaluable record of the development of yacht building.

Weekly, $4 per year; $2 for six months.

ANSWERS TO CORRESPONDENTS.

THIRTY-TWO PAGES.

To meet the demands on its columns this number of the FOREST AND STREAM *has four additional pages, thirty-two in all.*

IT HAS FAILED.

THE closing days of the forty-ninth session of Congress are here, and the Yellowstone Park bill has not passed the House. It should have become a law. In the Senate, the bill was very fully and carefully discussed. Those Senators who were opposed to it brought up all the arguments that could be urged against it, and these arguments were so satisfactorily answered by the friends of the bill that the measure passed by the overwhelming vote of 49 to 8. Then it went to the House, where instead of being referred to the Committee on Territories, which would have seemed to be the natural body to consider it, it went to the Committee on Public Lands. This was unfortunate. A prominent member of that committee is Judge Payson, of Illinois, who is known as the champion of the gang of railroad schemers, who for years have been striving in one way and another to secure for their own selfish ends the Park which was set aside by Congress in 1872 for the benefit and enjoyment of the whole people. Judge Payson's attempt to engineer this railroad scheme was not crowned with any very flattering degree of success. The House, under the able leadership of Mr. Cox, of this city, had promptly declined to grant the desired right of way, and now, when the Yellowstone Park bill came before the Committtee on Public Lands, Judge Payson had a chance for aiding the railroad project or for killing the bill. He had determined to report it with an amendment cutting off a large tract of land from the north side of the Park, and by this cunning device giving to the railroad speculators the right of way which Congress had already refused. This design we exposed, and his scheme having been ventilated and brought to the attention of the House, he felt that it could not be carried out. He failed to report the bill in time for it to be considered, and at the present writing it seems improbable that it should come up.

This is the second time that we have been in sight of the promised land, the second time that a good bill for the care and improvement of the Park has passed the Senate by a great majority, and has then, at the last moment, failed in the House.

The present Congress has made a record which is disgraceful to itself and scarcely less so to the people of these United States. Lacking the wit to appreciate the signs of the times, incompetent, dull, slow, it has passed few good measures, many bad ones, has neglected to act on many others of very high importance, and now finds itself with almost all the appropriation bills unpassed. Our Representatives are too many of them looking only to what may inure to their own advantage, and care little or nothing what becomes of the interests of the people. If there are shining examples who are exceptions to this rule, men whose moral fibre has gone through the furnace of political struggle and come forth unwarped and unscorched, they are but few in number—the exceptions which make the sordid partisans governed by low motives seem more base.

That the bill should have failed again is discouraging. To those who have, for four years and more, labored faithfully and without reward for the protection of that Park which belongs to the nation, this failure means more work, which in the face of every discouragement will be as faithfully and earnestly performed as it has been in the past. For ourselves we have every confidence that some measures will be taken by the next Congress to protect this reservation. We feel sure that when Congress next meets the people will make known their will in such unmistakable terms that that body will no longer delay the performance of its duty. Signs of the deep feeling existing on this subject have already been shown in various sections of the land.

In the meantime the Park is in charge of Captain Harris, a gentleman deeply interested in its protection. He will do everything in his power with the troops under his command to protect it from harm and from spoliation, and for the present we must leave its care to him.

SNAP SHOTS.

THE patent coffee mill is grinding away at a great rate at Albany. A dozen or more bills have been introduced into the Assembly. Among the queer notions embodied in the bills is the project of Assemblyman Davies, of the game law committee, to name Wm. N. Harris of New York county, Franklin Brandreth of Westchester, W. W. Byington of Albany, Rufus J. Richardson of Lewis, Eli J. Seeber of Jefferson, Solon S. Hunt of Oneida, Seth Green of Monroe, W. F. Weston of Essex, and Joseph McNaughton of St. Lawrence, as "a Commission to act with the Commissioners of Fisheries of the State in preparing a bill for the protection of fish and game within the State." The enactment of this measure and its enforcement would be nothing less than cruelty to the Commissioners. The president of the board already has his hands full in trying to engineer a bill to suit everybody, including deer hunters who want to hunt in May, and woodcock shooters who want to shoot in July. If in addition to all this, Mr. Roosevelt and his colleagues should be compelled by Mr. Davies's proposed law to listen to Byington's plea for deer hounding twelve months in the year, and Rufus Richardson's contention for thirteen; while McNaughton would want to do away with hounding *in toto*; and Green would require a man to paste on his bait box a certificate of good moral character from his Congressman before fishing in any of the private waters stocked with State fry from Caledonia—the resultant "codification" would be interesting chiefly as a harmless enigma.

Did you ever, while sitting on a log waiting for that deer, reflect on how much happier was your lot than that of the poor devils in Chatham street, New York, who run their sewing machines on pantaloons eighteen hours a day for seven days in the week for fifty-two weeks in the year, with never a respite but to get together Saturday night and drink beer?

A fire of unexplained origin which broke out in the FOREST AND STREAM office early in the morning of last Thursday did considerable damage, chiefly by the destruction of valuable files. Among other things a large number of *American Kennel Registers*, reserved for binding, were burned. The full extent of the loss has not yet been determined, but it is quite probable that it will be found necessary to reprint some of the *Register* numbers, as the demand for bound volumes is constantly increasing. It will take something hotter than a newspaper office fire to affect the prosperity of the A. K. R.

The members of the National Field Trials Club, who have formed a new organization with the expressed intention of dissolving the old one, have evidently taken this step as the readiest way to get rid of rotten timber. Instead of trying to regain lost public respect for a body that has repeatedly permitted field trial rascality to go unwhipped of justice, they have made a new start altogether. The public will welcome the change, and will be more than ready to accord to the American Field Trials Club all the support its direction may deserve.

By the way, when those gentlemen at Cincinnati, the other day, came to the conclusion that the National Field Trials Club was "in bad odor," we wonder if they recalled, among other causes leading to unsavory reputation, the club's action a few years ago, when, in direct violation of good faith, it turned over to a Chicago publisher certain kennel pedigree registries which the club had secured from the FOREST AND STREAM only with the distinct understanding that no such disposition should ever be made of them. That stud book venture has so far had the retributive bad luck that sometimes hangs over a scheme conceived in iniquity.

Col. Tom Picton, pupil, companion and biographer of Frank Forester, once thought it would be a bright notion to establish a sportsman's club room in New York, where anglers and shooters might congregate for social intercourse. This scheme may be realized if the National Rod and Reel Association shall put into execution its social club project. Picton, by the way, has a most remarkable vocabulary, and an astonishing command of it in writing or talking.

Here is another triumph of fishculture. In our review of the Georgia Fish Commission in another column will be found the statement that no shad were found in the rivers that empty into the Gulf of Mexico until these waters had been stocked with them. Since the plantings nearly every river in Georgia, and some in adjoining States, which empty into the Gulf, have shad in them. These plantings were all made by the United States Fish Commission.

Worse than good for nothing are two Adirondack officials, who regularly draw their game protector salary, and one of whom last summer, camping with a party, put out his own hounds and ran deer in close season; while the other one, having arrested and jailed a man for taking trout through the ice, himself sat down to eat with relish trout caught in the same unlawful manner by another individual.

The oldest member of the Piegan tribe of Indians out in Montana bears the name of Almost a Dog. Into Atlanta, Ga., the other day came an old man who thought himself altogether a dog. Georgia State Lunatic Asylum officials had him in charge, leading him by a string tied to his coat lapel; the old gentleman barked like a dog, and tried hard to prick his ears forward when he saw anything interesting.

Among the clubs memorializing Congress to pass the Yellowstone Park bill, was the Jersey City Heights, (N. J.) Gun Club. It is hoped that the numerous clubs and associations which have shown such an interest in this matter may renew their efforts when the subject again comes up at Washington.

Little baby lobsters boiled to a bright red are sometimes set forth as "free lunch" bait in barrooms. Assemblyman Finn has introduced a bill at Albany to repeal the law which forbids traffic in little baby lobsters. Finn runs a barroom in New York city.

A Maine lumberman states that it costs only 87½ cents a week per man to board his logging crew. How much crusted venison is to be included in the provisions?

When in debate on game or fish legislation a man howls for "cheap food for the people," he will bear close watching.

THE TURKEY SHOOT AT HAMNER'S.

THE morning of the day before Thanksgiving was bright and still, promising such a day as a rifleman would wish for target shooting, and before the middle of the forenoon almost every man in Danvis who owned a rifle, and some who did not, but were enough in favor to borrow one of owners too old to use one, or too impecunious to share in a sport that called for a "York shillin'" a shot, was at Hamner's hostelry, or hurrying toward it across lots or along the rough frozen roads. And as many or more than these were those who went with hands in pockets, otherwise empty, to look on enviously, and rugged-faced old mountaineers whose dim eyes could no longer sight a rifle and whose palsied hands had shaken off all their cunning, to criticise the younger shooters and tell marvelous tales of what they could do and had done in bygone years; and also penniless and stingy topers who scented occasional free drinks among the possibilities of the meeting. One of them, standing in the middle of the road, slowly spelled out the words on the sign which the proprietor had lately hung out under the eaves of the smart and flimsy new piazza, "H, a, m, Ham, n, e, r, s, ner's, h, o, t, hot, e, l, le, hottle! Humph! I wonder if the rum-m-m, [his lips clung fondly to this comprehensive name for all alcoholic intoxicants] in a hottle is any better 'n what it uster be in a tarvern? I'd a darn sight druther see the ol' sign stuck up on the post aout there, 'Tarvern—ent'tainmint for man an' beast.'"

"Wal, it sartingly did look more horsepitiful," said Solon Briggs, turning his critical glance from the new sign to the old post still standing, though uncrowned, by the roadside. "But this is a age of reprovement, 'Niram, an' ol' things is dis-pearin' an' new things is a-pearin'."

"Say, 'Niram," cried the most smartly dressed young fellow in the crowd on the piazza, "Du you ever drink anything naow-er-days?"

"Wal I du," thirsty Adoniram promptly respondéd, "When I can't git snow t' eat!" and casting out his quid he bent his steps in the direction of the prospective treat, following close at the heels of the young man as he led the way into the barroom. When Adoniram had poured his gill of raw spirits down his throat, his entertainer called his attention to a showily-trimmed rifle standing within the safe precincts of the bar. "There, 'Niram, is what you may call a linger gun. Reach it aout here, Hamner. That's the weepon 'at's agoin' t' pop the turkeys to-day! Haint it a steeple-picker?" brushing its German silver ornaments with his coat sleeve and sighting one of the tack heads which held a horse advertisement to the wall. "Thirty-five dollars in money I paid Varney for makin' on it, an' he warr'nts it t' fetch 'em every time! The' haint nob'dy livin', you know, 'at c'n beat Varney—Burl'nt'n, you know—a makin' a rifle. Naow, look a here," seating himself on the bunk, which was the principal article of furniture in the room, and motioning Adoniram to a place beside him, and lowering his voice to a privately confidential mumble, "when they git a turkey sot up, an' I'm a goin' tu hev a shot, I want you, 'Niram, tu kinder gwoup half way er so, an' kinder drop yer hat off, sorter accident'l, so 's 't I c'n see haow much wind the' is a stirrin' aout there. 'F you'll be clever 'nough t' du that much for me, 'Niram, you sha'n't suffer none f'm bein' dry t'day!"

"I will du it, *Mister* Putman!" said Adoniram, emphasizing his promise with a strike of his fist upon his knee, "not 'at I keer a darn for hevin' a drink er tew gi'n me, but aouten clear frien'ship! Me an' yer father was allus frien's, went t' school together, 'n' got lickin's, 'n' fit 'n' eat one other's nutcakes, 'n' everything, an' I'm a goin' t' du his son a good turn whence ever I git a chance, I be! Yes, *sir!* Ahem! Seems 's 'ough that 'ere spoo' f'l o' rum was a feelin' kinder lunsome in my in'ards, *Mister* Putman."

"Ex-cuse me, Niram, I was jest a goin' to ask ye 'f you wa'n't a gettin' dry. Set aout yer best, Hamner; 'taint none tu good for my frien's."

"Hamner's rum an' the river is putty clust neighbors," Adoniram remarked, remembering to smack his lips only when the last drop of his generous potation had passed them. "This 'ere don't seem to take a holt much."

"That's the clear quill, 'Niram," said the publican, pouring a spoonful into a glass and smelling and tasting it. "The clear quill, fourth proof, cost me—le' me see—"

"Clear quill!" Adoniram broke in on his calculations, "Duck quills an' geese quills, I guess like 's not. They was a tellin'," bestowing impartial winks on the son of his friend and the proprietor of the hotel, "haow some-b'dy 'nuther faound a minny alive an' kickin' in his sper-its here t'other day!"

"Hello, Jeems! Hello, 'Nirum! well named, wa'n't ye? Allus nigh rum when it's araound!" cried a big bluff newcomer with a heavy rifle lying as lightly as a reed in the hollow of his arm. "Come, Hamner, set up them 'ere poultry an' le's hev a crack at 'em!"

"Wal, it is about time we was at it," young Putnam assented, hauling out a gold-plated watch and consulting it ostentatiously, "seven minutes t' ten!"

"Sartinly, sartinly, Mr. Dart; I was only a waitin' for the folks tu rest 'em an' stiddy the narves an' re-fresh 'emselves up. You're a lee-tle faster 'n what I be, Mr. Putman," said Hamner, looking at the barroom clock.

"I sot my watch by Austin's t' V'gennes last week, an' he reg'lates the sun," Putnam asserted.

"Pshaw, Hamner!" said Dart, after looking at the tall clock and listening attentively a moment, "yer pleggid ol' m'chine 's stopped runnin'! You'd orter hev a crank stuck int' yer ol' minute mill an' take a day an' grind aout time anough t' last ye a week! But I see yer idee. You wanter git us so 's 't we can't see a hole through a ladder 'fore you let us shoot! Wal, le' me speriment wi' yer pison. I'll resk one drink. Come Jeems an' 'Nirum, le's die together. Here 's a hopesin' 'at we'll pass away kinder comf'table. There, Hamner, 's a nimep'nce, an' that 'ill pay for aour drinks, bein' 't we're all light drinkers, 'specially 'Nirum. Naow, Hamner, you take it an' don't ye grumble. You c'n buy a pint o' proof sperits wi' nimep'nce, 'n' that'll make a gallern o' sech nourishment 's this. Say, boys, hev another an' I'll give him a quarter. Little haint much, an' twicte haint often! No? Wal, then, le's go 'n' kill one of Hamner's chickadees 'fore we die."

The outbuildings of the tavern straggled along the bank of the intervale, on the broadest part of which was room enough, too much, some thought, for the range. Beyond the stable was the stand, which was simply a plank with one end resting on a horse, the other on the ground, and out toward the furthest curve of the little river stood a dry goods box on which the turkeys were to be placed. "Thunder in the winter!" Dart ejaculated, as he looked over the range with a half shut, calculating eye, "you call that forty rod, Hamner? M'asured it with an injin rubber string, didn't ye, 'n' pulled like a yoke o' stags? I sh' like t' buy the interv'l 'cordin' to that m'asure. But set one up!"

The long, lank, sharp-faced publican directed an assistant to bring out a turkey, and after a fluttering commotion in the stable he reappeared with a half-grown one under his arm, and took his way across the flat toward the dry goods box. "O, what a turkey!" Dart shouted, "Haint ye got no aigs ter set up? Wal, Hamner, you be tough, tougher 'n a biled aowl! But nev' mind, I 'm a goin' ter shoot—that's what I come here for. But a feller might jes' 's well shoot at the moon—'t aint much furder off, an' it's bigger."

"Wal, yes, some bigger, John," said Joseph Hill, taking off his hat and scratching his head meditatively, "leastways when it's full, which it don't seem as 'ough that turkey was."

"Oh you shet up, Joe Hill!" Hamner snarled, "Turkeys is what's called for, an' that 'ere 's a turkey, haint it?" and he glowered a sidelong glance at the giant Dart, who, good-natured as he was, looked too big to quarrel with.

"Sartinly, Mr. Hamner," said the amicable Joseph, "that's the name on't, I haint no daoubt. A turkey 's a turkey soon 's he's hatched."

"Say Bill!" Dart shouted after the bearer of the turkey, "got any lunchern in yer pocket? You'll git hungry 'fore you git there. An' say, Bill, holler when ye git yer gobbler set up, so 's 't we'll know. He's most aout o' sight now!"

At last the poor bird was placed in position, Bill retreated to a safe distance and the cover of the river bank, and Dart lying down on the plank rested his rifle across the end of it. After much sighting and squinting he cocked his piece and taking careful aim, fired.

"Sol', for a nimep'nce!" he proclaimed as the turkey was seen to flutter and fall from upon the box.

"Don't b'lieve ye teched him! He's only scairt!" Hamner snarled, unwilling to believe that his turkey had gone for so little money. But all doubt on that score was removed when Bill took it down and began his journey toward them, a dozen of the party running out to meet him.

"'T won't take 'n more half on ye tu bring in that turkey," Dart called after them. "Naow, Hamner, you be ketchin' another tu set up. I want a mess whilst I'm 'baout it an' got my hand in."

"Not by a gol darned sight you don't hev another shot! You s'pose I'm a goin' tu hev the bread took aouter my maouth that way? One turkey 's 'nough for anybody but a darned hawg!"

"You're jest right, Hamner. One turkey 's as much as anybody 'd ort tu eat tu oncte, an' all I want is one a-piece for the fam'ly. The' 's five on us, none on us very hearty t' eat only gran'maw 'n' the baby, an' five turkeys is all 't I want. But the' haint nothin' small 'baout me only my feet," holding out a No. 12 "stogy" for inspection, "which you may not think they be, but a feller's boot haint his foot. Mine 's small, but a big boot fits 'em best. I don't push for the nex' shot. Here's Mr. Putman, which he's got him a rifle 'at cost him thir-ty-five dollars in money, an' Varney made it, which that means all you've got t' du is tu show it a turkey an' it fetches him! An' Mr. Putman wants a few. 'N' here's Peltier Gove, he's got the Widder Wiggins's rifle, which it was Pete's, an' he give Hatch the price of a ye'rlin' colt for it, an' the' 's some 'at says haow Hatch c'n make jes' as good a gun as Varney any day, an' Peltier wants tu find aout. An' here is Jozeff Hill; he's a luggin' 'raound one o' Seaver's ol' fewzees which they say he *hes* hit a barn with it, bein' 'at he was on the inside on 't an' all the doors shet. An' the' 's lots more on 'em 'at hes tu heng on t' the' guns tu keep 'em f'm goin' off arter turkeys. I'm willin' for half on 'em tu hev a chance whilst I rest my gun a spell, for it's turrible strainin' on a gun t' shoot so fur. Wal, here's Bill mos' tuckered aout a luggin' of that turkey aout there 'n' back 'thaout restin' much 'n' nothin' t' eat all the time. Le' me see where I hit him. Right in the butt o' the wing! That's where I allus hit 'em—when I don't miss on 't. Haint he an ol' sollaker! Sary Ann 'll hefter put the stuffin' on the aoutside—the' haint room 'nough on the inside,"

Presently Bill went out with another turkey across the flat, the light snowy covering of which began to show a dun path in the direction of the target. Following him went 'Niram with unsteady footsteps till he got half way across the range, where he halted and threw up his hat with a lusty, if obsolete, cheer for "Tippycanew an' Tyler tew!" As the hat dropped beside him, hardly slanting to the light breeze in its fall, in the exuberance of his spirits he kicked at it, and missed it, and too top-heavy to balance himself, found himself suddenly seated by it. Regarding it for a little with tipsy solemnity as if wondering "how came we here?" he picked it up, knocked the snow off it, set it upon his head, slowly got himself upon his feet and meandered back to the stand. The turkey was in position and the foppishly dressed young man of the name of Putnam got himself upon the plank with a great flourish of preparation.

"Naow Jeems," Dart advised as he was sighting his rifle, "you'd better le' me onbutten the strops o' yer trousers, erless you'll pull the tricker off 'm that thirty-five dollar gun o' yourn er bust yer strops!" But Putnam fired without taking this precaution, and the trigger and straps came safely out of the ordeal, and so did the turkey.

"You 'd orter pulled harder, strops er no strops, an' kinder pushed tew, mebby; a bullit needs helpin' sech long shots. I gi'n mine a boost, 'baout ninety weight, nigh 's I c'ld cal'late."

"This 'ere John Dart a-pears tu be a very jokus individdwil," said Solon Briggs to Joseph Hill, "we hed ort tu give him a invite tu jine aour sore-eyes up to Lisher's, he would make 'em more convivualler." Joseph hardly understood him, but recommended an alum curd poultice as the best remedy for sore eyes, "thaout 't was lobele steeped intu sperits."

"These 'ere half len'th rifles haint wuth a soo markee fer long shots!" Gran'ther Hill whistled savagely, though toothlessly, casting a scornful glance at the thirty-five dollar rifle and its owner. "I wish 't I hed me my gun here, 'at I hed tu Hubbar'ton an' Bennin't'n, I'd show ye! An' I would ha' hed it 'f I'd hed me a flint 'at hed any more fire in 't 'n a hunk o' col' johnny cake. Couldn't find nothin' in the haouse but a Injin arrer. Ye can't git a decent flint naow-er-days sen these pesky cap locks come in fashi'n. Flints is the thing tu tech off paowder, I tell ye! They burns it slow, an' yer ball don't git started fer t' go ontwell the paowder 's all afire, an' then, sir, it goes tu kill! Fo' foot in the berril that 'ere gun is, an' when it's pinted at a thing, you knows it, an' so does what it's pinted at!"

"It ort tu, 'f 'taint tew fur off," Dart said too loudly.

"Fo' foot in the berril!" the veteran repeated, taking no notice of the interruption but to frown on the speaker, "an' it haint a inch tew long! Ethin Allin hes shot it, an' so hes Seth Warner, an' so hes Remember Baker, an' so hes John Stark! An' the' don't nobody 'at's here a shootin' popguns tu-day 'at wants ter up an' tell me 'at they wa'n't shooters an' men 'at knowed what guns was! John Stark says he tu Bennin't'n, says he, 'Them red cuts is aourn, boys, er Molly Stark 's a widder! Come on, Josier!' An' tu Hubbar't'n, Seth Warner says he tu me, says he, 'Josier, I want ye tu pick off that 'ere British offycer wi' that long gun o' yourn.' An' sir, a minute arterward that offycer was scase! I was in the fust bwut 'at went aouten Hand's Cove on the tenth o' May, in the mornin' airly, seventeen hund'ed an' seventy-five, an' Ethin Allin was a standin' in the bow, an' he wa'n't a mite afeard, 'cause I was a settin' right behind of him. Bennydick Arnil was along, tew, the damned traiter, an' I wish 't I hed a done what I wanted tu, chucked the cussed hook-nosed hen-hawk int' the lake, blast him! Wal, sir, when we landed an' was drawed up inter line, an' stood a waitin' an' a waitin' for the rest on 'em tu come over, Seth an' mongst 'em, an' it begin tu grow light in the east, an' a rwuster begin to crow up tu the fort, Ethin he begin tu git turrible oneasy, an' at last says he, 'If we wait for the rest on 'em any longer, daylight 'll spile aour plan. Every man 'at's willin' tu go for'ad naow, pise his firelock!' An' sir, every man jack on us did it, quicker 'n ever hell scorched a feather! Then says Ethin, says he, 'Is Josier Hill here?' 'I be', says I. 'All right,' says he, 'for'ad, march!' 'Fore we got tu the gate, the' was some squabblin' 'twixt Ethin an' Arnil 'baout which was a goin' in fust, an' Ethin come putty nigh a jabbin' Arnil with his sword; but they finally fixed it up an' went in 'long side o' one nuther, though I b'lieve I was a leetle mite ahead on 'em, a chasin' the sent'nil 'at snapped at Ethin."

"Golly blue! Father 'll be a takin' Canady 'f he gits another underjawful o' Hamner's fightin' rum!" said the veteran's son in mild alarm, and such an exploit seemed not unlikely to be undertaken by the ancient warrior, for he now began to sing in a voice half croak and half whistle, to a small but appreciative audience:

> "'We're a marchin' on tow-wards Quebec,
> Whilst the drums is loudli bea—tin,
> For Americay hes gained the day
> An' the British is retrea—tin!'"

"Bah gosh! Ah'll goin' help it!" cried Antoine, who had been prancing from group to group in search of listeners to what he had to tell concerning shooting. "Dat mek me rembler one tam dey have it shoot-turkey in Canady, an' dey'll ant let you see dem turkey, bah gosh, no! Dey'll have it 'hind a hill of it, an' you'll gat for guess where he'll was an' den shoot. Yes sah! Well, boy, Ah'll was be dere, an' Ah'll se' dawn an' listen for hear, an' bombye pooty soon Ah'll hear dat turkey beegin for gobbler. Houkle, houkle, houkle! Den Ah'll pont up ma gun up so Ah'll tink de ball was drop off where he'll hit dat nowse, an' Ah'll shot off, pluck! 'Squowk!' Ah'll hear dat turkey said, an' bah gosh! You'll ant b'lieved me, dat ball stroke it raght bit-tween hees backs!"

"O, beeswax!" said Dart, "They never hed no turkey shoot in Canady! They uster shoot peas at a kittle, an' the one 'at got the most peas into 't 'ould hev the pot o' pea soup made aouten on 'em!"

"Bah gosh, you'll ant know! You'll never was be dere. You'll gat so far from Danvis you'll can' smell spruce gum, you'll ant never fan your way back! Hein! boy?" Antoine retorted.

Putnam made several ineffectual shots, with each his pride in his gun and his faith in its maker falling and failing. Then Pelatiah tried his luck with the work of the rival maker, but its famed killing qualities seemed to have departed with its deceased late owner, much to the sorrow of poor Pelatiah, whose slender weasel skin held but one half dollar, the proceeds of his fall trapping in the Beaver Meadow Brook, and two more shots would exhaust his scant hoard.

Meanwhile Sam Lovel was out in the woods, where he had been long before the shooting began, in pursuit of Uncle Lisha's promised partridges. The frozen leaves, showing a crinkle of brown and here and there a streak or patch of yet unfaded October red and yellow through the light powdering of snow, were noisy under the lightest tread. The squirrels scampering over them in quest of their Thanksgiving fare, could be heard thirty rods away, and a dozen partridges went whirring and crashing away unseen through the haze of gray branches and dark clouds of evergreen boughs before Sam drew a bead on the head of an old cock who strutted an instant too long on his last spring's drumming log and then verified the truth that pride goeth before a fall as he tossed up a flurry of leaves and snow in his death struggle. So our hunter went on through this range of wooded hill, exhausting its present possibilities of game when he had killed another partridge, but all the while enjoying his solitary tramp. He heard the intermittent popping of the rifles at Hamner's and in soliloquy mildly anathematized the shooters as "a pack o' dum'd fools." In a different spirit Joel Bartlett, hearing the frequent reports as he foddered his cattle in the barnyard, sighed loudly and sorrowfully and said in the sing-song tone that would now certainly be heard next day in the Fifth Day meeting, "A snare of the evil one, an' a-nuther pitfall digged for the feet of the onwary! These men a shootin' at innocent faowls of the air, is a follerin' of a custom, an' a practyse, an' a observance o' them 'at hung Mary Dyer, an' grieviously pussecuted many formerly."

When Sam had come to the top of the hill the shortest

way to the next likely hunting ground lay past Hamner's and a natural curiosity drew him to the shooting ground.

Fortune had frowned on all the contestants but the amiable giant, Dart, who by his weight and good nature and the possibly better gift of luck, seemed always to make his way, and having now got three turkeys Hamner was disposed to debar him from another chance. "I do' know haow on airth I 'm a goin' tu divide three turkeys 'mongst five on us," he said, "but I never was wuth a snap at figgers. Mebby Sary Ann 'll make hash on 'em." Luck, certainly not skill, had taken one of Joseph Hill's bullets into deadly contact with a turkey, and he, following Dart's hint, was telling his friends that M'ri would make a dumpling, the bird to be the core of the savory compound which would have been the stuffing of a larger turkey, "erless she took a notion tu fry it 'long wi' a slice o' pork, same as she would a patridge."

Poor Pelatiah was in doleful dumps, having fired three shots without getting a turkey, and now debating with himself whether he should hazard the remainder of his treasure on another. "I hit a nine-inch ring three times aout o' five, forty rod as I paced it up behind the barn t' hum, yist'd'y, wi' that gun," he confided to Sam, "Widder Wiggins's rifle, the best one the' is in Danvis, so ev'b'dy says, an' tu-day, Samwell, I can't hit a ten acre lot!"

"It's fifty rod f'm here tu that box if it's a rod!" said Sam to Pelatiah, and partly to himself, "the dum'd ol' cheatin' cuss! Look a here, Peltier, if you wanter try agin I'll pay for yer shot if it's a miss. Don't ye be in no hurry. You might," measuring the distance to the hill across the road with his eye, "you might forgit tu put any cap on, an' snap tew three times, an' then hol' high! Aim at the top o' Tater Hill 'f your a minter—'taint nob'dy's business if your shot 's paid for. But don't ye graound your ball this side o' the turkey!"

"Goin', Mr. Lovel?" Hamner asked, as Sam shouldered his ponderous gun, known far and near as the "Ol' Ore Bed;" "I was a hopesin you 'd jine us."

"No," Sam replied, "I can't hit a turkey forty rod off. I'm goin' up on your hill tu try 'f I c'n git another patridge. They 'pear tu be turrible scase t'day."

"Tell ye what, Lovel," said Dart, "I b'lieve Hamner's chick-a-biddied 'em all intu his barn wi' a ha' bushil o' buckwheat, an' sot 'em up for turkeys! These things we ben a shootin' at is patridges, an' the scruff eends o' litters at that!"

"Re-freshmints up tu the hoe-tel, Mr. Lovel," Hamner said, taking no notice of these derogatory remarks; "Meant tu a hed some austers, but I guess they haint hed time to bring 'em raound sence it froze up."

"Was you thinkin' of importin' an auster up here, Hamner?" inquired the irrepressible Dart. "They don't bite, they say, in no month 'at haint got an R in 't, an' the' haint ben quite three sech, so the' haint ben time tu move one up for ye, but I'd druther resk the chance o' gittin' one o' Hamner's turkeys at his forty rod, 'an tu try gittin' an auster aouten a plate o' his soup."

"Naow, *Mis*-ter Dart," Hamner asked, more in sorrow than in anger, "*du* you, *can* you expeck tu git a pailf'l o' solid meats aouten a plate o' austers at nimepunce a plate?"

Sam left the oyster question unsettled and made speedy way to the hill which overlooked the whole range.

Pelatiah bestowed his ungainly length upon the plank once more, and three times pulled the trigger with no responsive explosion of cap and charge. "G—o—s—h!" he exclaimed, with well simulated surprise, "I never thought tu put no cap on!" This oversight having been duly remedied, at the next pull the Widder Wiggins's rifle responded with its wonted spiteful crack, which was more loudly repeated from the hill behind, and the turkey, with a few feeble flaps of its wings, sank upon the box.

"Sam Hill! What an e-cho!" Joseph ejaculated, taking in vain the name of a possible ancestor, and then looking toward the rough steep beyond the road he saw a thin film of smoke wafted upward through the evergreens. After one breathless moment of open-eyed and wide-mouthed wonder, he doubled himself up in a paroxysm of smothered laughter.

When the turkey was examined some one remarked that the "Widder Wiggins's rifle made a onaccaountable big hole," but Pelatiah bore home his prize in triumph and with unquestioned right. ROWLAND E. ROBINSON.

MY RIDE IN A BIRCH CANOE.

TWENTY-EIGHT years ago found me on the shore of the Upper Mississippi, 100 miles above St. Paul, planning a trip down the river to Rock Island. It was in the early spring and the ice had just gone from the river, while the warmth of the northward creeping sun was making daily havoc of the last lingering snowdrifts.

How should I make the trip? The roads were in fearful condition, stage fare was high, and the lonely shores of the upper river were yet unvexed by the discordant screech of the locomotives. I determined to try a birch canoe. Familiar from earliest boyhood with the log canoe or dugout, I had never yet tried a birch. A five-dollar note quickly tempted a Chippewa Indian to sell me the most beautifully modeled canoe I ever tried. It was 12ft. long by 26in. in width, and with a grace of outline possible only to the patient Chippewa. I wonder if such canoes can be found to-day? When I read some time since of a birch canoe formed of the bark of a single tree, gathered in folds at the ends, I could not help smiling as I thought of my old-time birch, with its beauty of model unapproached by any craft I have ever found among civilized men. A delicate framework of cedar, covered with its blanket of birch bark formed of many pieces, cut to fit exactly, and stitched together with slender willows the size of a pipestem, split in two and bent toward the heart of the twigs, as tough almost as a buckskin string. Over the seams on the outside of the boat was spread a coat of pine pitch, and the fairy craft sat upon the water like an egg shell. Stowing my bedding, provisions and cooking utensils in the bow, I added about fifty pounds of stone to their weight to balance my own weight in the stern, and having provided an extra paddle for emergencies I crept cautiously aboard, careful to prevent the bottom of the boat coming in contact with the rocky bank, seated myself in the stern and pushed off. The current was swollen by the melted snows, and the swiftly flowing river, taking the tiny craft in its mighty arms, raced onward toward the Gulf with a speed that mocked the creeping stage coach. Rounding a bend of the stream, I turned to wave a final good-bye to the group of friends gathered upon the shore to see me off, and on we sped, my beautiful boat and I.

And what a graceful thing she was! How quickly we became acquainted. How she responded instantly to the most delicate tip of the paddle. Like a mettlesome steed she seemed alive and trembling with eagerness to obey my slightest wish. How she galloped over the waves of the rapids as with the fiery eagerness of youth I drove her down the watery steep with straining nerve and bending blade, rejoicing to see her display a steadiness and seaworthiness of which I had not dreamed. And well did I need all her grace of outline, all her supple strength, and all her marvelous speed before that voyage ended.

For a time all went smoothly, while the subtle charm of the continually unfolding landscape in front and the gliding panorama on either shore, speeding steadily astern to fold and fade behind me, took full possession of me like some beautiful dream. For hours I floated on upon the bosom of the great river, past shores that bore little or no impress of the coming tide of civilization and which had not yet echoed to the roar of the paddles of the panting steamer. It was a lovely day, bright and warm, with not a breath of air to ruffle the surface of the water, and only the faint rippling under the bow and the tinkling of the water drops from the occasionally uplifted paddle broke the silence of the wilderness and grew gradually into a music, the very monotony of which blended perfectly with the wondrous charm of the surrounding solitude. What enjoyment awaits the canoeist—the true lover of Nature I mean, who finds his pleasure in this silent communion with the lonely goddess. The recollection of that strange canoe ride stirs my blood after all these intervening years.

Rousing at length from my reverie to give chase to a black loon that suddenly appeared in front, a couple of miles more were quickly covered, and my admiration of the staying powers of this strange bird greatly increased when, having many times appeared far in advance, he finally eluded me by a long dive, appearing at length far behind, and leaving me to continue the journey alone. Night approaching I landed, and unloading the canoe, carried it up on the bank, where, having built a fire and eaten supper with the appetite given only to the lover of the open air, I crept under the upturned boat and slept the sleep of the tired canoeist.

Early morning found me again afloat, and soon the straggling village of Sauk Rapids appeared upon the left bank, and the roar of the rapids warned me to land at the upper end of the village, and take a look before venturing upon waters I had never seen.

A couple of men came down to the shore to meet me, and learning that a portage necessitated a carry of three-fourths of a mile, I inquired if it was possible to run the rapids with the canoe. They replied that the Indians sometimes ran them in the spring, in time of high water. "Where do they enter the rapids?" I asked. "Close to the other shore," they answered. What a thing is youth, when touched with the taint of foolhardiness that later years have taught me to be ashamed of. "What the Indians have done I can do," I replied, and without pausing to examine the rapids, I turned the bow of the boat up stream, and with a vigorous use of the paddle succeeded in crossing the stream until within 100yds. of the opposite shore before entering the rapids. A glance ahead caused me to brace more firmly in my seat, take a full breath, and bend to my work with a will, preferring always to run bad water with plenty of steerage way.

Away we went. How the trees along the shore raced backward, and with what inimitable grace did that glorious little canoe avoid each threatening peril and prove herself a credit to the skill of the untaught savage who formed her. May he live a thousand years. The long race was nearly run, and the smooth water of the river below appeared in sight, and I turned to wave a sign of triumph to the men who were watching me from the shore, when I felt the boat plunging downward. Turning instantly, I saw the canoe going over the worst pitch we had yet met, and which had not appeared until that instant. It was nothing dangerous, but about four rods below it, hung something that very evidently was. A long sawlog, escaped from the log-driving lumbermen, had saddlebagged across a rock and the upper end pointed diagonally across the stream to the left directly in my course. The first glance showed the channel to the left, and impassable rocks to the right. I must go to the left, even though the terrible obstruction toward which the boat was rushing with fearful speed, projected ten feet to the left of the canoe's course. In any other boat I had been lost. I had my paddle on the right side of the boat, and bending forward I drew a mighty stroke that whirled the birch like a top to the left until the bow could pass, and then threw my weight on the paddle, which was now braced across the stern, to check the speed and pry the stern over to the left in time. We made it—the birch and I—but with a margin so narrow that, as we shot past and glided down into the smooth water below, my heart rose with a great leap.

Did I remember the lesson? We shall see. The trip from here to the falls of St. Anthony was without incident. There a boom stretched half way across the river above the falls, filled with sawlogs, barred my course and forced me once more to land on the left bank of the river. The great waterfall, 40ft. high, was yet unbroken by dams or aprons and the view was grand. Just at the foot of the fall, within 50ft. of the foot of the precipice, I found a small factory or machine shop on the bank, and making a portage down to this I launched the birch from its steps. For about a mile below the falls were rapids which ran with fearful speed. Forgetting all past perils I pushed off and pulled hard to reach the middle of the stream to avoid the rocks along shore. I gained the middle of the river and the speed became terrific. There were no regular waves, but an indescribable tumult of waters instead. Nearing the foot of the rapids with white water all around us, suddenly the dashing waters seemed to give way under the birch and the angular corner of a mighty rock rose from the vortex of waters directly in front and almost under the boat. Down we went, squarely upon it. It struck the canoe amidships with a blow that crashed through the tough birch and the cedar framework, leaving a hole through which I could thrust my boot. I was pitched forward by the shock until my face almost touched my knees, the paddle flew from my hands and was lost in the foaming waves. Instantly the tumultuous waters closed again, tossing the boat upward like a cork, and on we swept again. Seizing the extra paddle I turned the bow to the left, toward a long gravel bar that lined the shore below the rapids and began a race with the inrushing water that was fast rising around me. I was in dead earnest now, for I well knew that no swimmer encumbered with clothing could live long in that icy flood, and that the stones in the bow of the birch would take her down like a plummet. Keeping the bow down stream to get the help of the current I paddled for life, and when the boat grounded on the gravel, I sat in the ice cold water that rose to my waist, and not two inches of the gunwale of the faithful birch showed above the surface. Jumping out I unloaded the boat, emptied and carried it up on the shore, turned it bottom upward, straightened out and fastened the broken bark, made a fire and warmed the kettle of pitch I carried in the bow, paid the broken seam, and again the little birch was tight and dry as a milk pan.

Wringing the water from my wet blankets I spread them on the bushes in the sunshine until partially dried, when I loaded up and started on. Coming to the mouth of the little stream that flowed down from the falls of Minnehaha, I landed and walked up to the beautiful waterfall, and for an hour stood and drank in the beauty of the lovely scene, as yet untouched by hand of vandal. I have never seen it since nor do I wish to. Years after I saw a painting of Minnehaha, after the stupid attempt had been made to "improve" it; and I could only regret that the loveliness of that wonderful scene had been so marred. Returning to the boat I paddled on down to St. Paul where I landed to secure supplies. A man soon appeared eager to buy the little birch. He proved to be the steward of a small stern-wheeled steamer named the Hazel Dell, from Pittsburg, Pa., and desiring to take a birch canoe back to his friends at home, offered me my passage to Rock Island on the steamer in exchange for my boat. The bargain was made and the voyage ended, when the beautiful little birch, the only one I have ever owned, was carried in triumph to the hurricane roof of the steamer, no longer springing forth to the stroke of the paddle, but trembling with the motion given by the steam engine of civilization, started her long journey to Pittsburgh. UNCLE FULLER.

THETIS, Wash. Ter.

ON THE WEST COAST.—II.

THERE are singular features in all the rock formation of the keys. Below the surface of the water, where it is covered with mud, a stiff pole can be shoved into the rock to a depth of a foot or more. On the keys under the soil it can be cut with an axe, showing a perfect coral formation. The branch coral, under deep water ten fathoms or less, is hard and brittle, and seems on close examination to be in active formation by the coral insect. I know of no prettier marine sight than a favorable view through a sponger's glass of the bottom, covered by branch coral, as white as snow in all its beauty.

We filled up our empty water vessels, and laid in some yams and fresh tomatoes and some cocoanuts. Each settler has his own cocoanut grove. Bidding farewell to Key Vacas, we headed N. E. for lower Mattacomb Key, distant about 25 miles; wind S. E., thermometer 72, passing on our left Horse Neck, Lemon, East Horse Neck keys; on our right DeWitt, Estella, Duck and Long keys, some of them habitable and others entirely covered with mango trees, the limbs of which have a peculiar feature of growing downward through water and mud, and striking new root, the beginning of a new tree. They grow either in brackish water or the blue salt water of the Gulf. Here we found a landlocked harbor off the lower west end of the key, formed by a circle of bars, and we entered by a narrow channel, perfectly secure in every direction and in plain sight of Alligator Reef Light, and in hearing of the loud roar of the breakers as they dash on the lighthouse reef. We killed with the grains in the day's run three sharks, one swordfish and two large skates, and caught an abundance of kingfish, some of them going as high as 25lbs. They were taken with the trolling lines procured from Key West, all of our bluefish squids brought with us having long since been used up; they are entirely too light for key fishing. Grains for spearing fish are made with two sharp parallel prongs 6in. long, with barbs inside, fastened to the usual harpoon socket, for receiving a 14ft. pole, straight, tough and light. Six feet of small chain are fastened to the socket, a line is fastened to the chain, the end of the pole is placed in the socket, the line is hauled taut and two half-hitches are taken around the upper end of the pole, which holds the grains in place. When the fish is struck it springs forward; this unships the pole, and then commences the mad race. If you have fastened well into a big one and you are in the dinghy, you will be kept too busy for a half hour to answer many questions in your endeavor to keep your boat on her bottom and bring in your fish.

Our guns had not been idle. We had with us one 10-bore shotgun, one .44-cal. rifle and two heavy revolvers, which were not of much use. We had killed deer, pelicans, cranes, cormorants and a great many varieties of snipe; in fact since we left Key West we have not been out of the reach of fowl or fish, although we have taken more pleasure in the sailing than in either fishing or shooting. The climate is simply superb. The prevailing southeasterly trade winds keep the temperature very even. The nights are perfect. The tent is dry in the morning, not enough dew falling to dampen it; in fact the only objectionable features of the keys, as far as visited, are the mosquitoes in the early morning and evening. Still we managed to keep them out, so we could not complain. This strikes me as being the perfection of climate for all pulmonary complaints. The inhabitants enjoy excellent health and show healthy complexion and clear eyes, so different from what we observed in the mainlanders—the name by which the key people know the rest of the Floridians.

Our cable having too much scope we swung with the tide and grounded on a bank during the night; taking a list she dumped the artist out on the floor, he, grumbling and half asleep, made a dive for his bunk, only to roll out again on the floor. We found a flight of snipe along the bars with a good many duck, so taking our guns while the cook was preparing breakfast, we went ashore. The artist, as usual, sitting down and making a sketch. I succeeded in killing a good bag of snipe of several varieties. We then stood on for Key Largo, the largest of all; with a stiff breeze abeam we made reckoning on reaching Tavernier Creek about noon. We had run about five miles when we brought up all standing on a

bank. Seeing a forlorn chance of getting afloat in the next hour or two, I jumped into the dinghy with the grains and poled over to the first channel through our bank. I did not have long to wait, for along came a big shark. He saw me about the time when I let drive the grains. Striking him fair in the back, he darted off, making the line hum as it went over the bow. I went down in the stern, grasping the line in both hands, having it rove through the ring in the stem. I waited for the strain; it came soon enough and at right angles to fore and aft, slewing the little boat around. We went off with a rush, making a wake like a tow boat. It was all right enough as long as he stuck to open water, but the rascal, he dodged through the channel, turned the corner and stranded me on the bar, he kept right on with the grains. This made the second pair lost.

After warping the Bessie off the bar we continued on our course for the creek, missing it by standing on too far and getting our bearings on Low Key; we about ship and finally found it by running on a mud flat at its mouth, hidden by a small mango key. The artist and I took a run up the creek to make observations and found it alive with fish and game. On passing through the creek with the Bessie we had the tide against us, which gave us plenty of exercise with the poles. We worked through to the south side of Key Largo, and stood N. E. for Captain Albury's plantation, where we received a very hearty welcome indeed. He has a large number of acres under cultivation, raising tomatoes, bananas, cocoanuts, pineapples, etc. This was the first and only place where I saw pineapples thriving. They can be profitably cultivated as far north as Key Biscayne Bay Keys, for profit but not further north. The land is very broken and stony, and one can step from stone to stone. The soil is remarkably fertile, the produce growing to perfection. We passed a very pleasant afternoon and evening with the family. The next morning they would insist on loading us up with an abundance of the good things from their gardens, one bunch of lady finger bananas being all our cook could carry. We had no pilot now, as we could find the bottom about as readily as he could, so we turned him into a cook without prejudice. The pineapples, ripe and just off the plants, were fine.

We were next bound for Taylor's River on the mainland, west of north from Tavernier Creek. Although the captain told us we drew too much water to reach it, we were bent on trying, so running back through the creek, with fair wind, we ran north for Taylor's River, keeping to the westward of Low and Walker Keys. After sailing along a narrow sand bar for several miles, we ran through a narrow channel about 15ft. wide and entered Barne's Sound. We found Taylor's River at sunset, after a two days' run. We passed very many game birds on the bars or wading in the shoal spots, including a great many flamingoes, curlews and plover, ducks and cranes. Here we saw our first alligators, there were lots of the bulls bellowing all night. The banks of the river are low and composed of hard yellow clay, which had the appearance from a distance of being rock. All sand and stone had disappeared, and there was nothing but the softest kind of mud on every hand. We cruised up the river for a whole day. The water was about 10ft. deep and 200yds. wide, the low banks covered with palmetto and cane brake growth, and occasionally a broad savannah dotted with islands. Probably in the wet season the whole country is under water; I saw high water marks 10ft. above the banks. It is the most forsaken and forlorn place I ever beheld. The color of the water is brown, the current sluggish and all one way, showing it to be one of the many outlets of the great everglades and lakes of southern Florida. So we left without regret, although it had at first interested us very much.

Passing along to the westward, we looked for Altahoochee River, which is a cut off, leading from Barne's Sound into White Water Bay. Following each bar and shoal we were gradually forced to the southard and then eastward, when we became convinced that Capt. Albury was right. Then to get back was the next move, which it took two more days to accomplish. From the gaff I saw two porpoises near at hand; trying a shot at them with the rifle, they headed outward and ran through a small channel that we had passed, and which proved to be the one we had passed through four days previous, so then and there we toasted the two new pilots with a will as they disappeared to the southward showing us the way to deeper water.

Again arriving at the channel through the long bar off Tavernier Creek, after an absence of several days cruising we were more than convinced that a boat drawing more than 14in. of water is not suitable for key cruising.

Our next course was southwest, back to Duck Key and then northwest to Cape Sable, passing between West Horseneck and Middle Shoal and west of Sand Key, reaching Cape Sable at sunset of second day. Part of the time we were out of sight of land with 4 to 6ft. of water; distance run, two days sailing from Indian or Channel Key to Sable forty miles. We found a harbor off a creek at Northwest Cape and had an all night drumfish serenade under the boat's bottom. Our tent in the morning was wet with the dew for the first time.

Ran into Harney's River next day. Shot two pink curlews—a beautiful bird. Saw hundreds of alligators. By shooting from the gaff they can be killed as they swim. This is a difficult thing to do from deck, for they only show their eyes and the tip of the nose above water. The ball from deck is apt to skip, when a plunging shot from aloft will kill every time. The 'gator sinks, turning his yellow belly up, and can be easily seen and picked up on one's return several hours afterward. We saw any amount of deer tracks on shore, and finding a crossing on the river we killed two in the evening of about 100lbs. each, a buck and doe. The mosquitoes after sunset are dreadful; with the hooting of the owl and the bellowing of the 'gators it keeps things pretty lively after nightfall. This is another river full to the brim of everglade water running through a perfectly flat country covered with tall grass and canebrakes, in which lurk bears, deer, wildcats, rattlesnakes and moccasins by the thousand. We see them every day and with the 'gators to keep it lively it cannot be a very nice place for a nervous person to reside in. The artist has a great fondness for bathing, which he gratifies by stripping in the dinghy towing astern, then taking a pail of water and having a shower bath. He went over backward yesterday (the maneuver being caused by a sudden jerk on the painter) into about 10ft. of water, which was alive with sharks. He lost no time in getting on board the dinghy when we cast off the line; ordinarily he is the most deliberate man I ever saw; some might call it laziness, but he forgot his deliberation for a minute.

Running up the several rivers in passing along the coast we found a great similarity in scenery. We stopped at different favorable points on the beach, sometimes for a sketch by the artist, and again for wood for the stove. I have long since on former cruises thrown overboard the oilstove, with all its nastiness. My attention, while walking along the sandy beach hunting rare shells, was one day attracted by the wild exclamations of the artist, who as usual had lingered behind sketching a cabbage palm. Running back and looking to where he pointed I saw rising above the tough beach grass the heads of two large rattlers. Beside them lay the artist's sketch book, and to this day it has remained a mystery why he was not bitten. Keeping at a safe distance he asked me to hold them while he got the gun out of the sloop. He brought the shotgun and I gave them a barrel apiece, which finished them up in fine shape, and we soon had them stretched out on the sand alongside of tape line. One had twelve rattles and measured 6ft. 5½in., the other nine rattles and measured 6ft.; one measured 14in. in circumference; the odor from them was immense.

At the Ten Thousand Islands we entered one of the many channels, first at low tide fishing up a bag full of oysters. We cruised among the islands for two days, when after the second day it was only by close attention to the compass that we found our way out of the labyrinth of deep channels all full of brown swamp water. Some of the islands at a distance showed the foliage as white as snow, from the droppings of the birds, for here were the roosts of millions of birds of many kinds. Chocoliska and Casimba keys each contain one immense shell mound, perhaps 100ft. in diameter and 50 to 75ft. in height. There are smaller ones further up the coast. On digging into them we found several kinds of shells perhaps carried there by the Indians. These are the first elevated grounds north of Cape Sable. They are occupied by spongers. At several places in the vicinity there has been a feeble attempt at cocoanut and sugar-cane growing. The soil is rich enough, but the annual overflow causes very uncertain results. It is hard to remember that it is winter, with such perfect weather, enjoying every hour as we cruise along, finding plenty of harbors and a surfeit of game and fish. A full account of all our experience would fill a volume. V. W.

Natural History.

Address all communications to the Forest and Stream Pub. Co.

"OFFICIAL EXTERMINATION."

Editor Forest and Stream:

In FOREST AND STREAM for Feb. 3 is a communication entitled "Official Extermination," and signed "C. H. H.," which severely criticises Mr. C. H. Townsend for having been instrumental in procuring for the U. S. National Museum the skins and skeletons of sixteen sea elephants. Prof. Baird is also condemned by the author for having instructed Mr. Townsend to obtain these specimens. As Mr. Townsend is by reason of absence unable to speak for himself, I take the liberty of briefly replying for him and furnishing "C. H. A." with the facts in the case.

Mr. Townsend, while in San Francisco, made arrangements with the owners of the schooner Laura to accompany that vessel on a sealing trip, for the purpose of obtaining sea elephants, a liberal offer having been made in order that the skins and skeletons of such as might be killed should be preserved for scientific purposes instead of being made into commercial hides or thrown away. This trip was unsuccessful, and Mr. Townsend returned to Washington, leaving his offer still open. On the next trip of the Laura sixteen sea elephants were killed and preserved, although owing to the unfortunate absence of Mr. Townsend the skeletons were rather roughly prepared, and reached Washington in a decidedly mixed condition.

This act of "official extermination" thus resolves itself into the fact that a price was placed on the skins and skeletons of sea elephants sufficiently large to induce the dealers to save them instead of allowing them to rot upon the beach. But for the foresight of Prof. Baird and the energy of Mr. Townsend there would be to-day hardly a specimen to show that this huge animal ever existed, and Mr. Townsend is to be congratulated on having secured for science even a few immature individuals of this, our largest pinniped. Had the critic's assumptions been correct and the "final tragedy" taken place under the eye of Mr. Townsend, it would still have been far better to have secured all the specimens possible for scientific purposes, although at the risk of exterminating the race, than to have left the survivors to the tender mercies of the seal hunters. "C. H. A." himself bemoans the fate that befell the rhytina, the dodo and great auk, and yet he equally bewails the fact that the sea elephant has been rescued from the same rapidly impending doom. For doomed this huge animal was from the moment of its discovery, both by habit and location, and its final extermination has been merely a question of time, and of very little time at that. There is no case on record where sentimental considerations or even a chance of possible future profit has spared the life of a single creature whose death would cause the immediate gain of a single dollar. "After us the deluge" seems to be the motto of the American race, and the sea elephant does but mark the path of extermination down which so many denizens of our woods and waters are being hurried. We learn from Mr. Townsend's paper how the few animals spared by the Liberty in 1884 were promptly swept out of existence by the crew of the next vessel to appear upon the scene, and it is too easy a matter to imagine how long would have been the lives of any spared by the Laura. Lower California is quite beyond the jurisdiction of the United States, but did the territory lie within our boundaries it is the merest folly to suppose that the law which is powerless to protect the seals on the Farallone Islands could do so anywhere else.

From the sixteen individuals secured, specimens have already been sent to the British Museum, to the Museum of Comparative Zoology, the American Museum of Natural History and the Philadelphia Academy of Science. It is just possible that "C. H. A." would prefer that these skins should have been made into leather and their bones left to whiten on the shore, but it is to be hoped that this supposition is not correct. No one deplores the destruction of animals more than does the present writer, and yet he deems the slaughter of the sea elephants not only justifiable but commendable. F. A. L.

WASHINGTON, Feb. 20, 1887.

NAVAJO METHODS OF CURING AGUE.

BY DR. H. C. YARROW.

[Read before the Anthropological Society of Washington.]

FROM the earlier periods of historic time up to the present day, the practice of medicine has partaken largely of an occult and superstitious character, which does not, even with more advanced mental enlightment, improve as we have reason to expect. To-day we hear among our own people of faith and prayer cures for the relief of disease, of the laying on of hands, and of the miraculous effect of certain waters, charms, relics and conjurations, and this being the present civilized status, we should with all charity be tolerant of the peculiar views held with regard to the cure of physical and mental disorders by the Indian doctor and his patient.

No one will venture to say that the earlier physicians sprang into the performance of healing functions at once; the growth of the art has been gradual, and largely empirical, and this has been the case not only with the more civilized races, but also with the savage ones. It is true, as has been stated by our distinguished president and others, that the Indian has no absolute and definite knowledge of the causation of certain diseases, believing that many of them are produced by evil demons, spirits or gods. But that he is absolutely ignorant of the cause and effect with regard to remedial agents I do not believe. If we deny empirical observation to the Indian, we must then ascribe to instinct alone the faculty he evinces in choosing certain herbs, or other medicinal substances for the care of his ailments. Animals are their own physicians, and it must be instinct or transmitted hereditary experience which leads them to select particular plants and herbs to relieve occasional ill health. The question may well be asked, what part do instinct and experience play in this choice? Any one familiar with the gradual progress of medical science must admit, if not biased by the views of a particular school, that etiology is not of prime necessity in therapeutics, as we find different men of different pathological views, prescribing opposites quite frequently and having equally good success.
